**R. B. LAIRD AND SONS** can recommend with every confidence Scotchmen thoroughly qualified as GARDENERS, FORESTERS, or LAND STEWARDS, either for large or small establishments, and will be pleased to furnish full particulars on application.—17, Frederick Street, Edinburgh.

**To Noblemen and Gentlemen requiring Land Agents, STEWARD, BAILIFFS, or GARDENERS.**

**JAMES CAITER AND CO.** have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter. Enquiries should be made to 237 and 238, High Holborn, W.C.

### SCOTCH GARDENERS.

**S. JOSEPH DOWNIE** (of the late firm of Downie & Laird, Seedsman, 144, Princes Street, Edinburgh, has at present on his List a number of SCOTCH GARDENERS, waiting engagements. He will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman requiring a trustworthy and competent Gardener.

### RICHARD SMITH AND CO.

beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

**J. AND R. THYNE, NURSERYMEN**, Glasgow, can always RECOMMEND MEN of known character and ability as GARDENERS to any Lady or Gentleman requiring such. Applications solicited.

**GARDENER (HEAD).**—Age 30, single; eleven years' experience. Excellent references; last five years at Waddesdon Gardens, Barrow de Rothschild, M.P.—M. C., Gordon Villa, Goldsworth Road, Woking, Surrey.

**GARDENER (HEAD);** age 32.—The ADVERTISER has had twenty years' experience in the best Noblemen's and Gentlemen's Gardens in England. For the last five years Foreman at Great Geiries, under Mr. Douglas. Highly recommended.—H. Y., Great Geiries, Ilford, Essex.

**GARDENER (HEAD).**—Age 36; twenty-one years' practical experience in first-class establishments. Exceptional testimonials and references from present and previous employers.—W. AND J. BROWN, Nurserymen, Grantham.

**GARDENER (HEAD),** where another is kept, Age 28, married, no family; sixteen years' experience in the general routine of Gardening, and excellent character from present situation. Suburbs of London preferred.—J. THURGOOD, The Lodge, Loudwater House, Rickmansworth, Herts.

**GARDENER (HEAD).**—Age 35, married; twenty years' practical experience in Early and Late Forcing of Fruit, Flowers, and Vegetables, the Cultivation of Stove and Greenhouse Plants, Orchids, &c.; also Kitchen Gardens and Pleasure Grounds. Good character.—J. FINLAYSON, The Gardens, Combe Bank, Sevenoaks.

**GARDENER (HEAD);** age 30, married (having a child);—D. MACKEY, Gardener to the Right Hon. Sir Massey Lopes, Bart., can with confidence recommend his Foreman, E. DAVE, to any Lady or Gentleman requiring a thoroughly practical good Gardener. Fifteen years' practical experience.—Maristow, Roborough, Devon.

**GARDENER (HEAD);** age 34.—Mrs. ANDERSON, Waverley Abbey, Farnham, Surrey, wishes to recommend her Head Gardener (who was with her for 17 years) and to any Lady or Gentleman requiring a good practical Gardener. Twenty years' experience in large establishments.—S. P., Upper Shore, Gravesend, Kent.

**GARDENER (HEAD),** where two or more are kept; age 30, married.—A LADY wishes to recommend her Head Gardener as above; thorough practical experience in all branches, Early and Late Forcing, Flower and Kitchen Gardens. Highest references from previous employer.—J. M., 27, Myrtle Terrace, Weymouth, Dorset.

**GARDENER (HEAD).**—G. HALL, for nine years Gardener to the Duke of Devonshire, Tavistock House, and previously Foreman at the Duke of Cleveland's Raby Castle, is open for re-engagement. Left through death of employer. Twenty-two years' first-class experience. References to the highest order.—G. HALL, 11, Tipping Street, Altrincham.

**GARDENER (HEAD WORKING).**—ALFRED KEMBLE, Bechborough Court, Cork, offers his services as above. Thoroughly acquainted with every branch of Gardening; and first-class references. English and Protestant.

**GARDENER (HEAD WORKING).**—Age 29; abtainer; thoroughly experienced in Flowers, Fruit, and Vegetables; good at Chrysanthemums. First-class personal character.—J. R., 10, Cromwell Road, Tunbridge Wells.

**GARDENER (HEAD WORKING).**—Age 35, no family; thoroughly experienced in Early and Late Forcing of Fruits, Flowers, and Vegetables, and Growing for Exhibition, &c., and general routine of Gardening.—GEO. HOLLS, Witton, North Walsham, Norfolk.

**GARDENER (HEAD WORKING).**—In the prime of life, unmarried; trustworthy, and thoroughly competent in all branches. Abtainer. Five years' excellent character, also testimonials.—M. M., 283, King's Road, Chelsea, S.W.

**GARDENER (HEAD WORKING),** where one or two others are kept.—Age 48, married; thirty years' experience. Understands Vines, Greenhouse, Flower and Kitchen Gardening. Can have twenty years' good character from present employer.—GARDENER, Trafalgar, Salisbury.

**GARDENER (HEAD WORKING).**—Age 41, married, no family; thoroughly trustworthy. Experienced in Stove and Greenhouse plants, Vines, Flowers, Fruits, and Vegetables, and in general routine of Gardening. Leaving through death.—W. CROSSMAN, Farnside, South Wales.

**GARDENER (HEAD WORKING).**—Age 35, married over twelve years, no family; twenty years' good practical experience in Fruit, Flowers, and Vegetables, Stove and Greenhouse Plants. Good character. Wife no objection to help in any way required.—F. RAPPLEY, The Lodge, Chitcliffe, Liphook, Hants.

**GARDENER (SINGLE-HANDED, or SECOND).**—Married; eight years' experience in Houses, Kitchen and Flower Garden. Good character from last and previous employers.—F. EARLEY, Woolton Hill, Newbury, Berks.

**GARDENER (SINGLE-HANDED).**—Middle-aged, married, three children (youngest 10 years); good character. Understands the Management of Sheep and Cattle; can Milk, besides the ordinary Garden Work.—GARDENER, Chetwode Manor, Buckingham.

**GARDENER (SECOND),** where four or five are kept.—Eight years' good character.—W. H., [Mr. Goodman, Postman, 33, Prince Street, Swindon, Wilts.

**GARDENER (UNDER),** in a Gentleman's Garden.—Age 19; good character.—ROBERT WOODMAN, Escher Post Office, Surrey.

**GARDENER (UNDER).**—Age 22; four years' good character.—J. MASON, The Gardens, Donnington Grove, can with confidence recommend a young man as above.

**FOREMAN in the Houses.**—Age 24; four years in last place. Well recommended.—C. TINDALL, Dorington, Lincoln.

To Florists and Market Gardeners.

**FOREMAN (WORKING).**—Age 44, married, no family; good Propagator and Grower. Thorough energetic and pushing man, of long and varied experience. Good character from present employer. Kent or Midland Counties preferred.—A. T., 41, Wellington Street, Strand, W.C.

**FOREMAN, or SECOND.**—Age 27, married; thirteen years' experience. Well recommended from all previous employers.—FOREMAN, 4, Doveclade Place, Pinner Road, Sudbury, Harrow, N.W.

**FOREMAN and PROPAGATOR.**—Age 34; high references.—G. L., 2, Sharp's Buildings, Tower Hill, E.

**NURSERY FOREMAN (GENERAL).**—Practical knowledge of the business in all its branches. References, &c., J. MUNRO, Northfields, Stamford, late of the Upton Nurseries, Chester.

**JOURNEYMAN, in the Houses.**—Age 19; five years' experience. Good character.—W. ELLIOTT, The Gardens, Guy's Cliff, Warwick.

**JOURNEYMAN;** age 21.—Mr. BENNELL, Gardener to Sir J. Radcliffe, can recommend a youth as above. Abtainer; Catholic.—The Gardens, Ridding Park, Knaresborough, Yorkshire.

**JOURNEYMAN, in the Houses;** age 22.—Mr. MILSON, Gardener to the Right Hon. Sir Harry Verney Bart., will be pleased to recommend a young man as above. Five years' good character.—Claydon Gardens, Winslow, Bucks.

**JOURNEYMAN, in the Houses.**—Age 22; seven years' experience. Four-and-a-half years in present place. Good character.—F. BENGOUGH, The Gardens, Signall Hall, Eccleshall, Staffordshire.

**MARKET GARDENING, under Glass.**—A young GENTLEMAN with Farming experience wishes to leave above business, near London. Moderate premium.—Apply C. M., Barrow, or G. W. 59, Gresham Street, E.C.

**TO NURSERYMEN.**—Situation wanted by young man well up in Soft-wooded Stuff and Ferns. Good references.—RYSON, 51, Thorne Street, Wandsworth Road, S.W.

### HOLLOWAY'S OINTMENT AND PILLS.

Counsel for the Delicate.—Those to whom seasons of changeable temperatures are protracted periods of trial should seek the earliest opportunity of removing all obstacles to good health. This cooling Ointment persistently rubbed upon the skin, is the most reliable remedy for overcoming all diseases of the throat and chest. Quinsy, relaxed tonsils, sore throat, swollen glands, ordinary catarrh, and bronchitis, usually prevailing at this season, may be arrested as soon as discovered, and every symptom banished by Holloway's simple and effective treatment. This Ointment and Pills are highly commended for the facility with which they successfully counteract influenza; the ally in an incredibly short time the distressing fever and teasing cough.

NONE IS GENUINE THAT DOES NOT BEAR OUR NAME ON THE SACK.

# THOMSON'S

## IMPROVED

# VINE, PLANT, AND VEGETABLE MANURE.

AWARDED ONLY MEDAL FOR ARTIFICIAL MANURES  
AT EDINBURGH INTERNATIONAL EXHIBITION, 1886.

This Manure, on its own merits, has come rapidly into extensive use. The materials it is composed of are of the highest manurial value, and so balanced as to combine immediate with lasting effects. It is a safe and certain Manure for every fruit-bearing plant from the Vine downwards, as well as for Pot Plants and Vegetables.

## HUGHES' Soluble FIR TREE OIL

**FLORISTS and NURSERYMEN SHOULD NOT BE WITHOUT IT.**

Unsurpassed as an insecticide, it kills effectually all parasites and insects which infest plants whether at the roots or on the foliage, without injury to tender plants—such as ferns, etc., if used as directed. Used as a WASH it imparts the gloss and lustre to the foliage which is so desirable on exhibition specimens.

Dog Fanciers should not be without it! It makes a silky Coat and produces healthy Skin Action; kills fleas, and is excellent for washing dogs.

Housewives should not be without it! Used with ordinary household soap it is an effectual DISINFECTANT, BLEACHER, and CLEANER OF FABRICS. It kills insect life on man, animal, or plant, without injury to the skin, wherever parasites may appear.

Sold by Seedsmen and Chemists, 1s. 6d., 2s. 6d., & 4s. 6d.; ½ gallon 7s. 6d., 1 gallon 12s. 6d., or less in larger quantities.

A Treatise on FIR TREE OIL as an INSECTICIDE, its application to Plants and Animals, Post free on receipt of address, by the Manufacturer.

**E. GRIFFITHS HUGHES**, Manchester. WHOLESALE from all the London Seed Merchants, and Patent Medicine Houses.

**NEW YORK—ROCKEY and SONS.**

**JAMES VEITCH & SONS**

*Beg to direct special attention to this Sterling Novelty,  
now offered for the first time.*

This strikingly beautiful decorative plant commences to flower at Christmas, and continues in bloom throughout January and February, and is a most welcome addition to the winter flora; its bright and pleasing colour being very attractive during the dull winter months.

The plant was recently introduced from South Africa, is of easy culture, very floriferous, and succeeds well in a temperature of 50° to 55°; it attains a height of about 18 inches, and is of good bushy habit.

The flowers, which are borne in large clusters, are of wax-like consistency, last a long time in perfection, are of a beautiful delicate pink colour, and, in addition, are deliciously fragrant, which greatly enhances the value of this charming plant.

Retail Price, 1s. 6d. per packet. Trade Price on application.

SATURDAY, NOVEMBER 24, 1888.

**THE CHRYSANTHEMUM.**

IT has been remarked by competent observers that the incurred varieties of the flower show some slight falling off as regards quality, while a corresponding advance has been noted in Japanese varieties. The progress of the latter during recent years has been marvellous, and one may well ask the reason for this phenomenon. The ground for it is not far to seek, as those who undertake the raising of new Japanese varieties are not bound down by any rules or to any form of flower or petal; the last may be narrow or the reverse, twisted, straight, reflexed or curled inwards, or all of them together on the same flower. The new seedling must be an object of beauty in itself, and commend itself to the public, who are willing to pay for it; but as usual with the demand comes the old cry of over-production; there are far too many candidates for popular favour—too many seedlings sent out from one firm. The good old English custom of selecting something like half-a-dozen new varieties from a large batch of seedlings to send out is being departed from here, as in other things. Last year as many as 130 new varieties were sent out as the production of one firm; but here again purchasers have to a large extent the selection in their own hands; they can refuse to purchase new varieties until they themselves have seen the flowers, or until they have been seen by some one competent to form an opinion. There are so many really good varieties already in cultivation, and most collections are already so overcrowded with names, that there cannot be any great hurry to increase their number. I act on this principle, and never purchase a new plant until I have seen it; others may not have so many opportunities to see and judge for themselves; but the horticultural Press well supplies this want.

A word as to the slow progress in raising new incurred varieties. As a matter of fact, there are not any attempts being made that I can hear of to raise seedlings from incurred flowers. The subject is talked about at the exhibitions every year, but no one seems to be enterprising

enough to make the attempt. I have been told that seeds cannot be obtained. Probably not, in this country; but there are other things besides *Chrysanthemums* of which no seeds can be obtained in England. They can, however, be obtained on the northern or southern shores of the Mediterranean. There is yet ample room in incurred flowers for greater diversity of colour, on the lines of more brilliancy, and, moreover, decided shades of crimson, pink, and rich purple are required, with the size and the form of *Empress of India*. Such flowers should be worth years of patient hybridising to obtain.

Mr. Holmes, with his keen insight into the fitness of things, has reminded us that for all practical purposes the year 1889 marks the centenary of the introduction of the *Chrysanthemum* into Europe. It had been introduced two centuries ago, and was also cultivated about the middle of the last century by Miller, of the Botanic Gardens, Chelsea. The plant was evidently lost to cultivation until it was re-introduced by a certain Blanchard, of Marseilles, in the year 1789. When it was introduced to England, I am unable to say—probably very soon after, for we find it was cultivated by Colvill, nurseryman, King's Road, Chelsea, in 1795: a purple-flowered variety flowered with him in November of that year, and it was figured in the *Botanical Magazine* for 1796. It has no distinctive name, and is merely designated *C. indicum*.

Mr. F. W. Burbidge, in his excellent treatise on the *Chrysanthemum*, states, in a note at p. 3, that the *Botanical Magazine* figure resembles in all respects very closely the variety named Dr. Sharpe. I have Dr. Sharpe now in flower, and have compared it with the plate, and the resemblance is very striking, and is equally marked in the half-opened buds. No other variety was known to Curtis as being cultivated in England. His remark, that "We rejoice in the opportunity afforded us of presenting our readers with a coloured engraving of a plant recently introduced to this country, which, as an ornamental one, promises to become an acquisition highly valuable," were prophetic.

If it is intended to commemorate the introduction of this plant by a centenary celebration, no doubt the united wisdom of those best able to judge will be called into requisition, and something be done worthy of the occasion. The probability is, that some extension of the ordinary flower-shows might be suggested; this is all very well in its way, and may be a good adjunct to something else. A Conference might be attempted, and a complete collection of varieties might be grown in one place. At a preliminary meeting held at the Crystal Palace, at which Mr. Sanderson presided, it was thought that sufficient time would not be available to organise the whole thing in one year, and that it would be better to celebrate the centenary in 1890. It was stated at the meeting that the plant was introduced from France to England in that year, consequently it would be even more suitable, than the earlier date.

At some shows where I have acted as judge, the specimen plants have not been of such good quality as they were about fifteen years ago. Some varieties do not make very strong growth, and yet when well managed they make excellent specimens. A pretty variety named Little Pet, with bluish coloured incurved flowers; *Aurea multiflora*, yellow; Lady Hardinge, peach colour; Antonelli, Dr. Sharpe (reflexed), and one or two others are of this class, and should be grown from old roots. The plan is to grow the varieties required with tall stems to produce large blooms, and at this season of the year they will sometimes produce shoots from the old stems, an inch or two above the surface of the ground. The old stem should be cut over close to the top growth, the plant dug out of the pot with a trowel, and the shoots that are pushing from the base of the plant removed. It should be potted in a 7-inch pot, in good soil and be placed near the glass in a greenhouse. The plants should

be kept from frost during the winter, so that they may be kept growing in what may be termed a cool greenhouse temperature. They should be put into 9-inch pots, and about the end of May into 11-inch pots, and in these they will produce their flowers. Mrs. George Rundle, and the sports from it do best from cuttings put in at once. All the pompon section succeed best from cuttings. *J. Douglas.*

## EUCALYPTUS VIMINALIS.

The specimen figured at fig. 82 was obligingly sent to us by Captain Brown and the Rev. D. Landsborough, from the Island of Arran, under the name of *E. amygdalina*. On referring the specimen, however, to M. Naudin, of Antibes—who not only has a special *Eucalyptus* herbarium, but also cultivates a large number of species in the open air—we were informed by that eminent botanist that the specimen in question was *E. viminalis*. Turning to Baron von Mueller's *Eucalyptographia*, we find this called the Manna Eucalypt, by reason of the mannalike substance which exudes in drops from the stem in consequence of the puncture of a kind of grasshopper (*Cicada morens*). The manna in question is, however, of little medicinal value. The tree in a wild state extends through New South Wales, Victoria, and Tasmania, attaining a height in some cases of 320 feet, with a base of 17 feet in diameter. It grows in poor soil, and flowers when in a young state. The branches are slender and pendulous. The leaves are linear-lanceolate, and the flowers are borne in axillary three-flowered shortly stalked cymes. The flower-tube is oboconical, the flower whitish. The tree from which our figure was taken was sown in 1872, and is now 30 feet in height and 16 inches in girth at 5 feet from the ground, and it would probably have been larger, but that it was transplanted ten years ago.

## NEW OR NOTEWORTHY PLANTS.

### LÆLIA PACHYTELE, n. *hyb. nat.* (?)

MR. R. H. MEASURES has kindly sent me an inflorescence, originally three, then two-flowered, of a plant that is said to have the growth of a middle-sized *Lælia* elegans. It was imported by Mr. Horsman, Colchester, and appears to flower twice a year. "No one who has seen it here can tell us what to call it." These are the *ipsissima verba* of Mr. R. H. Measures.

The flowers are equal to those of a rather good *Lælia* elegans. The petals are broader than the sepals, and wavy, wholly light rose. The lip is very narrow. Side-lacinia long, narrow, nearly rectangular, white, with light purple borders, broadest on the projecting angles. Mid-line of the disc with a purple line from the base of the mid-lacinia to the base of the lip, then divided into two shanks. Mid-lacinia narrow, oblong, acute, projected, rose, with darker purple veins, which looks exceedingly pretty, and which gives a peculiar aspect to the plant. Column very plump, white, with purple on the back, and with two broad ligulate marks running from the stigma to the base. Pollinia very unequal. *H. G. Rehb. f.*

### CATTLEYA CASSANDRA ×, n. *hyb.*

This is another of Mr. Seden's hybrids, for which I am indebted to Messrs. Veitch & Sons, of Chelsea, from whom I have just received a three-flowered peduncle. It was raised from *Cattleya Loddigesii*, fertilised with the pollen of one of the forms of *Lælia elegans*; itself a *Lælia*-*Cattleya*, that is, a natural hybrid between the two genera. The seed was sown in 1877; so that it has taken eleven years to reach the flowering stage.

At present the plant is said to have a stoutish rhizome, as in *L. elegans*, with seven sub-clavate or sub-cylindrical pseudobulbs, 7—9 inches long, and diphylous. Leaves oval-oblong, spreading, 5—6 inches long. The flowers measure 8½ inches across,

the sepals are acute, the petals twice as broad, and more obtuse; all of a delicate rosy-lilac. The lip is very strongly three-lobed, and has much of the appearance of the mother plant; the side lobes very large, and the front one constricted at the base into a very short and broad claw, broadly rounded in front, and very much crisped. In colour this front lobe is bright amethyst-purple, while the side-lobes are nearly white; the exceptions being a little rosy-lilac at their apex, and more faintly along the margin behind; a little rosy-purple running down the centre of the lip, principally along the minute keels; and the radiating veins of a very pale yellow. The column is much like that of *C. Loddigesii* in shape, white, with a little rose down the face. Four of the pollen-masses are excessively rudimentary; doubtless due to the fact that it has three-fourths *Cattleya* blood in it. Except the front lobe of the lip the flower is very delicately coloured. *R. A. Rolfe.*

### CYCNOCHES VERSICOLOR, n. *sp.\**

Something very like this was known to me nearly thirty years ago from a sketch. Much later came a description of a similar plant. Finally Sir Trevor Lawrence, Bart., M.P., P.R.H.S., surprised me in the most agreeable manner by sending me a seven-flowered inflorescence, whose comparatively short green rachis affords a fine contrast to the yellowish bracts. The pedicels are erect, the ovaries bent in a retrose way. The sepals and petals are ligulate acute, petals a little broader. The colour is exceedingly interesting; it begins of a fine dark garlic-green, with darker veins, and a certain texture of velvet; finally, the whole is of a deep brown. The lip is quite characteristic; it is oblong acute, having an excavation between the middle and the base, and on each side is an erect introrse tooth. The inner surface of the lip is convex, the outside surface is quite flat; the colour is whitish, ultimately yellowish, with a few purple spots on the anterior half inside. The substance is very thick, and reminds me of ivory. The thin curved column is clavate at the apex, with three teeth at the apex behind. It is green, with some small black spots at the base. Sir Trevor received it from Brazil. The flowers are nearly equal to those of *Cynoches Egertonianum*, but are in a stiff upright raceme.

A *Cynoches* Haagi has been described by Barbosa Rodriguez (*Genera et Species Orchidearum Novarum*, 1882, p. 221). It is said to have a labellum obovatum acuminatum ventricosum. The sepals and petals are said to be spotted at the upper margin and the apex of the green column is stated to be white. Those are very considerable differences provided the terms are correctly used.

My first acquaintance with a species of this affinity was made by copying a sketch of Wallis', representing such a plant and with more than usual care Wallis noted what follows: "Very fine epiphyte; lip exceedingly thick, like china, with red spots and two processes. Sepals and petals reddish-green, shining like velvet. Column very thin, green, with small black spots. Not much smell. Bulbs and leaves of *Cataseum*."

Wallis represented a cross section of the lip, which shows a longitudinal keel on the mid-line underneath, and the two teeth on the inner surface are median. There is no indication of a groove between the teeth and the blade of the lip is almost circular and apiculate (not acute). There may thus be three nearly allied species. *H. G. Rehb. f.*

**COLONIAL TOBACCO.**—The London Chamber of Commerce, Brompton House, Eastcheap, E.C., offers a prize for the best specimen of colonial grown Tobacco, of not less than 400 lb.

\* *Cynoches versicolor*, n. *sp.*—Racemo paucifloro stricto; bracteis pediculis longe non aequantibus flavis; pediculis cum ovario gemmifex; sepalis tepalisque cuneato-ligulatis acutis; labello oboraceo oblongo acuto, extus planissimo, intra convexo cum callis dentiformibus connatis geminis, supra excavationem antebasilarem; columna gracillima et apicem versus amplata, apice postice tridentata. 6x Brasilia imp. ill. Eques Trevor Lawrence. *H. G. Rehb. f.*

# NURSERY NOTES.

## ST. OSYTH PRIORY.

VISITORS to Clacton-on-Sea (which is a rapidly "improving" and even now a very popular seaside resort), who are admirers of beautiful flowers, and interested in objects of historic antiquity, should not fail to visit the village of St. Osyth, with its ancient Priory, and the seed grounds of Messrs. Carter & Co., the well-known seed merchants of High Holborn. St. Osyth lies some four or five

miles north-west from Clacton-on-Sea, and about the latter a few words may here be said. It is some seventy miles from London, and has, as it were, sprung into healthy existence as a watering place within the last fourteen or fifteen years. It is considered an exceedingly salubrious locality, on account of its invigorating breezes, pure air, combined with the advantages of an abundant supply of excellent water, a moderate rainfall, and its (so said) comparative immunity from violent atmospheric disturbances.

The town appears to be very judiciously laid out, with a southern aspect, and stands upon cliffs some 40 or 50 feet above the level of the sea, and com-

mands a fine view of the German Ocean. It has a very extended and fine sloping beach, with an excellent pier nearly 1300 feet long. The houses are of superior character, and the streets, as well as the footpaths, are wide, the latter being mostly formed of cement. The streets are all planted with trees, as are also numerous avenues, which are expected to ere long form part of the town. The trees consist mostly of the Elm, the Lime, and species of the Poplar, and, notwithstanding the proximity of many of them to the sea, they all appear to be doing succeeding well, although several other species have, we believe, been tried, but which were not found to do so well.

is fixed a strong stake, which stands some 5 or 6 feet high, secured at the top and in the middle by a light wooden frame, of similar dimensions to the space on which the tree stands; by means of soft string the stems are secured to these stakes, in such a way as to prevent them from chafing upon the stakes, while a broad splint is perpendicularly fixed between each stake, and this effectually preserves the stems of the trees from external injury. Altogether, this appears to be a very cheap, and certainly a most effectual tree protector.

The seed-grounds of Messrs. Carter & Co. are some 100 acres or more in extent, and lie on each

FIG. 82.—EUCALYPTUS VIMINALIS: FLOWERS WHITE. (SEE P. 596.)

The Elm appears to be the tree most extensively used, and very close to the sea are several stunted specimens of some variety of this tree, having very small leaves, which at a distance have more the aspect of Scotch Firs than deciduous trees; these have evidently been hedgerow trees a few years ago. A line of Fig trees is also growing vigorously in front of the "Royal" Hotel, which is close to the sea, but they are bearing no fruit this season. The street trees are all planted on the margins of the footpaths, which are about 25 feet wide, and are thus placed at a proper distance from the buildings. Each tree stands in the centre of a small triangular space some 18 inches in the side, and in each angle thus formed

side of the public road, just before entering the village of St. Osyth, and are entirely devoted to the production of flower-seeds, and of choice culinary vegetables. The land is light but rich, and doubtless well adapted to this purpose; and notwithstanding the cold and sunless character of the present season, which can hardly be considered to have been favourable for the purpose of seed growing, few if any of the crops at the time of our visit (early in August) appeared to have suffered from the unfavourable weather.

Those of your readers who may have seen and admired beds or isolated plants of some of our finest annual flowers, may imagine the effect pro-

duced by something like a quarter or even half an acre of such varieties as some of our finest Delphiniums, Godetia, Phlox Drummondii, &c. Conspicuous among many fine things we were struck by a very splendid variety of Godetia named the Lady Satin Rose, not yet sent out, as well as a beautiful variety of the same species named Princess of Wales, and several others. There was also a great breadth of the pretty Rhodanthé Manglesii, and a new variety of the same named Purple Queen. Mimulus grandiflorus and Mimulus Brilliant, several very fine varieties of Nasturtium, including Cloth of Gold, with very pretty flowers and still prettier golden foliage; together with Helichrysum Fire Ball, Eschscholtzia Mandarin, Antirrhinum Ruby Gem, not yet out; Mimulus Brilliant, Viola lutea, and several fine bedding Pansies, including Carter's fancy striped, Lord Beaconsfield, and a very fine pure white variety. There were also immense breadths of the finest varieties of Mignonette; and the newest and best sort of Sweet Peas. These, with many other varieties of the latest introduced, and best annual and other flowering plants, too numerous to mention, are cultivated here with the greatest care, and also subjected to a vigilant system of "roguing"—a term well understood in the trade, and which means the prompt removal and destruction of all plants which may happen to show symptoms of inferiority, or deviation from the true type, in form, colour, or habit of growth.

Nearly all, however, at the time of our visit, were aglow with bright and beautiful colours, and many of them diffusing the most delicious perfume, rendering this approach to the ancient village of St. Oysth so pleasant that the traveller may well be excused if he lingers in passing through the same. To the kindness of Mr. Gardener, who has for some twenty or more years been the successful manager of this extensive and interesting seed farm, we were indebted for what our time permitted us to see of the same.

#### THE VILLAGE AND MANOR HOUSE.

St. Oysth is a somewhat large and very ancient village. Its Saxon name appears to have been "Chick," and it derives its present name of St. Oysth from the Lady Oysth, who was the daughter of Frithwald, the first Christian king of East Anglia, and of his wife Walburga, who was daughter to Penda, king of Mercia. She is said to have founded a church and a nunnery here, the latter being supposed to have been one of the earliest monastic establishments in England. She was murdered, and her nunnery plundered and destroyed by the Danes, about the year 653, in one of their not infrequent incursions on the east coast.

The church of St. Oysth stands in the village, and is a very ancient structure, and it is also said to be one of the largest in the county of Essex, originally built of rubble and flint, in the same style as the external walls of the ancient Priory, from which it is only a short distance. The tower of the church is a very massive structure, and the interior arrangement consists of a nave and two aisles, with a very lofty timbered roof, while, in the centre of the chancel is a singular inclosure of an oval or horseshoe form; this is known as the fold, into which communicants enter and kneel. It is said there is only one other church in England in which this is to be found. The church also contains many sculptured monuments to the memory of former owners of the manor and Priory, &c.; and conspicuous on the north wall is one to the memory of the founder of Charing Cross Hospital, while a window on this wall also presents a figure of St. Oysth, and another on the south wall represents her martyrdom.

The Priory and its manor appears to have had many owners. King Canute granted it to the great Earl Godwin, who, it appears, gave it to Christ's Church at Canterbury, and soon after the Norman Conquest it became the property of the Bishops of London, one of whom founded the monastery. After the dissolution Henry VIII. granted it to his favourite, Thomas, Lord Cromwell, and after his

execution it again reverted to the crown. It subsequently came into the family of Darcy, and Lord Darcy was created Earl Rivers in the year 1641.

It afterwards passed by marriage to the third Earl of Rochford, who built the principal part of the present mansion. In 1857 the Priory and estate became the property of the present owner, Sir John Henry Johnson, who has made considerable alterations and greatly improved the property.

The gardens, pleasure grounds and glass structures now cover some 9 acres of land, and everything is kept in excellent order. The mansion is in the form of a vast quadrangle, and being built at sundry periods is of various styles of architecture. The noble gatehouse or entrance to the grounds is a very handsome structure in the late Norman style. It is built of flint and hewn stone, covered with beautiful tracery. On the right are the extensive ruins of the ancient monastery, the chapel of which has been restored, and is unique in character and in good preservation, as is also a lofty tower from which charming views are to be obtained of the surrounding country, including the estuary of the Colne and Blackwater, the German Ocean and the island of Mersea.

The gateway alluded to faces the south, and towards the east, in the ancient wall, may be observed what must have been the principal entrance to the monastery, but which is now built up. The glass structures consist of a central conservatory, from which extend to the right and left houses for the cultivation of Grapes, Peaches, and other exotic fruits. The conservatory contains some fine specimens of old-fashioned plants in good condition. On a wall near to this, some 30 or more feet high are trained some very fine climbing plants, including a magnificent specimen of the Wistaria sinensis, which, in addition to clothing a large portion of this lofty wall, extends itself at a right angle from the same, so as to form a canopy or covering for a broad walk, and must, when in full flower (which was lately the case) have been an object of great beauty. Another portion of this high wall is covered to the top with healthy Fig trees bearing abundance of fruit, with, notwithstanding the unfavourable season, had every appearance of ripening soon. The grounds also contain many examples of beautiful trees, such as a gigantic Tulip tree (Liriodendron tulipifera), supposed to have been planted more than a hundred years, and blooming profusely; also a very fine example of the Cedrus Deodara, which was planted in 1861. On the west side of the mansion is a fine geometric flower garden, the beds of which are well filled with the most choice varieties of bedding plants, adjoining which is a fine lawn or tennis ground. This very beautiful and interesting garden establishment has for many years been under the care and management of Mr. Howard, and the excellent condition in which all is kept does him credit, while his intelligence and civility leave a very favourable impression upon all who may visit St. Oysth Priory. P. G.

### THE DOUGLAS FIR IN SCOTLAND.

(Concluded from page 569.)

ASSUMING, then, that the average tree in the Taymouth plantation will show a future development similar to that shown on the above mentioned cross-section, I have endeavoured to forecast the volume of solid wood, or growing stocks (3 inches and upwards in diameter), which an acre of land belonging to the first quality is likely to contain at various periods.

In order to facilitate my task I shall commence by giving such data for the Silver Fir, obtained by careful and extensive measurements on the Continent. The volume, or cubic contents of a standing tree, is best calculated by the following formula:

$$s \times h \times f.$$

Here  $s$  represents the sectional area taken at a convenient height above the ground, usually the height of the chest of a man, or about 4½ feet;  $h$  indicates the height or length of bole; and  $f$  indicates a

certain coefficient called "the form figure." The product of  $s \times h$  represents a cylinder with a base equal to that of the tree at 4 feet 6 inches from the ground, and a length equal to the height of the tree, the volume of which is considerably larger than that of the tree, as the latter tapers from the base upwards; hence  $f$  is a fraction of 1, and as the product,  $s \times h$ , is thus reduced by multiplying it with  $f$ , the latter is sometimes called the reducing factor.

During late years a large number of Silver Fir woods, of varying age, from early youth up to maturity, have been carefully measured, arranged in different qualities—best, middling, and inferior—by ascertaining their height, sectional area at height of chest, and their cubic contents; by dividing with the product of height by sectional area ( $h \times s$ ) into the volume, the form figure has been ascertained. The tables thus constructed can now be applied to the measurement of standing woods without any fellings whatever, by merely measuring the height and sectional area, and by taking the form figures from the tables.

The following extract shows the mean volume of solid wood in a well-stocked Silver Fir wood growing in a locality classed as belonging to the first quality up to an age of 140 years, beyond which age no figures are available:—

Age, yrs.	No. of trees per acre.	Mean ht. feet.	Sectional area at height of chest, for square feet per acre.	Form figure.	Volume of solid wood (3 inches diam. and upwards) cubic feet.	Mean Tree. Sectional area, square feet.	Diam. in.
33	1745	17	93	.65	1,032	.053	3.1
50	931	42	177	.47	3,458	.190	5.9
75	433	75	243	.47	8,532	.561	10.1
100	213	97	295	.46	13,291	1.385	15.9
125	126	109	335	.45	16,391	2.659	23.1
140	101	114	353	.44	17,720	3.495	25.3

In order to prepare a similar table for Douglas Fir, it is necessary to ascertain the total sectional area per acre, the mean height, and the form figures for the years 50, 75, 100, 125, and 140 years; and this, with the scanty material at present available, can only be done in a rough and preliminary manner.

**Sectional Area.**—We know that the sectional area of a dominant (or leading) tree is as follows:—

At the age of 50 years ...	=	1.115 square feet.
" 75 " ...	=	1.847 "
" 100 " ...	=	2.885 "
" 125 " ...	=	3.715 "
" 140 " ...	=	4.307 "

In order to ascertain the total sectional area per acre at these periods, we must ascertain the number of trees which a well stocked acre is likely to contain at the same periods. We know (1) that a well-stocked acre contains 202 Douglas Firs at the age of thirty-two years; (2) that 101 Silver Fir 140 years old, of a mean sectional area of 3.495 square feet, find room on an acre; (3) that generally a Douglas Fir requires at least as much room as a Silver Fir of the same sectional area, and, in fact, somewhat more, owing to the somewhat more spreading nature of the branches; and (4), that a Douglas Fir 140 years old shows a sectional area of 4.307 square feet.

Taking these facts into consideration, the following numbers of Douglas Firs per acre have been estimated:—

At the age of 33 years ...	202
" 50 " ...	150
" 75 " ...	125
" 100 " ...	100
" 125 " ...	88
" 140 " ...	80

By multiplying these numbers with the mean sectional area per tree, the total sectional areas of all trees per acre are obtained.

(b) **Height.**—The following facts are at our disposal:—(1). A Douglas Fir thirty-two years old has a mean height of 60 feet; mean annual height growth = 22½ inches; (2), a Douglas Fir fifty-seven years

old has a mean height of 90 feet; mean annual height growth (from thirty-second to fifty-seventh year) = 14 inches; both grown in Perthshire. (3). Mature Douglas Firs in the most favourable localities of North America are reported to reach a mean height of 215 feet; such trees are often up to 500 years old, but it is not known, at what age the height growth ceases: let us assume that it is very slight after the age of 250 years. With these facts before us, the heights up to an age of 140 years may be estimated as follows:—

At the age of 32 years	...	...	...	63
" 50 "	...	...	...	82
" 75 "	...	...	...	105
" 100 "	...	...	...	125
" 125 "	...	...	...	141
" 140 "	...	...	...	150

(c.) *Form Figure.*—The form figures for Silver Fir are:—

At the age of 32 years	...	...	...	65
" 50 "	...	...	...	47
" 75 "	...	...	...	47
" 100 "	...	...	...	45
" 125 "	...	...	...	45
" 140 "	...	...	...	44

The form figure of the Taymount plantation shows '39 for an age of thirty-two years. This is very considerably below the form-figure for Silver Fir, and it is in accordance with the facts of the case. The Douglas Fir is a much more tapering tree than the Silver Fir, and the highest form figures which can be expected may perhaps be placed as follows:—

At the age of 32 years	...	...	...	39
" 50 "	...	...	...	38
" 75 "	...	...	...	38
" 100 "	...	...	...	36
" 125 "	...	...	...	36
" 140 "	...	...	...	35

By utilising the figures thus estimated the following table for the Douglas Fir has been calculated:—

Age, yrs.	No. of trees per acre.	Mean height in feet.	Sectional area at height of chest, in square feet, per acre.	Form figure for solid wood.	Volume of solid wood (3 inches diam. and upwards), cubic feet, per acre.	Mean Tree. Sectional area, square feet.	Diam. in.
32	202	60	155	33	3,738	782	12.0
50	150	82	167	38	5,204	1,115	14.3
75	125	105	231	38	9,217	1,847	18.4
100	100	125	288	37	13,322	2,885	23.0
125	88	141	3.7	36	16,599	3,715	26.1
140	80	150	345	35	18,112	4,307	28.1

Let us now compare the volume of the Douglas Fir with that of the Silver Fir:—

Age.	Growing stock, per acre in cubic feet.	Mean annual increment in cubic feet per acre.	Douglas Fir.	Silver Fir.	Douglas Fir.	Silver Fir.
50	5,204	3,458	104	69		
75	9,217	8,532	123	114		
100	13,322	13,291	133	133		
125	16,599	16,291	133	130		
140	18,112	17,720	129	127		

This table indicates that under a rotation of up to about ninety years the Douglas Fir, owing to its more rapid development in early growth, yields larger returns of solid wood than the Silver Fir. Under a rotation of 90 to 120 years the returns in volume are about equal. Under a rotation of more than 120 years the Douglas Fir will again yield larger returns of volume than the Silver Fir. The latter is of little consequence in this country, because no landed proprietor would think of working his plantations under a rotation of more than 120 years, unless he had a particular fancy to see large trees on his estate. Attention must also be drawn to the fact that the mean annual increment culminates between the years 100 and 125, so that a rotation of,

say, 110 to 120 years will yield, in the long run, a larger number of cubic feet of solid wood, than either a shorter or longer rotation, both in the case of Silver Fir and, as far I can judge, also of Douglas Fir.

The above data, it must always be remembered, refer only to the final cuttings. I have no data whatever which would enable me to compare the intermediate returns (thinnings) of Douglas Fir and Silver Fir. I may also draw attention to the fact, that the numbers of cubic feet given above refer to the actual volume of solid wood. In order to obtain the number of cubic feet calculated from the quarter girth, as is usual in this country, the numbers must throughout be reduced by about one-fourth (more accurately 22 per cent.).

I have compared the returns of the Douglas Fir with those of the Silver Fir, because we possess accurate tables giving the volume-yield of the latter at different ages. It would have been more to the purpose to substitute the Larch for the Silver Fir, but unfortunately the laws of increment of the former have not as yet been so minutely studied and recorded as in the case of the latter. So much, however, is known, that the Larch develops much more rapidly than the Silver Fir during youth, and that it yields larger returns of solid wood under a rotation of seventy-five years, and perhaps even eighty years, in favourable localities; under a higher rotation the volume yield of the Silver Fir is greater than that of Larch. Hence it may be safely said that under a rotation of seventy-five and perhaps even eighty years the Larch will yield as much solid wood as the Douglas Fir whenever they are grown in regular fully stocked woods, and in localities of equal quality—with this difference, that the material yielded by the Douglas Fir will consist of a smaller number of trees per acre, with a greater mean diameter per tree.

The laws of increment of Scotch Pine are well known. On good localities, like that of Taymount, the growing stock of a fully stocked acre compares as follows with that of Douglas Fir:—

Age.	Volume of solid Wood per acre, in cubic feet.	Mean annual increment per acre, in cubic feet.	Douglas Fir.	Scotch Pine.	Douglas Fir.	Scotch Pine.
50	5,204	5,690	104	112		
75	9,217	7,900	123	105		
100	13,322	9,300	133	93		

Under a rotation of fifty years Scotch Pine may even yield a little more material than the Douglas Fir, but later on it drops considerably behind.

*Quality of the Timber.*—The next point of importance is the quality of the timber. The wood of the Douglas Fir has a great reputation, and in America its quality is believed to be equal to that of Larch timber. In how far the Douglas Fir grown in this country will come up to that standard remains to be seen. The larger sized trees so far cut on the Scone estate have been freely bought at the same rates as those usually paid for Larch, but sufficient time has not elapsed to show the comparative merits of home grown Douglas Fir and Larch timber.

A few words must now be added with regard to the *safety of production*. First of all it is an undisputed fact that Douglas Fir can, in this country, only be successfully grown in sheltered localities, because its leading shoot, and even the lateral branches, are very liable to be broken by wind. This reduces the area suitable for its cultivation very considerably.

Then there can be no doubt that the Douglas Fir, in order to yield large volume returns, requires good fertile and fresh or moist soil, in fact, soil on which any other species will produce a large volume of timber. Such land can, moreover, be used to greater advantage for field crops. What we specially require are species which will do well, or at any rate fairly well, on lands which are not suitable for field crops.

Finally, it has been said that the Douglas Fir is not exposed to any *disease*, while the Larch, for instance, suffers so much in this respect. With regard to this point, it will be as well not to shout until we are safely out of the wood. It will be remembered that the Larch disease did not show itself in Scotland until about sixty years ago. Only quite lately Mr. McGregor, who has been on His Grace the Duke of Athol's estates for more than forty years, pointed out to me, that he has never seen the Larch cancer on any of the old Larch trees, except on those parts of the trees which have been formed during the last sixty years. This certainly seems to indicate that the disease did not exist before about the year 1820.

No doubt exists now that the Larch cancer is the result of the ravages of a fungus (*Peziza Wilkommii*), the spores of which enter the tree through wounds which were caused by insects (aphis), frosts, violence, &c. Only a few days ago, and after I had commenced this article on the Douglas Fir in Scotland, I saw in a German forest journal a notice of the discovery of an injurious fungus on the Douglas Fir. Dr. von Tubeuf, a pupil of the celebrated pathologist, Dr. R. Hartig, of Munich, has now described a fungus, *Botrytis Douglasii*, which is parasitic on the Douglas Fir: it has been noticed during the last ten years in several widely separated localities in Germany on the trees in the experimental plantations which have been made of late years. As far as is known at present the fungus attacks in the first place the young shoots, the needles of which turn brown or gray, the whole being ultimately spun over with mycelium; it then extends and kills ultimately the plants. It has also been found that this same fungus can be cultivated on two to six year old plants of Silver Fir, Spruce, and Larch. Dr. von Tubeuf found, as a general rule, that those Douglas Firs were specially attacked which grow in fully stocked areas, so that the branches of the trees interlaced; and in these cases the lower branches were more attacked than those higher up. He also noticed that free standing trees were free of the disease, and he naturally draws the conclusion, that infection depends on a high degree of moisture, such as is found in dense woods, while free-growing trees, exposed on all sides to drying air currents escaped. Now, what does this mean? Simply that the Douglas Fir must be grown in thin open woods, and if so, good-bye to any high returns per acre, such as Silver Fir, Larch, or even Scotch Pine will yield.

Generally Dr. von Tubeuf adds some very sensible remarks, of which I give the following extracts. He says:—

"In introducing an exotic species, the first question should be whether, if grown in the same locality, it possesses any real advantages over our indigenous species, either in consequence of a superior quality of wood, rapid growth, large dimensions, active reproductive power, &c., or by more successfully resisting any unfavourable conditions of the soil or climate, or by being less subject to natural enemies, such as game, animal or vegetable parasites, &c. A further most important question is, whether with the exotic tree we are likely to introduce new enemies to our indigenous trees; and in this respect we need only remind the reader of the imported enemies of the Potato, the Colorado beetle, the enemies of the Vine, &c. . . . .

"Of our own enemies of trees, a large number attack without distinction the exotics lately introduced, Curculio, Bostrychus, cockchafer, caterpillars and beetles attack exotics like indigenous trees; *Trametes radiciperda* (one of the most formidable of fungi) destroys the wood of the Douglas Fir like that of any other species."

These words deserve serious consideration. It is more than probable that the Douglas Fir will, with us, in the course of time, develop its full share of enemies, if not more, considering that it is an exotic species.

Before concluding I desire to express a hope that my object in publishing these notes on the Douglas Fir may not be misunderstood. The cultivation of

the tree in Great Britain and Ireland looks at present very encouraging, and I trust that experiments will be continued; but I deprecate altogether rushing into extensive plantings, as advocated by the correspondent of the *Perthshire Constitution*, until time has shown that the tree really deserves to supersede the species hitherto cultivated by us, and of which we know what to expect. My personal opinion is that the Douglas Fir will just as little revolutionise our sylvicultural operations as the Weymouth Pine has been able to do, though great things were expected of it at one time. There is a great difference between nursing up a single tree in a fine soil and under otherwise favourable conditions, and the growing of a species on a large scale for economic purposes; in the former case only exceptional results present themselves to the eye, while in the latter case averages must be looked for and reckoned with. *W. Schlich, Cooper's Hill, October, 1888.*

## ORCHID NOTES AND GLEANINGS.

### HYBRID ORCHIDS AT THE DELL, EGHAM.

It is at such a time as the present, when there is a hiatus in the supply of Orchid flowers, that the value of some of the hybrids of Messrs. J. Veitch & Sons (so far as the showier genera are concerned) is apparent. Viewing the collection belonging to Baron Schroder this week, the houses gay with beautiful flowers, supplied for the greater part by the hybrids, the thought involuntarily arose—What a difference it would make if all these home-raised garden plants were non-existent. The blooming period of the great section of Cattleya and Lælia is over until the flowers on the specimens of Cattleya Trianae expand; the grand masses of coloured and white L. anceps (among which are several L. a. Dawsoni with six to seven spikes each), producing their wealth of bloom, and the other late winter-flowering things appear, yet here was a fine display of bloom which, although varied, had been running concurrently with the show of imported species, and now remained to carry on until others came. Viewing these hybrids in flower, one is struck with their peculiarly intense brilliancy and richness of colour, which in most cases has surpassed that of the parents. The favourite genus, *Cypripedium*, now so rich in hybrids, gives a great variety of handsome things, whose individual beauties increase in proportion as the plants gain in strength.

At present at The Dell a good opportunity occurs to see together a good plant of the rare *C. Fairrieanum* which has had five flowers, and beside it a large specimen of *C. Arthurianum* ×, a variety the produce of the first-named and *C. insignis*; and also *C. vexillarium* ×, the result of the same crossed with *C. barbatum*. All three have lovely flowers, the hybrids having the charming curves of outline of *C. Fairrieanum*. *C. onanthum superbum* ×, too, stands out as a leading variety; and *C. Harrisianum superbum* × is the finest of the section. Many hybrids of *C. Sedeni* × are in bloom, as well as other fine species and hybrids, of which *C. Charles Canham* ×, if not showy, is at least a massive and distinct flower.

Of hybrid Cattleyas and Lælias, *C. Victoria*, which is here in flower, is a fine thing, resembling *C. exoniensis* ×, but with a greater lip expansion; Cattleya Dominiana ×, a cross between *C. maxima* and *C. intermedia*, was bearing handsome flowers, resembling the charming *C. Harrisii*, a species which has also bloomed at The Dell, and which has *C. Mendelii* for one of its parents. The latter was raised by the late Dr. Harris, of Lamberhurst, whose hybrids have passed into the hands of Messrs. J. Veitch & Sons, and who also raised *C. Lamberhurst* hybrid = *C. citrina* × *C. intermedia*, both of which, shown by Baron Schroder, were certificated at the Royal Horticultural Society's meeting, October 23 last. Cattleya Novelty ×, an exquisitely coloured flower, and the beautiful *L. dominiana* ×, *C. porphyroblebia*,

and others were just out of bloom, while well-advanced in bud were large plants of *L. Bella* ×, *L. Veitchiana* ×, *L. Canhamiana* ×, *L. lilacina* ×, *C. Mastersoniae* ×, *C. fausta*, *C. Bella*, and others. The handsome little *Sophro-Cattleya Batemanni* has flowered here several times, but the still more interesting *Veitchian* cross between *Sophronites grandiflora* and *Cattleya Trianae* has unfortunately dropped its buds.

The *Calanthes* now make a fine show, but the bright magenta *C. Veitchii superba* holds its own among them all, and makes the best show by reason of its being grown in quantity. Other hybrids were remarked, the best white being *C. Hallii* ×, which, as seen here, is purer in colour than either *C. Cooksonii* or *C. Barkerii*, which were placed beside it. *C. Alexandræ* ×, *C. lentiginosa* ×, and *C. Sandhurstiana* × are finely-coloured varieties and the beautiful hybrid cross between *Calanthe* and *Phaius*—*Phaio-Calanthe Sedeni*—bore a stout spike of its beautiful creamy-white and pink flowers.

Among the hybrid *Dendrobies* rendered so popular by the *D. heterocarpum* hybrids, of which *D. splendissimum grandiflorum* × is the best, the perennial flowering *D. rhodostoma*, with its rich claret-crimson-tipped petals, is profusely in flower; *Dendrobium Phalenopsis superba*, too, is in flower, and is worth a journey to see.

In flower were *Epidendrum Wallisii*, a fine variety; an autumn-flowering *C. labiata*, which for richness of colour in the labellum far excels the original variety; *Cypripedium Argus nigro-maculata*, the best variety of that species; and the very rare *Odontoglossum Warszewiczii*, a plant with eight spikes in bud. Considering the varied collection, and the large number of varieties difficult to grow, Mr. H. Ballantine keeps The Dell collection up to the best possible mark of excellence, and its generous owner gets the gratification from his plants which he so well deserves. *J. O'B.*

### PHAIUS CALLOSUS.

Besides *P. grandifolius*, which is one of the best known *Phaius*, and *P. Wallichii*, a very meritorious species, there are several other species of *Phaius* fully deserving of attention, but which are rarely met with. One of them is *P. bicolor*, which was noted in these columns a few weeks ago, and another is the subject of this note. *P. callosus* has long been known to botanists, and reference is made to it in the volume of the *Gardeners' Chronicle*, for 1848. A plant of it which was imported from Java last year is now flowering at Kew. The flowers measure 3 inches across, and on the plant under notice are borne on a stout radical scape 18 inches high, which carries eight flowers; fully established plants, however, would probably produce double or treble that number. The sepals and petals are broadly lanceolate, and of a dull reddish-brown, the tips being whitish; the lip is tubular, the front portion not being so spreading as in *P. grandifolius*; it is of a yellowish-white, tinged with pink, and is slightly pubescent.

By growing the four species I have mentioned above, all of which require the same general treatment, a succession of flowers could be kept up for probably ten months in the year, and this, with plants of the stately and effective appearance of *P. grandifolius* would be of no small advantage for conservatory decoration. *W. B.*

### CÆLOGYNE OCELLATA.

An exceedingly pretty species with flowers much resembling those of *C. corymbosa*; in the latter, however, the flower-scapes are produced along with the young growth, whereas in *C. ocellata* they rise from the apices of the developed pseudobulbs. The species is figured in the *Botanical Magazine* (t. 3769), but the figure does not convey a just idea of its characteristics. The flowers are 2½ inches in diameter, and three or four occur on a raceme. The sepals and petals are of pure white; the lip, the side lobes of which enclose the column, has also a white ground, but is marked on the middle lobe with two round, eye-like yellow spots; each side lobe being

also marked with a blotch of yellow and striped with reddish-brown. It is stated in the *Orchid Grower's Manual* to flower in February and March, but several plants are now in flower at Kew. It may be grown in pots of fibrous peat and sphagnum, but it succeeds equally well when grown on rafts and suspended from the roof, in which case peat fibre should be fastened about the roots and sphagnum placed on the surface. Being from Northern India it requires cool, moist conditions. It was introduced in 1822. *W. B.*

### TRICHOPILOA TORTILIS.

Basket or pot culture suits these plants well, but if well elevated above the pot's rim they perhaps flower most abundantly in this manner. In potting, above all, provide good drainage, and for soil use good fibrous peat, through which may be worked some moderately-sized nodules of charcoal, which will allow the roots to penetrate it better, and at the same time assist in carrying away the water more quickly. The species is a free-growing plant, which requires a medium supply of water to its roots during the season of growth, but it enjoys an atmosphere well charged with moisture; and although the water supply to the roots must be considerably reduced through the winter months, it must never be entirely withheld, as the slightest amount of shrivelling is injurious. This plant should be grown at the cool end of the Cattleya-house, well exposed to the sun and light, but should have the sun screened from it during the hotter part of the day, in order to preserve the colour of its foliage, which forms such an admirable background for its blossoms. It is not very liable to the attacks of insects, but scale, and even thrips, will sometimes affect it, more especially if the plant is in a slightly bad state of health; but watchful care on the part of the cultivator will prevent these pests from gaining a lodgment. The plants may be increased, if necessary, by division; but it is far better to have one fine plant than several small ones. The division should be made just as the new growths appear, and several old bulbs should be left at the back of the leading growth. The divisions may be potted, and treated in exactly the same manner as the established plants. "*Orchid Album*," October.

### CYPRIPEDIUM FITCHIANUM

is a distinct and pretty variety, and compact in its habit. The leaves are oblong acute, from 4—6 inches in length by about 1½ inch in breadth, and prettily variegated; the ground colour is greyish-green, marbled and spotted with deep olive-green. The scape rises well above the foliage, and bears a single large and handsome flower. Dorsal petal somewhat ovate cuneate, white, conspicuously veined with bright green, the lower sepal being similar in colour, but smaller; petals long and strap-shaped, with blunt ends, green towards the base, the apical portion and the margins being suffused with deep red, and bearing a few black hairy warts on the edge; lip large, dull red, veined in front with green, the inner surface profusely spotted with dots and spots of red. It blooms in the winter months, and continues in perfection for fully six weeks. "*Orchid Album*," October.

## THE RELATION BETWEEN BLOSSOMING AND THE DEVELOPMENT OF TUBERS IN THE POTATO.\*

In the climate of Germany the blooming of different varieties of Potatoes is very much restricted. Most of the varieties do not flower, excepting here and there in the course of years; a small number only flower regularly and bear fruit. It is not so in Chili, the habitat of the Potato. There it flowers abundantly, but the tubers remain small, while in the temperate zone the formation of the tubers is favoured at the expense of fertilisation.

\* By E. Wollny, *Försch. auf d. Geb. der Agrarphysik*, x., pp. 214—218.

This fact seems to indicate a sort of balance between the two modes of reproduction by the tubers, and by the seeds: the energy of the one seems to bring about the decadence of the other. In fact, Knight and Langenthal have found that they may increase the blooming by detaching the young tubers as they appear. Inversely, they found that suppressing the flowers favoured the development of the tubers of many varieties. An anonymous English

the number as well as size of the tubers. However, the early varieties, and the plants which had not been topped till late, gave a contrary result, one crop being poor, probably because there remained some little time between the operation and the maturity of the tubers, and the season had been especially dry from July 14 to August 25.

These experiments enable us to understand why the Potato does not thrive alike in Chili and Ger-

behind a screen of a "solution" of sulphate of quinine. But it seems to us that it is necessary to divide the problem into two, and to distinguish one immediate influence and another indirect influence, the effect of which is itself accumulated by heredity, in order to become a race-characteristic. These two features necessarily combine, and act in the same way in our country. We do not think, however, that these things are brought about by purely physical influence.

There are, in fact, many examples of plants being reproduced artificially or naturally by budding, root grafting, tubers, &c., and which in flowering do not produce fruit, or which, producing fruits, are none the less sterile, as seeds are not formed in them. *Lysimachia nummularia*, a creeping plant; the Tarragor, which flowers but does not set seed; Garlic rocambole, which produces bulbs in place of flowers; a variety of *Ficaria ranunculoides*, which produces tubercles in the axils of the leaves; and Sugar-cane and Bananas which are nearly always sterile. *Abstract in Annales Agronomiques*, xiv., pp. 383-4.

## CALANDRINIA OPPOSITIFOLIA,

S. WATSON, *sp. nov.*

THE contrast between the rich deep maroon of the so-called *C. umbellata* and the pure white or rose-blush of the present species is striking in the extreme, and as we have no reason to doubt its comparative hardiness, it will, no doubt, prove a great acquisition to the outdoor garden. The plant from which the sketch (fig. 83) was made was grown through the winter in an unheated house, and, in consequence, may be a little drawn, although the description from wild plants gives the scape as 3-10 inches high. The tuberous root is very thick and fleshy, the lower leaves oblanceolate, narrowed to the scaly margined underground base; from 2-3 inches long, thick, succulent. The flower-stem is branching, with one terminal three-flowered umbel; the pedicels 1 or 2 inches long, sepals round, short, acutely dentate; flowers over 1 inch in diameter, pure white, in some blush-rose, the latter especially very lovely. It was collected by Thomas Howell at Waldo, Oregon, and in the coast mountains of Del Norte County, California, near Smith River, and published in the *Proceedings of the American Academy of Arts and Sciences*, vol. xxii., p. 355, D.

## FRUIT REGISTER.

### PEARS.

It would be scarcely safe for a gardener to limit his varieties to fifteen, in view of the uncertainty of cropping in some of those named by Mr. Sheppard in these pages on November 10. I would like to add Jargonelle, a Pear which everyone likes; Eyewood, piquant in flavour, and a good grower and cropper. In both of these the spurs are naturally long, and should be shortened only when they have become unsightly. I think the Pears with long spurs and long stalks to the fruits usually have pendulous blossoms, and are thus rendered less liable to injury from snow and frost when open. Beurré Diel is an excellent hardy Pear, and Marie Louise d'Uccle is also good, and equally hardy; Monarch should not be omitted; Hacon's Incomparable also, where it does well, is welcome for its tender flesh and pleasant flavour. It usually crops well every other year; but by thinning out the fruits when too abundantly borne, this Pear, and others with the same peculiarity, may be made to crop fairly well every year when not prevented by frost from setting their blooms. Beurré d'Arreberg is another variety which bears well and pretty constantly. Well grown and ripened it is excellent, but as it is a very free setter the fruits ought to be thinned on wall trees, pyramids, &c. Nouveau Poiteau and Easter Beurré can hardly be omitted, although the period at which

FIG. 83.—CALANDRINIA OPPOSITIFOLIA; FLESH-COLOURED.

author has obtained by this method an increase in harvest of 2670 lb. per acre.

Wollny recognises that, from his experiments, the development of the flower is prejudicial to that of the tubers. Experiments were conducted in 1886 on many varieties that produce flowers. Four plots were planted with each variety, one acting as a duplicate or control, being left to itself; the inflorescence on the other three was cut at three different periods. The inflorescence oftenest cut off produced the crop of greatest weight; it also exercised an influence on

many. It is probable that dryness and sunlight induce bloom, and humidity, and a sky more or less cloudy, the formation of tubers. In fact, in dry years a great number of varieties flower, while the same varieties do not bloom when the weather is moist and the sky is obscure.

The influence of light upon the production of flowers is a fact that has been long known, and very recently Sachs has shown that it is the chemical rays which provoke flowering. Plants of *Nasturtium*, a flowering plant of the first class, produced no flowers

the latter ripens in store is very uncertain, and Nouveau Poiteau is in season with Marie Louise.

In all large establishments there are many persons about who are fond of the Pear, and it would often be the means of saving the gardener's best fruit if he were to consider this, and provide for it by planting those varieties which are free bearers, and which, if not first-rate, are of fair quality. Such are *Beurré de Capiaumont*, *Aston Town*, *Summer Franc* *Rail*, *Thompson's*, *Jersey Gratioli*, *Windsor*, *Autumn Bergamotte*, *Vigneuse*, *Louise Bonne*, *Bishop's Thumb*, *Souvenir du Congrès*, *Beurré Clairgeau*, and *Brown Beurré*. I am sorry to leave off with these varieties, many delicious Pears being even now omitted, but the lists—*Mr. Sheppard's* and this—seem to be rather too abundantly found in autumn Pears. In ordering the Pear trees from the nurseryman do not forget to add some trees—bushes rather—of various Quinces. The fruits are very generally liked as preserves and in other ways. *F. M.*

#### PEAR BEURRÉ HENRI COURCELLE.

A small Pear; a seedling from *Bergamotte Esperen*, raised by *M. Arsène Sannier*, which makes up for its small size and indifferent appearance by its exquisite flavour. Its form is like that of *Bergamotte Esperen*, but it is late, and does well on the Quince, and is very fruitful. *Bulletin d'Arboriculture*.

### PLANT NOTES.

#### IMPATIENS HAWKERI.

This is a bold free-flowering species bearing red flowers on longish stalks, which stand out well above the foliage. Perhaps this might be placed with such as *I. Hookeri*, which is a strong grower, bearing large flowers, and it is a credit to any cultivator who succeeds in flowering this plant; but the one in question has certainly the merit of being free-flowering, as plants with us have been continually blooming from the early part of the year, and promise to continue throughout the winter. Some say that it requires a large amount of pot-room, and compare it unfavourably with *I. Sultani* and *Episcopi*; but to us it seems unnecessary to make this comparison, as both kinds may be regarded as strikingly different. Those who have seen it in flower in this neighbourhood are much impressed with its large handsome flowers. Cuttings strike freely, and if these, when rooted, are potted into strong fibrous yellow loam, together with some coarse sand, and grown in a light position in a warm house, the nodes are produced closer together than would otherwise be the case if they received contrary treatment. If it could be crossed with *I. Sultani* or one of its varieties doubtless the result would prove satisfactory, but unfortunately these large flowering kinds do not, as far as our experience goes, intermingle with these smaller flowering species. There is a difference between the pollens of these two species both in colour and shape. In *I. Sultani* the pollen grains are reddish and barrel-shaped, while those of *I. Hawkeri* are round and yellowish; but whether these differences are sufficient to prevent a cross being made between the two we are unable to state.

#### SECIUM EDULE.

This is by no means a free-flowering plant in this country, that is, as far as our experience goes, and therefore it is not likely to become very popular. A specimen is now flowering profusely in one of the warm-houses of the Cambridge Botanic Gardens. It is a member of the Cucumber family, and is a much esteemed vegetable in the tropics. The fruit is about 4 inches in length, and is furnished with a number of small harmless prickles; it contains only one seed, which germinates within the fruit, and never separates from it. The shoots are long, almost of an indefinite length, one we measured

being more than 25 feet in length. The tendrils are from three to five-cleft, but are more generally produced in fours, and when out of flower it is not unlike a Cucumber plant. It has monococious flowers, of dull white colour; the male flowers are in racemes, while the others are solitary. Both male and female flowers have a number of secreting glands in the tube of the corolla, about which many small reddish-coloured ants were particularly busy. (Can you inform me the name of this ant, as it seems most common amongst stove plants, but its name is not widely known?) The fruits are sometimes imported and sold in Covent Garden under the name of *Chayotes*. It has been introduced into Madeira and other Atlantic Islands, from whence we received our seed some two years ago. The root is also spoken of as being edible, resembling a Yam both in flavour and form. Unfortunately the plant at Cambridge cannot be fruited, owing to the proposed demolition of the house in which it is planted out. *W. Harrow, Cambridge Botanic Gardens.*

### SPECIMEN TREES IN KEW GARDENS.—II.

THE STONE PINE (figs. 84 and 85, pp. 604 and 605).—One of the most characteristic trees at Kew is *Pinus pinea*. It is to be found on the lawn, to the left, not far from the entrance from Kew Green, and near the Director's office. It is not remarkable for the height of its trunk, but the head, as will be seen from our illustration, is very characteristic. The French call this Pine the *Parasol Pine*, from its umbrella-shaped head. In some places along the Riviera, and especially in Italy, the Stone Pine forms a marked feature of the landscape. *M. Joly* has lately described a specimen near *St. Tropez* which has a height of 16 metres, while the diameter of the head is 26 metres. The leaves are in pairs, each 4–5 inches long, and of a dark green colour, while the rich brown cones, of the size of a Cocoon, take three years to ripen, and are remarkable for their prominent scales, the apices of which are dome-shaped and ribbed, reminding one of the dome of the cathedral of Florence. The seeds are oblong-ovoid, and are a favourite delicacy with the Italians. The wing of the seed is relatively narrow, forming a hatched-shaped membranous process surmounting the seed. This tree is remarkable for the occasional development of shoots with long single leaves instead of the usual pair—leaves similar, in fact, to those which are produced on the young plant in succession to the cotyledons.

In this country the tree is somewhat spring-tender, on which account we rarely meet with fine specimens, but we have received cones from *Mr. Powell*, of Drinkstone Park, and others. *Messrs. Dammann*, of Portici, have also favoured us with specimens of a golden-leaved variety. The Ravenna forest, once so celebrated and rendered popularly known by *Leigh Hunt* and *Byron*, was composed of this tree. These groves of stately Pines rose terrace after terrace for mile after mile along the Adriatic shore, but were killed in the winter of 1879–80, as graphically narrated in our columns June 4, 1881, p. 736. Such a wave of intense cold had not been known along the Adriatic for centuries, and that was proved by the Pines, which had grown up with the city's growth. Our correspondents at the time speak of gaunt bare trunks, attesting the destructiveness of the frost and to the severe loss of the peasants, whose living largely depended on the collection of the seeds. It is, however, quite possible that young seedlings protected by a mulching of the fallen leaves, may have survived, and if so that they are now gradually bidding fair to replace the trees that were killed. Perhaps some correspondent may be able to say whether or no this surmise is correct. In the mean time the following extract will suffice to give an idea of the former impressions of these forests:—

"This pinetum stretches along the shore of the Adriatic for about 40 miles, forming a belt of variable

width between the great marsh and the tumbling sea. From a distance the bare stems and velvet crowns of the Pine trees stand up like Palms that cover an oasis on Arabian sands; but at a nearer view the trunks detach themselves from an inferior forest growth of Juniper, and Thorn, and Ash, and Oak, the tall roofs of the stately Firs shooting their breadth of sheltering greenery above the lower and less sturdy brushwood. It is hardly possible to imagine a more beautiful and impressive scene than that presented by these long alleys of imperial Pines. They grow so thickly one behind another that we might compare them to the pipes of a great organ, or the pillars of a Gothic church, or the basaltic columns of the Giant's Causeway. Their tops are evergreen, and laden with heavy cones, from which Ravenna draws considerable wealth. Scores of peasants are quartered on the outskirts of the forest, whose business it is to scale the Pines and rob them of their fruit at certain seasons of the year. Afterwards they dry the Fir cones in the sun until the nuts which they contain fall out. The empty husks are sold for firewood, and the kernels in their strong shells reserved for exportation. You may see the peasants—men, women, and boys—sorting them by millions—drying and sifting them on the open spaces of the wood, and packing them in sacks to send abroad through Italy."

### THE FLOWER GARDEN.

PLANTING.—Although this is generally considered one of the best months in the year for planting deciduous subjects and most evergreens, one cannot advise a continuance of that operation in wet or retentive soils. In hilly districts and on sandy and gravelly soils the case is different, and there need be no more delay than is occasioned by the unfavourable weather. Stake and tie such as require it as the work proceeds, and finish off with a mulching of half-decayed materials to keep out frost. In new planting the soil should be trenched two spits deep beforehand, and, if poor, a heavy dressing of decayed manure should be worked in with the staple. Where *Rhododendrons*, *Azaleas*, and other shrubs preferring a peaty soil are going to be planted, and the natural soil of the locality is unsuitable, the best way to ensure success is to clear out the old soil to a depth of 2 feet, and replace it with peat; by doing this the first cost may be great, but as a set-off against this is the success of the planting.

ROSES.—As soon as the soil is in a state fit to be trodden upon planting may be done so far as regards H.P.'s, but *Tea* and all tender varieties of the Rose will be better for being left till the spring. In planting new beds take out most of the old soil to a depth of 2 feet, and replace it with good turfy loam if obtainable, and a liberal admixture of rich manure. When setting out the plants allow a space of from 2 to 3 feet between the dwarfs; see that each one is labelled, and that a mulch is afforded the plants. Old plants that are unsatisfactory but which are worth saving may be lifted, re-planting in fresh soil. Cut off all suckers and shorten with a sharp knife any thick straggling roots. In severe weather some slight protection to *Tea* varieties should be afforded.

Turfing may still be done whenever there is an absence of frost. Never beat turf when it is frozen, this operation always destroying the appearance of it for a long time; neither let it lay in stock for a long time, but open out the turves to the light. The aspect of the garden will be rendered inviting if the lawn be kept in good order by sweeping and rolling at short intervals, but do not sweep the grass when it is wet, or the worm-casts will give it a smeared appearance. The same directions apply equally to walks made of binding materials. Shell and sea-sand walks need only to be raked smoothly at this season. The edges of the turf should be cut with the shears for the last time this season. *J. Horsfield, Heytesbury.*

### PLANTS AND THEIR CULTURE.

PANDANUS.—Although a somewhat large and varied genus there are only about half-a-dozen commonly met with. They form distinct and telling decorative subjects, and are of very easy culture; in fact, with a moderate amount of dryish heat, light, and water, good-sized specimens may be grown; but very large

specimens can be rapidly raised, if treated liberally, in large pots with rich loamy soil and an abundance of heat—indeed, large plants are only too easily grown, which often renders them unfit for ordinary decorative uses. Some of them can, however, be kept down to a small size for a few years by occasionally making cuttings of the tops. In doing this strip the leaves off the stem so far as it is firm, and then cut clean across. Put the cuttings into as small-sized pots as possible, using sandy loam for a compost. If they are now stood in a dry part of the propagating-house, and occasionally bedewed with the syringe, they will soon root, and should then be shifted into the size of pot finally required. I have found them do remarkably well placed near or over the hot-water pipes. Two of the best known—*P. utilis* and *P. Vandermeeschii*—in a small state, can in this way readily be kept for a year or two. They are both best, however, when propagated from seeds, which germinate readily. *P. utilis* is the more graceful of the two plants, the leaves being nicely recurved, and of a pleasing green colour. *P. Vandermeeschii* is more rigid, and stronger in its habit, with a whitish, glaucous bloom on the leaves, and both are densely armed with short red spines. The old stocks of the plants which have been cut down may be thrown away, as they do not readily break into fresh growth. Another good green-leaved species is *P. ornatus*. Quite different from these is *P. graminifolius*, an elegant, narrow, recurved-leaved species, which branches freely, and is very useful for table decoration. Of the variegated form the two best are *P. Veitchii* and *P. javanicus* variegatus. The former, although not the best coloured, is, nevertheless, the most serviceable plant; but *javanicus* is so formidably armed with spines that not only is it difficult to handle, but it is very liable to tear the leaves of other plants with which it may come in contact; both are striped with white on a green ground. The last-named three are easily increased from offsets, which may be put in at any time of the year and treated in the way advised for the other cuttings. If grown in plenty of light and heat they will afterwards stand a very low temperature without injury, provided they are dry at the root. Under these conditions we have successfully wintered them in a temperature not much over 50°; *P. javanicus*, being more tender, must be kept in the stove. *F. Ross, Pendell Court, Bletchingley.*

## FRUITS UNDER GLASS.

**Figs.**—The earliest trees which are to supply fruit in April will now be ready for the start. These early trees, which should be in pots and tubs, may be stood on a solid foundation, with a good depth of fermenting leaves surrounding them. This may be thought to lessen the need for the customary syringing, but it will be as well to continue it, in order to keep the trees free from red-spider and other insects. A slight syringing once or twice a week with rain-water at a temperature of 90°, with a little petroleum added to it, will keep matters right in this direction. The house should be started with a night temperature of 50°, increasing it to 55° during the day when there is no sun-heat, and to 60° when the sun shines brightly. All successional houses should be cleaned, and the trees scrubbed with a brush and soapy-water containing a little quantity of petroleum, being careful not to injure the embryo fruit in the operation. Where it is found necessary to increase the stock, short stocky shoots may be detached with a heel, about the middle of January or beginning of February, and placed in sandy loam in 48's, plunging them in bottom-heat, and in all other respects treating them as Vine eyes. Any plants struck last year may now be shifted into 21's and stored away in a cool house until the turn of the year.

**Melons.**—Where fruit is still swelling a steady temperature of 75° should be maintained, and when the fruits show colour a dry and genial atmosphere is required.

**Cucumbers.**—A night temperature of 65° to 70° will now be sufficient for these; allow a little ventilation on all favourable nights. Do not pinch the point so much as previously recommended, but rather encourage a slight extension of the bine. Be careful not to overcrop, and continue to supply slight, rich top-dressings. If greenly appears, fumigate slightly on three successive nights, and well syringe with tepid water the first thing in the morning. Syringing the plants overhead generally should now be discontinued.

**Strawberries.**—Where ripe fruit is in request in February no time should be lost in getting the necessary quantity of plants in readiness. The best method of starting these probably is to insert a quantity of 4-inch diameter drain-pipes into a bed of leaves in a pit with a rather flat roof, standing each pot within the pipe—the heat ascends the pipes around the roots and hastens the forcing process. The pots may also be plunged to half their height in a bed of leaves; but this plan results in the loss of roots, which soon make their way outside the pots. No time should now be lost in storing the whole stock for the winter, and I find no system better than standing the pots on a good depth of cinder ashes and packing them all round with leaves. I consider this superior to wintering in frames. *Wm. M. Bailie, Luton Ho.*

## THE HARDY FRUIT GARDEN.

**PLUMS.**—Plum trees will succeed in all districts in any suitable soil, and may be grown as standards or pyramids, or against walls, with the exception of 1 foot to 8 feet apart, and to keep them in a fruitful state they should be lifted every four years. A few of the choicest kinds, such as *Jefferson's*, *Coe's Golden Drop*, *Golden Gage*, and others, should be grown against a wall with a north-western aspect, as the fruits from trees in this position are valuable late in the season. For the earliest crop *Rivers' Early Prolific* is undoubtedly the best variety, grown either as a standard, fan-trained against a wall, or as a cordon. For growing as pyramids, bushes, and against walls the following are the best, viz.:—*Rivers' Early Prolific*, *Early Orleans*, *July*, *Bryanston*, *Golden and Green Gages*, *Angelina Burdett*, *Belle de Septembre*, *Autumn Compoète*, *Prince of Wales*, *Coe's Golden Drop*, *Jefferson's*, *Denyer's Victoria*, *Orleans*, *Belle de Louvain*, *Black Imperial*, *Kirk's*, *Pond's Seedling*, *R-d. Yellow*, and *Purple Magnum Bonum*, *Late Orleans*, and *Coe's Late R-d.* For standards, the three varieties of *Magnum Bonum's*, *Orleans*, *Victoria*, *Prince of Wales*, *Prince Englebert*, *Early Prolific*, *Green Gage*, *Eschsch*, *Belgian Purple*, and *Monarch*. I have tried them in a pyramidal form, but without success, for the few fruit they bore did not compensate for the trouble taken in the way of root-pruning and other measures to induce them to bear. The best varieties of *Damsons* are *Mitchelson's*, *King of Damsons*, *Farleigh Prolific*, and the *Prince of Shropshire*.

**Cherries.**—These like a well-drained open soil, and succeed when grown in the same way as Plums, with the exception of the *Morello*, which, in midland and northern counties should be accorded a wall, and for late crops one facing north. For private gardens the most profitable method of growing Cherries is as bushes. Grown in this form they bear excellent crops yearly, and moreover the fruit is easily protected from birds. In forming a collection half-a-dozen trees of the *Kentish Black* should be included, as it is a very useful fruit, continuing in use until the *Morellos* are ready for gathering. For growing against walls the following are well proved varieties, viz.:—*May Duke*, *Verger's Early Black*, *Rivers' Early*, *Elton*, *Black Eagle*, *Bigarreau*, *Governor Wood*, *Downton*, *Bigarreau Napoleon*, *Florence*, *Royal Duke*, and *Late Duke*. For north walls, *Kentish* and *Morello*. As standards and bushes, *Black* and *White Heart*, *Belle Agathe*, *Kentish*, the *Bigarreaux*, *May Duke*, *Downton*, and *Elton* can be recommended.

**Apricots** delight in a deep, rich, and well-drained loam, and they succeed only in this country outdoors when grown against walls facing south, south-west, and west. As the trees require a great deal of water during the various stages of growth, it is most essential that the borders should be well drained. I find maidens are the best for planting; they grow away more rapidly, and are not so subject to summing and losing their branches when they become established, as on the two and three year old trees. It is always best to plant the trees where they are to remain, for they are very impatient of being lifted after they get beyond a certain size. Of sorts, the following are the best:—*Moor Park*, *Hemskirk*, *Kaisha*, and the *Large Early*; the latter is an excellent variety, and the individual fruits can be grown as large as Peach by judicious thinning and careful attention to watering the border.

*Peaches* and *Nectarines* require to be grown on the same aspects as *Apricots*. The soil should consist

of a good mellow loam, with an admixture of lime- rubble if of a heavy nature. The following is a list of good varieties, viz.:—*Alexander*, *Belle Beauce*, *Barrington*, *Noblesse*, *Grosse Mignonne*, *Royal George*, *Stirling Castle*, *Bellegarde*, *Alexandra*, *Noblesse*, *Prince of Wales*, *Walburton*, and *Late Admire*.

Of *Nectarines*, *Balgown*, *Elruge*, *Hardwick Seedling*, *Rod Napier*, *Downton Improved*, *Newton*, *Pineapple*, *River's Orange*, *Violette Hative*, and *Humboldt* are a few of the best varieties. *A. Ward, Stoke Edith Park, Hereford.*

**TRANSPLANTING AND MANAGING YOUNG FRUIT TREES.**—The season of the year has now arrived when the transplanting of fruit trees should be taken in hand and carried out with all the expedition possible, as it makes a great difference in the welfare and speedy establishment of the plants whether the operation is conducted now or later, for at this time of year the roots soon get to work again, and when the buds start they will do so strongly; whereas if the removal of the trees is left till the spring they must of necessity break weakly, and make slow progress afterwards. In gardens where there are many wall trees to maintain in a fruitful state, it is a good plan to keep buying in, or working up a few young plants every year, so as to get them trained and grown on to a suitable size and shape for filling gaps as such occur, or take the place of others that are not doing satisfactorily, as by managing in that way there is little loss of time in filling up vacancies, and little difference in the supply of fruit, as trees of the stamp referred to soon come into full bearing, for being on the spot, they can be lifted and replanted with but little check to the plants. In starting with maidens, or two-year old stuff, it is not necessary to have walls to train on, any fence, hurdles, stakes, or rails, answer for a backing or support very well, and for most of the trees obtained from nurseries are put into shape on the one or the other. The first act of gardeners on receiving fruit trees from the raisers, after unpacking, used to be to cut them back, but this barbarous system is now only practised by the few, and cannot be too strongly condemned, as it serves no useful purpose, instead of which, the plant beheaded has to do the same work over again, and is little, if any, better or bigger at the end of a season's growth than when brought in. [The tree must have a basis of shoots to the number of 4 to 5 on each side.] With plants treated more naturally there is none of this, and all that is needful is to cut out any misplaced shoot that will not be required for a main branch, and then all the rest may be laid in to the right or left, keeping the middle portion of the tree clear and open, as the thing is to get the sides filled up first, for the centre of growth being furnished easily after, the tendency of growth being towards that part where the chief rush of sap sets in and flows, causing strong shoots to emerge. In preparing for the planting, it is very important that the ground be trenched or well broken up to a good depth, but on no account should manure of any kind be used for stone fruits, as it only forces rank shoots, which in the case of *Apricots*, *Cherries*, *Plums*, *Peaches*, and *Nectarines* is to be avoided, for wood of that kind is apt to gum, and seldom gets ripened.

The safest and best help that the tree can have is a little fresh turfy loam chipped up moderately fine, and if of a calcareous nature all the better, but if not, a small quantity of dust chalk should be added and well mixed with the soil, as that suits the trees when the fruit is stoning, and also assists in consolidating and hardening the wood. *Apples* and *Pears* like rather stiff land, and where it is not naturally of that character it may be much improved by working in some clay that has been exposed to the air and become pulverised, or a dressing may be put on and left for the action of frost to shiver it, after which it will mix in and do an immensity of good to the trees. In planting these it is always advisable to keep them above the ordinary level, and it is essential to the well doing of *Pears* on the *Quince* stock that the junction or part where they are worked be buried, as otherwise the swelling of the stock is so slow that the tree on it is starved. With the planting complete the next thing is to mulch, and this should always be done with both small trees and big ones, as the mulching is a great protection against frost, and conserves the warmth in the ground by intercepting radiation of the heat, and this uniformity of temperature assists materially in the quick formation of roots and the re-establishment of the plants after removal. *J. S.*

Advertisers are specially requested to note, that, under no circumstances whatever, can any particular position in the paper be guaranteed for advertisements occupying less space than an entire column.

#### SUBSCRIBERS TO

**THE GARDENERS' CHRONICLE** who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

W. RICHARDS, 41, Wellington Street, Strand, W.C.

**GARDENERS' CHRONICLE OFFICE TELEGRAMS.**

### APPOINTMENTS FOR THE ENSUING WEEK.

#### SHOWS.

WEDNESDAY, Nov. 28.—The Hartlepoons (two days), Luton.

#### SALES.

MONDAY,	Nov. 26	Dutch Bulbs, at Stevens' Rooms. Dutch Bulbs, at Protheroe & Morris' Rooms. Plants and Bulbs, at Small's Rooms.
TUESDAY,	Nov. 27	Dutch Bulbs, at Stevens' Rooms. Orchids, established, imported, and in flower, at Protheroe & Morris' Rooms. Bulbs, Roses, and other Plants, at the City Auction Rooms, by Protheroe & Morris.
WEDNESDAY,	Nov. 28	Dutch Bulbs, at Stevens' Rooms. Lilies, Greenhouse Plants, and Bulbs, at Protheroe & Morris' Rooms. Clearance of Greenhouse Plants and Ferns, at the Hornsey Nurseries, by Protheroe & Morris. Plants and Bulbs, at Small's Rooms.
THURSDAY,	Nov. 29	Lilium auratum and African Tuberoses, at Stevens' Rooms. Dutch Bulbs, at Protheroe & Morris' Rooms.
FRIDAY,	Nov. 30	Imported and Established Orchids, at Protheroe & Morris' Rooms. Freehold and Leasehold Nurseries, Barnet, at the Auction Mart, by Protheroe & Morris. Bulbs and Plants, at Small's Rooms.
SATURDAY,	Dec. 1	Dutch Bulbs, at Stevens' Rooms. Dutch Bulbs, at Protheroe & Morris' Rooms.

More about Begonias. In a recent article relating to a serviceable little book lately published at the *Gardening World* office, we took an opportunity of summarising the chief points in the history of the tuberous Begonias as we now know them. Although we have them of almost every shade of colour except blue, and of all sizes from that of a shilling to that of a saucer, we are still not satisfied, nor, indeed, ought we to be; till it is clear that we have exhausted all the possibilities of the case, and then we must, as the modern cant phrase has it, make a new departure. Every one who sees the tuberous Begonias must wish that their season could be prolonged. And there are already indications that this result will be attained to. "Oh! but," some will say, "how are we to get light enough under our gloomy, often foggy skies to develop the flowers?" Such objectors forget the fact, that the flowers are not necessarily made under those unpropitious auspices, and that even if their

foundations were not laid and their plan sketched out very long before, yet the materials out of which they are framed have been stored up ready for use some time before, so that we doubt not our gardeners, by clever adaptations, which they so well know how to practise, will, relying on these facts, be able so to manage their plants as to have them early or late at will. In the meantime, a better prospect of doing this is afforded by cross-breeding and hybridisation.

We have already alluded to the brilliant results in the way of autumn-flowering Begonias, of which John Heale and "Adonis" afford illustrations; and we have alluded to the crosses with B. Froebeli raised in Messrs. VITCHER'S establishment, and to which we look forward with eager interest.

M. LEMOINE, of Nancy, has also been at work, using the large white-flowered Begonia octopetala as one of the parents, and the result, according to a photograph which we have before

FIG. 84.—PINUS PINEA. (SEE P. 602.)

us, is so striking, that we lose no time in letting our readers know what they may expect to see in the near future. It is best to let M. LEMOINE speak for himself:—

"I beg to send you a photograph taken from a specimen of a new race of autumn flowering tuberous Begonias, which may, perhaps, have some interest to you. It is the result of a cross which I made some years ago between the white-flowered Begonia octopetala and some of the finest of the tuberous section. As you may judge from the photograph, the result is a magnificent one, and the new race, 'octopetala-Lemoinea' is one of the handsomest which I have ever raised. The root is somewhat irregularly lengthened, black, intermediate in shape between the long root in B. octopetala and the spherical corm of a tuberous Begonia. The herbaceous stem is very short, so that the leaves seem to be radical; these are broad undulated, of a glossy green, with round, hairy stalks. The plant bears from six to eight erect flower-stalks, thick and hairy, about 2 feet high, and each supporting from five to seven flowers, which open at the same time. The individual blooms, male and female, attain the size of 8 inches or more across,

and are composed of six to eight large oval petals which give them somewhat of the shape of Anemone japonica or Anemone fulgens.

"A nearly complete range of colours, from pure white to scarlet, with various shades of pink and carmine, is to be found in this new class, which produces a beautiful show of blooms at a season when the brightness of the tuberous Begonias is over. The photograph was taken on November 10 in my nursery, from a variety with pink flowers, one-sixth natural size. V. Lemoine."

**THE LATE DR. ASA GRAY.**—We have received a "chronologically arranged list of the writings" of this botanist, as beloved as he was eminent. Dr. GRAY began to write in 1834, his first article, as it happens, being devoted to mineralogy. From that time, year by year, the roll of contributions in the shape of books, articles, memoirs, reviews, and obituary notices was unceasing till the present year, which has three entries, one being the "Botanical Necrology for 1887." In a few years only two or three original contributions to science are noted, but in many years they reach to as many as twenty. Even more numerous are the "botanical notices" and book reviews, issued during the same years. The whole record with index occupies no fewer than sixty-seven octavo pages of small, unladen type. When we remember that by far the greater and more important part of this is the record of actual work and investigations carried on by the author himself, investigations generally necessitating a large expenditure of time and labour, we can but feel astonishment at the patience and perseverance thus conspicuously manifested. Nor must the quantity alone be considered, far more important is the quality; and here, although many of the criticisms are of relatively ephemeral interest, the record of actual work done is such as to secure for ASA GRAY a place amongst the highest so long as botany endures.

**THE ROYAL MEDAL.**—One of the Royal Medals in the gift of the Royal Society, has this year been awarded to Baron Sir FERDINAND VON MUELLER, of Melbourne, in recognition of his long and unvaried labours as an explorer, a collector, and an investigator of the Australian flora. Sir FERDINAND has found time to do much towards popularising the science by his educational writings, and has also worked hard in the development of the economic resources of the great Australian continent, so that the compliment is thoroughly well earned.

**A ROSE CONFERENCE** is in course of organisation by the Council of the Royal Horticultural Society. It will probably be held at Chiswick in the last week of June next.

**THE LINNEAN: November 15.**—Mr. W. CARRUTHERS, F.R.S., President, in the chair. On behalf of Mr. H. BOLUS, F.L.S., Mr. J. G. BAKER exhibited a specimen of Eriosepium folioliferum, a plant showing a very remarkable type of leaf-structure. It was figured by ANDREWS, in his *Botanist's Repository*, in 1807, and lost sight of until recently re-found by Mr. BOLUS in Namaqualand. Professor STEWART exhibited a substance which had been picked up on the sea-shore, the nature of which it had puzzled many to determine, its structure being regarded by some as animal, by others as vegetable. He proposed to submit it to careful microscopical examination. Mr. J. E. HARTING exhibited a South American bat from Trinidad (*Nottilis leporinus*), alleged to be of piscivorous habits, and remarked upon a similar habit which had been observed in a species of Pteropus in India. A paper was read by Mr. B. D. JACKSON, on behalf of Mr. H. CHICHESTER HART, on "The Mountain Range of Plants in Ireland," which was criticised by Mr. J. G. BAKER, who gave an interesting sketch of the characteristics of the Irish flora. Two papers were then read by Mr. STADEN on the mammals and birds collected by Mr. H. N. RIDLEY, in Fernando Noronha, in the deter-

mination of which the author had been assisted by Mr. O. THOMAS and Mr. R. B. SHARPE. The next meeting of the Society will be held on December 6.

**HORTICULTURAL CLUB.**—The second monthly meeting and dinner of the session was held at the Hotel Windsor, Victoria Street, Westminster, on Tuesday evening, 20th inst., when there was a very large attendance of the members, Mr. Harry J. Veitch occupying the chair. There were present the Revs. W. Wilks, F. H. Gale, and F. R. Burnside, Messrs. A. Moss, T. W. Girdlestone, E. R. West, Bunyard, H. J. Pearson, A. Pearson, J. Walker, W. B. May, A. F. Barron, R. B. Cater, W. F. Cooling, P. Crowley, W. J. Jefferies, the Hon. Secretary, and after dinner a paper

seconded by Mr. G. WHEELER, and resolved, that the best thanks of the meeting be given to Messrs. WILLIAMS, LAING, CANNELL, LOWE, and CHARD, for plants and cut flowers; to Mr. THOMPSON, of Clovenfords, for fruit, and to other friends for kindly assistance.

**CHAMBRE SYNDICALE OF GHENT.**—At a meeting held on the 12th inst., the following awards were made:—

*First-class Certificates.*—To *Odontoglossum grande*, from M. Maurice Metdepenningen; to *Cattleya Bowringiana*, *Odontoglossum Alexandræ* var. extra, *Cypripedium Haynaldianum*, and to *Oncidium Cavendishianum*, from M. J. Bray; to *Cyclopse speciosa* and

—the white, the dull green, and the dark brown. Respecting Ramie fibre, the Assistant Director reports the result of recent trials made in Paris of machinery adapted to clean the fibre and free it from gummy matter. Unfortunately the results were not satisfactory, and "the exploitation of Ramie (*Boehmeria nivea*), in spite of years of labour and the expenditure of large sums of money upon it, cannot be said to have yet emerged from the experimental stage."

**BOTANY AT THE UNIVERSITIES.**—The readership in botany in Cambridge University has been conferred on Mr. FRANCIS DARWIN, who now fills the office vacated by Dr. VINES. The latter gentleman is now Sherardian Professor of Botany at Oxford.

FIG. 85.—PINUS PINEA IN THE ROYAL GARDENS, KEW. (SEE P. 602.)

was read by Mr. G. Bunyard, on "November and December Pears," an interesting discussion, in which Messrs. Veitch, Pearson, Barron, and others took part, followed, and a vote of thanks was accorded to Mr. Bunyard. The Secretary was requested on behalf of the Club to write a letter to Mr. John Lee, expressive of their sincere sympathy with him in his serious illness, and expressing the hope that he might soon again be amongst them.

**UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.**—The usual monthly meeting of the above Society was held at the Caledonian Hotel, Adelphi Terrace, Strand, on Monday evening, November 12, Mr. J. WHEELER in the chair. Two new members were elected. The committee are glad to say that the annual dinner was a decided success; and it was proposed by Mr. J. HUDSON, and

*Lælia autumnalis*, from M. Louis Desmet-Duvivier; to *Bouvardia President Cleveland*, from M. Ed. Pynaert-Van Geert and from M. F. Desbois; to *Cypripedium regale*, from M. Jules Hye-Leyden; to *C. Madame G. Vincke*, from M. G. Vincke-Dujardin, of Bruges; to *Vriesia Delangei*, from M. Delanghe-Vervaeke.

*Cultural Commendation.*—To *Oncidium ornitho-rhyncum* from M. Alf. Van Imschoot.

*Commendation for Novelty.*—To *Cypripedium Mrs. Canham*, from M. James Bray.

**"KEW BULLETIN."**—The November number is occupied with articles concerning Lagos rubber (*Ficus Vogelii*), Liberian Coffee (*Coffea liberica*), various food grains of India, including the huskless Barley of North-west India. It appears that three varieties of huskless Barley are cultivated in Thibet

It is time that in our great universities there should be, not one, but at least three Professors of Botany, so impossible has it become for any one man to teach effectively all departments of the science, much less make independent researches—as to our thinking an University Professor may be expected to do, and indeed generally does.

**PIERRE THOMAS DUCOURAN.**—The name of this naturalist will not be familiar to many, and, so far as this country is concerned, it is to Mr. PETER BARR that the rescue from oblivion of the name and deeds of a remarkable man is due. Mr. BARR narrated in our columns on March 10, 1888, his astonishment at the inspection of a series of drawings of plants, insects, birds, &c., of the neighbourhood of Bayonne, which he made in passing through Biarritz. M. DUCOURAN was born at Biarritz in 1810, and at

first taught mathematics at Bayonne, and was afterwards engaged in commercial pursuits at Paris and Nancy, and retired to Biarritz in 1865, where, until his death in 1874, he occupied himself in arranging his numerous notes on natural history. Many of the drawings were executed by his daughter. A short note on Mr. DUCOURAU's career is given in the *Courrier de Bayonne*, a copy of which is before us.

**THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.**—At a meeting of the committee, held on Thursday, the 15th inst., it was determined to hold the fiftieth annual general meeting of the subscribers at SIMONSON'S, Strand, on Wednesday, January 16 next, and to add on that occasion fourteen pensioners to the list, five without election, under Rule 6, and nine by election among the subscribers. The voting-papers will be issued on or about December 15. The usual annual friendly dinner of the members will take place after the meeting, and the Very Reverend S. REYNOLDS HOLE, Dean of Rochester, has consented to preside. A special committee has been appointed to consider the best manner of celebrating the year 1889, that being the fiftieth, or Jubilee Year of the Institution. On November 28, 1888, E. R. CUTLER will enter upon his seventieth year, and in January will complete his forty-sixth year as Secretary of the Institution.

**TYPE WRITERS.**—Type writing seems to be making advances in this country, some of our nurserymen having adopted the system, and most of the United States firms correspond in this manner. Editors would often be glad if more of their correspondents wrote by machinery. The Remington Co. held a meeting at Anderton's Hotel lately, when the latest improvements in their machine were demonstrated to members of the Press. In the new pattern (No. 5) the action is simplified, and new characters are introduced.

**CYPRIPEDIUM INSIGNE SANDERÆ.**—A small plant with a single growth and one flower of this superb variety realised 70 guineas by fair competition, without reserve, at Messrs. PROTHROE & MORRIS' auction rooms, on Friday, November 16. It is a fine and distinct variety, the like of which has not been seen, or anything resembling it. It will be best described by saying that it is a C. *insigne* with clear, citron-yellow, waxlike, and shining flowers, the upper third of the dorsal sepal being pure white, the only and almost imperceptible marking being some ten or twelve brown dots, like fly-spots, up the median rib of the same.

**THE COPLEY MEDAL.**—The COPLEY Medal of the Royal Society, the highest award in the gift of the Society, has this year been awarded to Professor HUXLEY.

**THE WEATHER PLANT.**—We have had so many inquiries about this, and our friends have sent us so many newspaper-cuttings referring to it, that we think it right to state that the plant in question belongs to the same family as the extraordinary Gooseberry and the Blue Rose. All plants, to be precise all protoplasm, is sensitive to physical impressions, in some instances more so than others. That the plant in question should be able to forecast the state of the weather and give presage of earthquakes is nothing compared to what is narrated in old books as to the sensitiveness, if we remember right, of some species of *Oxalis* the leaves of which closed at the approach of the wicked and vicious, but remained unaffected in the presence of the pure and virtuous. The Weather Plant is no other than the well-known *Abrus precatorius*, sometimes called the Paternoster Pea, the seeds of which are like small beans but of a brilliant scarlet, with a patch of black at one end. They are used for beads and rosaries (whence the name), and also for diamond weights, the weight of the Koh-i-noor having been ascertained by their means. The pinnate leaves of the plant are, no doubt, sensitive to light, heat, electricity, or any

other force that would alter the tension of their protoplasm. The statement that an observatory has discarded both aneroid and mercurial barometers in favour of the Weather Plant as an indicator of forthcoming weather is one of those statements that we should receive with an open mind, so that what passed into one ear might speedily escape by the other! When we receive information from some other source than newspaper gossip we shall be bound to accord the matter more consideration.

**THE GARDENERS' ORPHAN FUND.**—On Wednesday, the 14th inst., a grand concert, promoted by the gardeners in and around Chesterfield, was given in the Stephenson Memorial Hall, Chesterfield, the proceeds of which are to be handed over to the above fund. In addition to the usual attractions the large hall was very tastefully decorated with autumnal foliage and flowers. The concert was under distinguished patronage. The decorations were ably carried out by the committee under the direction of Mr. OWEN THOMAS, of Chatsworth (the local hon. secretary to the Fund), assisted by Mr. FOSTER, chief Orchid grower at Chatsworth. The chair was taken by the Hon. and Rev. R. E. ADDERLEY, Vicar of Chesterfield, who spoke in very favourable terms of the objects of the Society. A ball was given in the same hall on Friday, the proceeds of which are also to be added to the fund.

**INDUSTRIAL EXHIBITION, PARIS.**—We read in the *Devon and Exeter Gazette* of November 20, that awards have just been made at the Industrial Exhibition now being held in Paris in connection with the manufacture of cider and perry, and the result is eminently satisfactory to the county of Devon, considering that the competition was an open one. The first prize (Diploma and Gold Medal) has been awarded to Messrs. ROBERT VEITCH & SON, of the Royal Nurseries, Exeter, for a collection of Apples suitable for making cider. These Apples were collected from cider districts, and included all the standard varieties, as well as some new sorts raised by leading cider-makers. The second prize for cider has been awarded to Mr. CHARLES HAM, of Exeter, as also another prize for Apples used in the process of manufacture.

**INSTITUTE ROAD.**—The road long-talked of across the whilom Royal Horticultural Gardens at South Kensington, is now an accomplished fact. All the better—the sooner the memory of the "Commissioners and all their works" is banished from the minds of horticulturists the more charitable they are likely to feel towards their oppressors.

**CHERRIES.**—Our *English Home*, as quoted in *Notes and Queries* (1861), p. 148, contains the following:—"Cherries grew in Holborn in the same century (thirteenth); HENRY III. ordered them to be planted at Westminster; and GILES DE ANDENÆRD, the Royal Gardener in the reign of EDWARD I., also planted some Cherry trees in the same garden."

**THE LATE MR. COURT.**—The New York Florists' Club at a recent meeting adopted a resolution of sympathy and condolence on the occasion of the death of Mr. COURT.

**BOARD OF AGRICULTURE.**—The Government proposes to withdraw their proposed Bill for the establishment of an Agricultural Department, but hope to reintroduce it another session.

**THE NATURAL HISTORY MUSEUM.**—According to statements in the House of Commons, the Museum will shortly be opened in the evenings, thanks to the possibilities of electric lighting.

**THE FLOWER TRADE.**—No. 61 of the Cobden Club Leaflets, says a contemporary, has some very wholesome truths for English flower growers; but it is, perhaps, just a trifle hard on them in some of its criticisms. The flower trade of London, it is pointed out, is estimated at the value of £5000 a day, and the fact that the whole of this very considerable business is not done exclusively by English growers seems to

be attributed entirely to neglect and want of energy. This is hardly fair, because it cannot be denied that the growers of the Riviera have a very decided advantage over our own people in the matter of climate. But, says the leaflet, "if we have not the suitable climate we can make it." That is true to a certain extent, but only to a certain extent. To make the climate of Southern France under English skies is rather troublesome and expensive, and, moreover, cannot be entirely accomplished at any price. It is always possible to get a certain degree of heat and moisture, but unfortunately it is not always possible to get sunlight, and without that floriculture is grievously handicapped. There are, however, some important suggestions, and many curious and interesting facts embodied in this little leaflet. Otto of Roses, we learn, is exported from one locality in Roumelia to the value of £44,000 a year, and it has been calculated that to make this there are grown in that one place alone no less than 10,104,000,000 of blooms. Roses grow there, and are dealt with very much as Hops are in Kent.

**CHRYSANTHEMUM CONFERENCE AT SHEFFIELD.**—Advantage was taken of the presence of so many Chrysanthemum fanciers at Sheffield to hold a conference on the evening of Friday, the 16th inst. Mr. JOHN WRIGHT was voted to the chair, and having briefly opened the proceedings, he stated that was the first meeting of Chrysanthemum growers in conference, which he thought was a fitting accompaniment to the first Provincial Show of the National Chrysanthemum Society. Papers were read by Mr. W. TUNNINGTON, of Liverpool, whom the Chairman introduced as an authority on the incurred Chrysanthemum; and Mr. MOLYNEUX.

**THE CHRYSANTHEMUM CENTENARY.**—A correspondent writes:—"Whilst no one can question the right of the National Chrysanthemum Society to lead in the proposed centenary celebration of the Chrysanthemum, it would be very interesting if that body would inform the public what grounds it has for assuming that 1789 was the exact year in which the Chrysanthemum was first introduced into England. The evidence on that point should be incontestable. I hear that, owing to the needs of the case, the celebration must be deferred to 1890, which so far may be a wise step, as it will leave the exact date of the introduction of the Chrysanthemum here less open to question, whilst it will give ample time for the promoters of the celebration to deal with the matter in a broad spirit. It would be an excellent idea could Chinese and Japanese gardeners be imported over here early in the year for the purpose of producing examples of their methods of culture of what is now the most popular of garden flowers."

**THE COLLECTION OF CHRYSANTHEMUMS** in the gardens of the Royal Horticultural Society, Chiswick, numbering about 2300 varieties, is now in fine condition for inspection and criticism. The plants are arranged in the great vinery, and the arrangement is such that while they form a gigantic bank of flowers extending the whole length of the house, every plant is easily accessible for ascertaining its name and character. This display is as creditable to Mr. A. F. BARRON as any he has accomplished.

**COLNBROOK CHRYSANTHEMUM SOCIETY.**—This Society, which has its home on the borders of Middlesex and Bucks, seems to exist very much for the benefit of one exhibitor. Judging by the prize list published, which shows that this favoured individual had no competitor in the ten open classes, was placed 1st in ten others, with invariably only one competitor, and came 2nd only once, thus presenting a sort of Gardeners' Benefit Society, rather than a good local Chrysanthemum Society. It is fair to the Society to say that, in the amateur, small gardener, and cottager classes, the competition was fairly good. Very considerable reconstruction seems needful in the case of a Society of this nature, as it is absurd to

regard it as established in the interests of horticulture. That the exhibitor in question put up good stuff is doubtless the fact, but that nearly all other gardeners in the Society's wide district should hold aloof from exhibiting needs explanation.

**M. BOISSIER'S HERBARIUM.**—In our notice of this collection some time since (p. 509), we stated that this herbarium was now the property of the town of Geneva. We are, however, informed that this is an error, and that the herbarium remains in the possession of the family.

**VANDA CÆRULEA.**—A large specimen of a fine form of this species is now in flower at Priorwood, Melrose, in the collection of ALEX. CURLE, Esq. The flowers, which are veined with dark blue on a sky-blue ground, are 4 inches across, the larger lower segments 2 inches, the whole well rounded. The plant is about 4 feet high, measuring from the top of the pot, and it has twenty-four leaves on each side, and two spikes, one with fifteen and the other with sixteen flowers.

**MASDEVALLIA MACRURA.**—Even considering the genus to which it belongs, this species is a remarkable one. In the size of its flowers it is probably exceeded only by some of the varieties of *M. chimera*. A plant now flowering at Kew has flowers measuring 10 inches across the sepals. The long scapes produce several flowers, but singly, and at intervals.

**HAMMERSMITH HORTICULTURAL SOCIETY.**—The autumn show was held on November 15, at the Athenæum, Shepherd's Bush. Sir THOMAS LAWRENCE, M.P., visited the show in the evening, and distributed the prizes. Mr. LAMPARD, Chiswick, took the 1st prize for his group of Chrysanthemums arranged for effect, whilst Mr. WOOD, Chiswick, took six prizes for cut blooms, taking the 1st prize in each case. Mr. THOMPSON was a 1st prize winner for a group of Chrysanthemums, and took the Certificate for his premier bloom, Japanese. Messrs. JONES, WOODHOUSE, BROMLEY, NELSON, and others, also took prizes. In the fruit classes, Messrs. ADDISON and WOOD were the principal winners, Mr. DAVISON taking 1st for a collection of vegetables.

**CAMBRIDGE HORTICULTURAL SOCIETY.**—A show of Chrysanthemums was held by this Society in the Corn Exchange on the 15th and 16th inst. Cut blooms were very fine for the season, and the entries for these and specimen plants more numerous than in previous years. Unfortunately the show failed to arouse much interest among the townspeople, and visitors were few in number.

**BROMLEY DISTRICT.**—The annual show of Chrysanthemums took place at the Drill Hall on November 14 and the following day. Competition in all the larger classes was very weak, but showed improvement in the smaller ones, prizes going in most cases to the gardeners of the neighbourhood. Primulas, Grapes, &c., were likewise shown.

**BUCKINGHAM.**—This show was held on November 20 in the Town Hall, the whole of the fifty-nine classes being well taken up generally. Messrs. Corderoy, Price, Tailby, Walter, Tipler, and Bedford, dividing the honours for plants and cut blooms, and in the fruit division good specimens were contributed by Messrs. Walter, Tailby, Price, and Holton. Cottagers were well represented.

**TAXODIUM DISTICHUM.**—In the grounds of Shoreham Cottage, the seat of E. Chaplin, Esq., near Sevenoaks, a pair of these beautiful trees is growing, one of which is said to be about forty years old. It is nearly 60 feet high, and the stem measures, at 1 foot from the ground, a little over 5 feet in circumference, and, like the one at Castle Hill, Englefield, mentioned some few weeks ago in these columns, it stands on the bank of the river. The tree is in splendid health, and is certainly a beautiful object when in leaf. A large quantity of its roots are to be seen in the water just in front of the bank on which it stands. *J. Hodgson.*

## THE TREATMENT OF BANKS AND SLOPES.

It is not an uncommon mistake to find the slopes in gardens, and by the sides of roads where the surrounding ground is either higher or lower than the road, or parterre, made at too abrupt an angle, as at *a, b, c*, and *d*, (fig. 86, copied from diagrams by J. C. Olmsted, published in *Garden and Forest*, September 5, 1888). It is only in the panelled garden—a mode of laying out a flower parterre not often adopted at the present day—that such sharp slopes are admissible, and in such places they are not difficult to keep in good order, owing to their usually small depth; but in banks of four, five, and more feet in depth there are no means of preserving them in a presentable condition. The slopes are then difficult to mow, the grass becomes impoverished by the insuperable obstacle the slope presents of being mowed properly; and it is very apt to become disfigured by a few days warm sunshine, and especially when the slope is southerly, as it frequently is in terraced gardens.

Moreover, a bank of this character always needs to be backed by hard materials, if its contour is to be preserved perfectly—another cause for its dying out during sunny weather, even when the precaution is taken to cover the material so employed with clay.

In park land, which is mostly fed off by stock, the trampling of the animals in wet weather very soon destroys the first neat appearance of a steep bank; the grass then grows tufty, the rains wash out the

FIG. 86.—TYPES OF SLOPES.

soil between the tufts, and a continuous carpet of green turf is lost.

In diagram *d, e*, there is some improvement on *a, b, c*; the line is softer, but it meets the grass plot at the bottom at an unpleasant angle, and is only less formal than an inclined plane. To make it less so the top of the slope may be thrown back from its base, but it will still have an ungraceful aspect. The diagram *f, g, h*, represents the form a bank of soil of uniform texture would assume after a long interval of rainy weather, the soil being washed out near the foot of the slope and deposited on the level at a short distance from it. That is the lesson taught by Nature in this matter, and it is a pretty safe rule to follow in making a turf bank. A cross-section of such a bank is an "ogee," an architectural term meaning something moulded inward at the bottom and outward at the top, or, more broadly speaking, any reversed curve. The line *f, g, h*, is a regular "ogee," the concave portion, *f, g*, being equal to the convex portion *g, h*. In practice the proportions of a curve may be varied, and they may sometimes be made to follow the lines *i, m, n*, and *o, p, q*, and yet be of graceful proportions.

Another rule in making slopes is illustrated by the diagrams, viz., that when a broad surface of turf has to terminate at a steep slope it would be better to connect the former with the latter by means of a convex curve, as at *m, n*, completing the "ogee" by a short concave curve as at *l, m*. But, on the contrary, when the surface is intended to terminate at a steep slope rising to a fence, shrub border, or other marked boundary, the long concave curve of *o, p, q*, is more suitable.

It should be borne in mind that a slope falling to a road or path should not terminate directly at these objects, but there should be a margin of level turf varying from a few feet to twenty, according to the scale on which surrounding objects, paths, buildings, borders, etc., are laid out.

## HOME CORRESPONDENCE.

**VIOLAS AS BEDDING PLANTS.**—I consider "R.D." (p. 546) has done well in drawing attention to these plants, and I would much like to see the suggestion adopted either by the Royal Horticultural, or Royal Botanic, or both. For years they have been quite a feature at the great Whit week show at Old Trafford; but we do not see them around London figuring so conspicuously as in northern counties. Their value in the garden is annually becoming more and more apparent, while the list of really first-class varieties, exclusive of novelties, is somewhat considerable. The middle of May would make a good time to show them, using pans of about 12 inches diameter. A collection of these would make a most interesting display, which might also prove instructive, seeing it would afford abundant opportunity for comparing their habits, whether dwarf, compact, or rambling, as also their flowers, and the freedom with which they are produced; a dwarf compact habit with profuse flowering being of greater moment with them than the actual size of the flowers individually, but so much the better if size is also included with the two just named. *F. Jenkins.*

**PEARS.**—I fail to see clearly how it is possible to keep up a constant supply of fruit during the whole of the Pear season, year after year with only twelve or even fifteen varieties, as remarked by Mr. Shepard (p. 535). It is true that within that number all the very best of quality might be placed, and the greater part of the task might be got through provided we could really depend upon them all cropping constantly. But here and in other gardens where a goodly number of varieties are grown to keep up a regular supply, we should, if we were to limit ourselves to that number—viz., twelve or fifteen—be as often without fruit as with. To double that number, I think, would be nearer the mark, and none too many. I am no advocate for growing more varieties than are really needful, but as the Pear is not to be depended on for cropping annually, and I am a firm believer in having more than one string to my bow. *H. Markham.*

**CHISWICK.**—I entirely agree with Mr. Dyer's remarks as to what should be done at Chiswick, and had I known there was to be a meeting to consider it I should certainly have attended, but I had no notice. [It was a meeting of the committees only.] I am indebted to the Scientific Committee for some of the pleasantest and most profitable hours I have spent in the Society, but I believe the Society will never flourish so long as the Floral Committee exists on its present footing. It seems absurd to have a committee composed so largely of persons interested in commercial horticulture. What chance has an interesting plant exhibited by an amateur? Still more absurd is it to give medals to nurserymen for advertising themselves and their goods. Surely also the nurserymen in the neighbourhood of London have so great advantages as to locality that they might at least waive their privilege of voting on the exhibits of their less fortunate brethren in the provinces, who feel themselves unfairly handicapped by the Society. *Over the Sea.*

I am pretty confident that a few years will see the management of the Royal Horticultural Society conducted in such a way as to meet our hearty approval. At present we have very little to differ with the Council about, as it is apparent to us that whatever was the case formerly, there is now a strong feeling in the Council that the views of the general body of horticulturists throughout the country should be met and carried out as far as practicable. As this feeling spreads among us, horticulturists will gladly become Fellows, in the confident expectation that they will reap benefit for themselves and confer it upon others. Except on the score of expense I see no objection to the "office" remaining in London, nor, indeed, should I object to an office being kept open for the society in every district of the kingdom if it would advance the Society's aims and interests. The exhibitors' view of the matter is a selfish one,

and, as usual in such cases, they will stand in their own light. I still think Chiswick the place for the Society's chief work. *Head Gardener.*

Retire to Chiswick, but retirez pour mieux sauter.—It would be cheaper and more accessible. Clear out of the Drill Hall. *L.*

—In the name of common sense don't have shows at Chiswick. It is much too inaccessible and nobody will come. *H.*

—Chiswick's the place, with a few big shows in London, in the suburbs, or, in spite of the Liverpool fiasco, in the provinces.—Now-a-days Chiswick is as accessible to most of us from the country as any place in central London would be. *M.*

I see that at the meeting of the Fellows of the Royal Horticultural Society on the 13th inst., two resolutions were carried, one, that some of the meetings next year should be held in the Chiswick Gardens, the other that the Drill Hall should still be kept on. Now, I am glad to see that it is proposed that some of the Shows next year shall be held at the Gardens, and in a letter to the Secretary I advocated that proposition; but on the other hand I much regret that it is proposed to rent the Drill Hall again next year, for with the exception of, I think, the National Auricula Show and the Carnation and Picotee Show, the fortnightly shows at the Drill Hall have been most decided failures, as far as my experience of them goes; indeed, at two of them, if not more, the flowers and fruits that were advertised were not shown at all! (I allude to the absence of the Strawberries, Dahlias, and Chrysanthemums.) It would be much better, in my opinion, if the meetings were monthly instead of fortnightly, and held in the Council-room, and the shows held in Chiswick Gardens, and the rent of the Drill Hall saved and spent upon Chiswick Gardens instead. What on earth is the use of keeping up the gardens at Chiswick with the vineries, &c., if the Society will not hold its shows there? "*A Fellow, Union Club, Trafalgar Square, S.W.*"

**TABLE PLANTS.**—What constitutes good table plants, and by what rule, or rules, are they judged at shows? Is it absolutely necessary that some of them should be about 11 inches, and some 22 inches high? I only once before saw such judging as that which took place at the National Chrysanthemum Society's show at the Aquarium on November 7 last. I could not believe my eyes, and felt sure that some mistake had been made in putting on the tickets; but no—that was not so. In my opinion the best plants in the class for eight were put out of court altogether, and got no prize. I cannot now say whose they were, but a finer and better lot I have seldom seen. I will give a list of them, so that some correspondents may express their opinion about them:—Croton Countess, C. Warrenii, C. Chelsoni, Cocos Weddelliana, Dracaena angustata, D. superba, Geonoma gracilis, Pandanus Veitchii. These plants were well grown, well coloured, and regular as regarded size, which was, I think, as near the right one as possible. Why these were pardoned over I do not understand, unless the judges inadvertently overlooked them. The 1st prize lot consisted of Dracaena Percyii, D. superba, Croton Laingii, C. Countess, C. aigburthensis, 11 inches high; C. Mrs. Dorman, 12 inches high; Cocos Weddelliana, 22 inches high; Aralia leptophylla, 15 inches, which had lost its leaves at the bottom. Now, I think, if these are compared with the first-named plants, which got no prize, it will be seen that those were by far the best, and that if they had been properly judged the first prize lot should not have been in the first three lots. Now, sir, there is nothing which will do the show more harm than that the labours of the grower should be submitted to such judgment.

*Hortus.* [The prize lot consisted of four genera, and the other of three only, which may have influenced the judges, supposing that quality and adherence to the regulations were equal. But the Chrysanthemum Society was stepping outside its province altogether. *Ed.]*

**PITMASTON DUCHESSE AND OTHER PEARS.**—It may seem unnecessary to write anything respecting this well-known Pear, but it has behaved so well here this wet sunless summer that I feel I must bear testimony to its excellence. We finished our last fruit on the 9th of this month, and throughout they were excellent in flavour and cut as smooth as a Marie Louise. I would recommend it to be planted largely for market as it is of taking appearance and is as good as it looks. Many persons think that it is a seedling from the Duchesse d'Angoulême, but that is not so; it was raised at Pitmaston, near Worcester,

and the old gardener who sowed the pips and ultimately planted it on the front of his cottage, told a friend of mine that they had no record of its parentage but that it was simply the best of a great many seedlings raised in Mr. Williams' garden. While I am on the subject of Pears I would also like to sound the praises of another Pear, viz., Knight's Monarch. We have it fine this year from a south wall, and from the same shelf one can get a supply for a month or six weeks—it ripens so differently to any other with which I am acquainted. The flavour is excellent. Many years ago, when the Royal Horticultural Society held a fruit show in St. James' Hall, Mr. Ingram of the Royal Gardens, Frogmore, I remember, took the 1st prize with the Monarch, as the best flavoured Pear in the room; and at the same time and place there were prizes for the best jars of stewed Pears where the Catillac came off all before it. It is now a settled question beyond all doubt that the Quince is the stock for Pears; the fruit is larger and clearer than from the Pear stock. I have been much struck with the Quince trees in the garden here to-day. They are still full of foliage, while every Pear tree in the garden is leafless. May not this autumn growth, this prolonged vigour be of great service to the proper finishing of a heavy crop when used as a stock for the Pear? *J. Rust, Eridge Castle, Nov. 12.*

**SINGLE CHRYSANTHEMUMS.**—Having read many reports of the recent Chrysanthemum shows, I have not yet been enabled to find that in any of them a class was set apart for single-flowered seedlings of Chrysanthemums, notwithstanding our having such pretty varieties as America, bluish, shading to white; Miss Cannell, pure white, yellow centre; Canariense, a good yellow; Scarlet Gem, Aurora, maroon-chesnut; Miss Rose, white and bluish, and many others; when staged in the same way as the pompon, which are very effective. I hope those who are interested in the preparation of the future schedules will give this class careful consideration. *T. Hosmer.*

**NEMATODE WORMS.**—When delicate bulbs, such as the white Hoop Petticoat Daffodil, or other plants of weak growth, die off prematurely, I have often found on examination that their roots are infested with nematodes—that is, very small, thread-like worms, white in colour, and less than half an inch long. I have generally considered these to be the consequence of vegetable decay, but I am assured that in many cases they are the cause of it. I am recommended to try the effect of a weak solution of sulphate of copper. If any readers of the *Gardeners' Chronicle* have suffered from these tiny depredators, and have got rid of them, their experience may be of use to others. *C. Wolley Dod.*

**TRADESCANTIAS.**—The chief object of this note is to remark on the statement of "R.D." made on p. 577, that "Tradescantias do not appear to seed." In my garden in Cheshire, where the soil and climate are not very favourable for producing seeds, these Spiderworts seed to such an extent, and the seedlings come up so promiscuously, that I find them a great nuisance. It is true that the colours of flowers in seedlings vary much, but all are inferior to the blue of the type. The flowers of this plant open only in sunshine, and only one at a time on each stalk; and in wet weather it becomes top-heavy and untidy. It is true that the individual flowers are beautiful, and the plant may deserve a place in sunny gardens; but after tolerating it for ten years, I have expelled it from my newer and choicer borders as a second-rate plant. *C. Wolley Dod.*

**CANKER IN APPLES.**—With regard to this subject and Mr. Tonks' discourse on "Canker of the Apple Tree" at the recent Apple Conference at Chiswick, I have thought the following statement, copied from exhibitors' remarks, would be interesting.—Mr. J. Deane, gardener to Granville W. Leveson Gower, Esq., Tetsey Place, Godstone, Surrey (Apple Congress report, p. 38), says:—"The situation is well sheltered and facing south, 400 feet above sea level; soil is prepared, and consists of road-scrappings with loam, and is mulched annually with stable manure. A great many of the varieties of Apples canker very badly here, whether the season be wet or dry, and every spring we have to cut out cankered wood. It seems hopeless to try to obtain a good-shaped tree in the prepared soil; but on the chalk, which is very dry, we have two specimen trees—a Ribston Pippin, and a Blenheim

Orange, planted fifty years, and growing vigorously without a spot of canker, but they give no fruit. Why is this?" This seems a strong case in support of Mr. Tonks' theory, and if any of those who are growing Apples on chalk would give further information on this very important subject, it might prove of great advantage to fruit growers generally. *John Peed, Streatham.*

**STACHYS TUBERIFERA.**—I send you a box containing two tubers of this. I have now cultivated this new vegetable for six years, at present extensively. It is as hardy as Knot-grass, not affected by frost in the least. As a salad it is sent to the breakfast table every morning with the Radishes. The tubers are now quite matured, and are employed for a second-course vegetable. An intelligent cook will find it useful in many ways; as it is tender, its delicate aroma can be brought out in various ways. It ramifies beneath the surface of the soil all round the stem, as may be seen in the specimens which I send to you. The soil should be of a free porous nature, and on heavy soils sifted coal-ashes and leaf-mould mixed with the staple assists it materially. The ground should not be hoed too deeply, only scratching the surface, as it is easy to hurt the tubers. The plant is even more profitable than French Beans, and at this season and during the winter the tubers are welcomed as a variety in vegetables. It should now be stored in drish earth or sand—not in damp materials, as with the latter growth is apt to recommence. I recommend every one to plant it; it gives an abundant return for a very little outlay for "seed" and labour, and requires the least possible amount of attention. It may not be necessary even to replant the ground, as the small tubers left in the ground are sufficient to stock it. Merely give a good dressing of manure, and fork over the ground, and a heavy crop will grow. *P. Middleton.* [The number of good-sized tubers on the roots sent was extraordinary. *Ed.]*

## PLANT PORTRAITS.

- ÆSCULUS TURBINATA*, *Revue Horticole*, November 1.—Fruits top-shaped, spineless.  
*CATALPA LABIATA*, var. *MAGNIFICA*, *Gartenflora*, September 15.  
*CYRTIPEDIUM MEASURESIANUM*, *Revue de l'Horticulture Belge*, November.  
*EPIPENDRUM MEMORALE*, *Lindena*, t. 155.  
*EPIPENDRUM MEMORALE*, *Orchidophile*, October.—Flowers large, reddish-violet, sepals and petals narrow, spreading, lip broadly obovate acute, whitish, with violet veins.  
*MESOPITINDIUM VULCANICUM*, *Lindena*, t. 154.  
*PHLOX NANA*, *Garden and Forest*, October 24.  
*QUEENELLA MAGNIFICA*, *Gartenflora*, September 15.  
*STANOPEA RUCKERTII*, *Revue de l'Horticulture Belge*, November.—Flowers white, lip with two orange spots at the base.  
*SYRINGA PUBESCENS*, *Garden and Forest*, October 24.

## SOCIETIES.

### EDINBURGH BOTANICAL.

NOVEMBER 8.—The first meeting of the session was held in 5, St. Andrew Square, Dr. Craig, President in the chair.

The President in his opening address referred to the losses in membership during the last session, especially noting the decease of Professor Dickson and Dr. Boswell. He also deprecated as a down thrust to Scottish botanical science, the proposed transfer of the Royal Botanic Garden from Government to the University, as at present proposed in the Universities (Scotland) Bill now before Parliament.

The President next gave in the report of the excursion of the Scottish Alpine Club to Sutherlandshire during the closing days of July and the opening one, of August last.

Professor Bayley-Balfour exhibited a gynanthous Foxglove, discovered by the late Professor Dickson two years ago. The stamens of each flower, usually five, had all been converted into carpel-like processes, bearing ovules in an exposed position. The Professor also exhibited specimens of Wallflower and Poppy with stamens similarly modified.

Mr. Lindsay reported on the weather and vegetation of the Royal Botanic Garden for July, August, September, and October.

## ROYAL HORTICULTURAL. Scientific Committee.

NOVEMBER 13.—Present: Dr. M. T. Masters, in the chair; Mr. Pascoe, Mr. W. G. Smith, Mr. Michael, Professor Boulger, Professor A. Church, Professor Scott, and Rev. G. Henslow, Hon. Sec.

A report on the experiments made at Chiswick with reference to high moulding of potatoes was read (see ante p. 572).

*Potato Reversion*.—Mr. W. G. Smith mentioned that eighteen years ago Mr. Fenn crossed two long sorts of kidney Potatoes, viz., the Early Coldstream and the Early Ashleaf, the result being a variety of a globular form, which he called "W. G. Smith." After eighteen years, during which this had come true, one plant suddenly reverted to the original type, being  $5\frac{1}{2}$  inches long, the round tuber being only about  $2\frac{1}{2}$  inches in diameter.

*Ivy Blossoms Malformed*.—Dr. Masters exhibited specimens and drawings by Mr. W. G. Smith of a very unusual condition of Ivy flowers, in which the "disc" on the summit of the ovary had become hypertrophied into a thick ring or cup, the style occupying the depression in the centre, the border of the ring supported about ten anthers, all being supernumerary, as the normal number was present at the outside of the base of the ring. The specimens were sent by Mr. Archer Briggs.

*Oak Timber, Defective*.—Dr. Masters exhibited for Mr. Burbridge specimens of Oak-wood which was used for spokes of wheels, which was found to break off short. It was referred to Professor Marshall Ward for examination and report.

*Pinus Lambertiana*.—Dr. Masters exhibited a branch of this species, received from Mr. C. Herrin, of Dropmore, Maidenhead, with two cones about 1 foot long. The size when growing naturally in California is said to be double that of the present specimen.

*Cleistogamous Lawn Plants*.—Mr. Henslow showed specimens of several species of plants which are propagated by cleistogamous flower-buds. By that means, while retaining a dwarf habit, they are able to multiply very rapidly, and to extend over considerable areas in a tennis-lawn. Although none of them are perennials, they remain so reduced in size that they are not exterminated by the mowing-machine periodically cutting them down. The result is that each species has more or less completely covered certain patches of ground, to the almost entire exclusion of everything else. The plants in question are *Cerastium glomeratum*, *Montia fontana*, *Trifolium procumbens*, *Sagina procumbens*, *Alchemilla arvensis*, *Veronica arvensis*, and *Poa annua*. Mr. Henslow added that he had observed many years ago *Trifolium subterraneum*, flourishing in the same way on the close-cut grass in Kew Gardens, on the site of the present rockery.

*Rumex crispus, gynodioecious*.—Mr. Henslow exhibited specimens of this plant, which bears hermaphrodite flowers on longer, with female flowers on shorter pedicels, thereby forming whorls along the main peduncle. It does not appear to have been described in any work as being in this condition.

*Cotyledon umbilicus, abnormal*.—Mr. Henslow exhibited a specimen and leaves of this plant, found growing in a wall at St. Ives, Cornwall, the peculiarity being that it bore a flat, expanded, rosulate arrangement of leaves exactly like the House Leek, *Echeveria*, or several sorts of Saxifrage. The leaves were spatulate and not petiolate at all. Some few growing freely were funnel-shaped.

*Raspberry and Blackberry Hybrid*.—Mr. Henslow drew attention to the foliage of a supposed hybrid received from Messrs. Viccars, Collyer, of Leicester. The plant blossomed, but bore no fruit this season. The flowers were exactly like that of the Raspberry, as well as the tomentose under surface of the leaves; but the method of forming the quinate leaf out of the ternate agreed with that of the Blackberry as follows:—The simplest form of leaf is a single oval leaflet near the flowers. This becomes lobed at the base, and so two leaflets are given off, forming the ternate leaf. From the basal pair in the case of the Blackberry two more are given off, and thus form a quinate leaf, the lower four leaflets being nearly "palmate." In the Raspberry, however, the second pair of leaflets are given off from the terminal leaflet, just as were the primary pair. Consequently the five leaflets now form a more decidedly pinnate leaf. In the hybrid in question, although in all other features it agrees with the Raspberry, yet in this one particular it resembles the Blackberry. As no fruit was produced a comparison could not be made with them.

## BIRMINGHAM AND MIDLAND COUNTIES GARDENERS' ASSOCIATION.

At a largely attended meeting of members at the Midland Institute, on Tuesday, November 13, Mr. W. B. Grove gave a lecture on "Edible Fungi," illustrated by photographs, in the oxyhydrogen lantern, of the species referred to. These were, first, *Agaricus arvensis* (the Horse Mushroom), a species which is eaten in many parts of England, and sometimes hardly distinguished from *A. campestris*. It may be known by its larger size, thicker flesh, and yellow juice when wounded. Then the Parasol Mushroom (*A. procures*), and the False Parasol (*A. rachodes*). were described, and the latter one illustrated by a photograph of a group which, afterwards, had been eaten by the photographer; *A. nebularis*, the Clouded Mushroom; *A. ostratus*, the Oyster Mushroom; *Coprinus comatus*, the Maned Mushroom, or Wig-cap; the Beefsteak, *Fistulina hepatica*; the Morell, the Truffle, and the Giant Puff-ball were then illustrated and described; and, finally, the Fairy Champignon (*Marasmius oreades*). Two common poisonous fungi, *A. semiglobatus* and *Coprinus micaceus*, were introduced, in order to warn would-be consumers against them, and a slide, illustrative of the effects of eating poisonous species, brought the lecture to a close.

Mr. Grove recommended the eating of all the species named, each having its own distinctive flavour; but it was necessary that the tyro should be shown how to distinguish the species by careful discriminating attention, either from coloured plates or, preferably, by the aid of a better instructed friend. Good cooking was also necessary, if the true flavour was to be obtained.

## TORQUAY CHRYSANTHEMUM.

Nov. 13.—This was held in the Bath Saloons. The competition in the classes for plants was not so strong as usual, Mr. H. Yelland, gr. to Miss Loch, Villa Como, taking the 1st prize in the open class for twelve plants, distinct, and in the amateur classes for twelve plants, and also in other classes.

Orchids were shown much better than usual, Mr. Mead, gr. to Moreton Sparks, taking 1st for three distinct.

The open classes of Chrysanthemums were very good, and there was a fair competition throughout. Mr. Delling, gr. to Mrs. Wild, Whitehill House, Newton Abbot, took the 1st prize in the principal class for twelve Japanese and twelve incurved, distinct, his Japanese being the better of the two; and he also led in five other classes.

Mr. Cocks, gr. to Wyndham Fisherbert, Esq., Kingsnear, was a very successful exhibitor, and had the best incurved bloom in the show, in *Empress of India*. Mr. John Styles, gr. to Miss Frapp, took 1st in the amateur classes for twelve incurved blooms.

Grapes were excellent, especially those shown by Mr. Mars, gr. to Sir Thos. Freak, Dartmouth. He was 1st for two bunches black Grapes, with fine examples of Black Alicante and for white Grapes, Muscat of Alexandria large and good. He also took 1st for the heaviest bunch, with Gros Colmar, weighing 3 lb. 13 oz.

Vegetables were excellent, and remarkably clean. Mr. Coles, gr. to W. B. Fortescue, Acton Hall, taking 1st for a choice collection.

Messrs. Veitch, Messrs. Locombe & Pince, of Exeter, each arranged stands of decorative plants, Chrysanthemums, &c.

## CLONMEL CHRYSANTHEMUM AND FRUIT SHOW.

This now annually recurring event was held in the large Assembly-room of the Court-house, Clonmel, on Tuesday, November 13. Notwithstanding the generally unfavourable season, and that almost all the local growers lost some of their finest blooms through premature damping off, the show was an unexpected success.

*Groups*.—The requirement for admission into this section was that competitors were each to furnish a sufficient number of plants to occupy a space of 60 square feet, and the prize was to be awarded only to that collection which should best illustrate quality and effect. It speaks largely for the extent to which the culture of this flower is carried when we state that no fewer than four local amateurs entered the field as competitors in this section, and their several groups were tastefully displayed; the prizes going

to Mrs. Malcomson, Minella, Clonmel (gr., Mr. J. Crehan); 2nd, Thomas Phelan, Esq., Spring Gardens (Mr. Halpin), and highly commended, Dr. W. H. Garner (Mr. O'Shea).

*Cut Blooms*.—Twenty-four incurved blooms, not less than nine varieties. After close competition the 1st prize went to Mr. Raymond de la Poer, of Kilkronagh, Kilkenny (gr. Mr. Crawford), and 2nd to Mr. Thomas Phelan. Particularly good in the 1st were Cherub, Princess of Wales, Lord Alcester, and John Salter; and in the 2nd exhibit, Jardin des Plantes, Prince Alfred, and Lord Wolsley.

For twelve incurved there were five entries, and after careful criticism, Mr. F. Clibborn (Mr. Crowley) was placed 1st, Mrs. Malcomson 2nd, and Dr. Garner 3rd. In the 1st, Joan d'Arc (almost perfect), Golden Empress, and Blush Queen, were particularly noticeable; and in the 2nd were Novelty, Lord Wolsley, and Blush Queen. Many of the blooms were very fine.

Next came twenty-four Japanese, and for this the competition was close between Mr. R. de la Poer, Mr. T. Phelan, and Dr. Garner, but ultimately the prizes went in the order named.

Then came the class for twelve Japanese, and this was the most closely contested at the show, 1st prize ultimately going to Mrs. Malcomson, with grand blooms of Mons. Jarin, Fanny Bouchardet, Dormillon, Val d'Andorre, and Elaine—very fine. Mr. Clibborn was 2nd, with Edwin Molyneux, Ralph Brocklebank, and Glorioso, among others. Mr. H. S. Boyd was highly commended, while two other stands were very little behind in point of merit. In the reflexed class, Mr. de la Poer had again the premier position, with some well-done blooms of the golden, white, and pink Christine, Callingtonford, and King of Crimson; Mrs. Malcomson was 2nd, and Mr. Phelan highly commended. Grandly shown by Mr. Phelan was the Poor Amy Furze. In Anemone Japanese, Mr. de la Poer once more was peerless; while in pompons Mrs. Malcomson and Mr. Boyd divided the honours in the order named.

In the incurved section the best bloom in the show was adjudged to Raymond de la Poer's Princess of Wales—a perfect bloom—Mrs. Heal almost disputing the honour in the stand. In the Japanese the premier position went by general consent to the new introduction, Ralph Brocklebank, in Mr. Clibborn's collection, next being the telling new variety Edwin Molyneux.

*The Silver Cup Competition*.—Special, value £5, given by Raymond de la Poer, Esq. This was the blue ribbon of the show, and as it entered five stands of twenty-four each, incurved and Japanese, to contain eighteen distinct varieties, by the donor, Mr. F. Clibborn, Mrs. Malcomson, Dr. Garner, and the Hon. Dudley F. Fortescue, Summerville—the cup, with 1st prize, and the 2nd and 3rd prizes going in the order named.

Fruit was shown in some considerable quantity and also miscellaneous exhibits. From "Clonmel Chronicle."

## YORK CHRYSANTHEMUM.

Nov. 14, 15, and 16.—The annual Chrysanthemum show, held under the auspices of the Ancient Society of York Florists, was opened in the Yorkshire Fine Art and Industrial Institution. Since the Society extended its enterprise to the holding of a show of Chrysanthemums in the autumn, no floral exhibition in the district, always for it excepting the Yorkshire Gala show, has so quickly achieved popularity or so well sustained its position. The Society gave this year upwards of £100 in prizes, and the premiums offered were large enough to attract the best growers of the district. This year the range of competition has been extended, several competitors from beyond the previous area having entered the lists. The entries, therefore, showed a considerable increase on any previous year's total. The nipping frost which occurred on the first night of October played havoc with all the gardens in the locality, and a great many flowers were spoiled. Notwithstanding this accident, the display was quite up to the average.

The four groups set out for competition for Mr. Alderman Rymer's prize were of a high order of merit, the foliage and blooms being arranged and mingled with good effect. The 1st prize was awarded to Mr. T. M. Weddall, of Selby; 2nd, Mr. J. T. Hingston. The smaller groups did not produce so good a competition, but they were very effective. The Chrysanthemums in pots were for the most part well grown, and bore a mass of well formed blooms; and

the best varieties were strongly represented. There was also a capital show of Palms and Dracanas, and a very pretty display of Primulas and decorative foliage plants.

Among the cut flowers the display of new Japanese Chrysanthemums shown (not for competition) by Mr. T. B. Morton, Darlington, were noticeable, the blooms being very large and perfect in form. In proximity to these were staged the collections of Chrysanthemums in the class for the ex-City Sheriff's prize. Each entry consisted of eighteen incurved and eighteen Japanese, the whole including not less than twenty-four varieties. The premier prize was awarded to Mr. W. B. Richardson, J.P., for a really grand lot, in which the only weak point was in some of the Japanese varieties. The other cut Chrysanthemums formed a splendid show.

In one of the classes for reflexed Chrysanthemums a difficulty arose, the judges considering that two of the exhibits were really Japanese, and they were therefore disqualified, but in order to make the merit of the flowers, were awarded special prizes.

A lovely lot of cut flowers were shown, and the bouquet classes were well filled. Fruit presented an exceedingly fine show, the Grapes being of remarkable quantity, size, and bloom. The Apples and Pears were of excellent quality. In these classes Mr. Goodacre, gr. to the Earl of Harrington, Elvaston Castle, had no less than eighty plates of Apples and fifty of Pears. Messrs. Backhouse & Sons, York, sent a very extensive collection of Apples, not for competition, and also some fine Dalketh Sprouts. The vegetables were good, especially the collections for which Messrs. Deverill & Co., Banbury, and Messrs. Stanley & Son, Wath-upon-Dearne, offered the prizes. The former firm had also an exhibition, not for competition, a large assortment of vegetables, of which Onions of extremely large growth were the leading feature, and for their splendid productions no less than six certificates were awarded.

We append a few of the more important prizes in the three main sections of the exhibition:—

**Cut Flowers.**—Thirty-six Chrysanthemums, eighteen incurved, not less than twelve varieties, and eighteen Japanese, not less than twelve varieties, or more than two blooms of one variety—1st, Silver Cup, value £5, given by the ex-City Sheriff (B. Border, Esq.), and £5 by the Society, W. B. Richardson, 2nd, H. J. Robinson. Twenty-four Chrysanthemums, distinct, twelve incurved, and twelve Japanese—1st, W. B. Richardson; 2nd, G. Whitehead. Twelve Chrysanthemums, incurved, distinct—1st, W. B. Richardson; 2nd, Miss Steward. Twelve Chrysanthemums, reflexed, not less than six varieties—1st, Miss Steward. Twelve Chrysanthemums, Japanese, distinct—1st, A. Milnthorpe; 2nd, T. Smith, Beverley. Six Chrysanthemums, ditto, one variety—1st, Miss Steward; 2nd, T. Smith, (Beverley). Twelve bunches of cut flowers, not less than eight varieties—1st, Mrs. Lloyd; 2nd, T. F. Wood.

**Fruits.**—Six bunches of Grapes, three varieties, two bunches of each—1st prize (Vice-President and Stewards' prize), Mr. Goodacre, gr. to the Earl of Harrington; 2nd, R. C. Neville. Two bunches of black Grapes—1st, Lord Hotham. Two bunches of white Grapes—1st, R. C. Neville. Extra for Vine in pot—Mrs. Gulch. Extra for three Pines—Sir J. W. Pease, Bart. Assortment of Apples, grown North of the Trent, correctly named—1st (given by Messrs. Backhouse & Sons, York), Mr. Goodacre; 2nd, J. W. Hutchinson. Assortment of Pears, grown North of the Trent, correctly named—£1 5s. (given by Messrs. Backhouse & Son)—1st, Mr. Goodacre.

**Vegetables.**—Collections of vegetables were shown chiefly in response to offers of prizes by Messrs. Deverill, of Banbury, Oxon.; and Messrs. C. Stanley & Son, Wath-upon-Dearne, Yorkshire. In the first-named Mr. J. Kirk was the head prize-taker, and in the second Mr. S. Hardcastle. For an exhibit consisting of nine kinds of vegetables—Society's prize—Mr. J. Whitehead was 1st; and Mr. S. Hardcastle 2nd. Beside the above large competitions there were very numerous small ones, consisting of single dishes of seasonable vegetables.

## WINCHESTER.

NOVEMBER 13 AND 14.—The Winchester Horticultural Society's show of the Chrysanthemum, held in the Guildhall on the dates named, was a very good one, notwithstanding the damaging effects of the early October frosts.

For eight specimens—a very fine class—Mrs. W. Joy, Shirley, Southampton, with plants 5 feet in diameter, profusely flowered without being too closely

trained, was easily 1st; Mr. Wills, gr. to Mrs. Pearce, Bassett, was a good 2nd. All the plants staged by growers residing within a radius of 5 miles from Winchester—a special class—showed a marked improvement upon those of last year; the best being shown by Mr. J. Kaines, The Cedars, Hyde Park Road.

Mr. G. Wareham, gr. to Mrs. E. Gunner, Heathfield, Winchester, staged the best group of Chrysanthemums, a well arranged group of plants, freely flowered.

The best miscellaneous group of plants, occupying a space 56 square feet, was that of Messrs. Jeffrey & Jones, Winchester, and consisted of Palms, Ferns, Bouvardias, and other flowering plants, put together very successfully.

**Cut Blooms.**—These formed by far the more important part of the exhibition, and the principal class was one for forty-eight blooms, half to be Japanese in not less than eighteen varieties, and the same number of incurved blooms. It was considered by some persons that the judges made a serious error in their award of 1st honours, which was given to Mr. Neville, gr. to W. Slight, Esq., Twyford, Winchester. His incurved flowers were of medium size and beautifully finished, while the blooms of Japanese were especially weak; the stand of Japanese varieties from the winner of the 2nd prize, Mr. E. Molyneux, Swanmore Park, was so much in advance of the 1st prize stand, as also was the back row of the incurved blooms, that those present able to form an opinion were unable to justify the award. Messrs. Drover & Son, nurserymen, Fareham, were 3rd.

For twenty-four blooms in not less than eighteen varieties Mr. Trinder was 1st, with good blooms in both incurved and Japanese varieties.

For twelve incurved Mr. Neville was 1st, and for twelve Japanese, distinct, Mr. Molyneux was 1st, both exhibitors staging well.

Mr. Neville staged the best twelve reflexed and twelve Anemones.

Mr. Shenton (gr. Mr. T. Annells), Twyford, Winchester, staged the best six incurved, neat blooms, and the best twelve pompons, distinct, in bunches of three.

**Fruit.**—The exhibits in point of quality were in point of numbers more extensive than usual. The best three bunches of Grapes, distinct varieties, were shown by Mr. C. Warder, gr. to Sir F. Bathurst, Clarendon Park, Salisbury, and were good examples of Alicante, Gros Colmar, and Muscat of Alexandria. Mr. Molyneux, gr. to W. H. Myers, Esq., Swanmore Park, Bishop's Waltham, was a close 2nd.

For two bunches of Grapes, black varieties, the two last exhibitors changed places. Mr. Molyneux staged Alicante in good condition.

Mr. Warden took 1st honours for two bunches of white Grapes with Muscat of Alexandria, followed by Mr. Molyneux.

Mr. G. Best, gr. to C. W. Chute, Esq., The Vyne, Basingstoke, staged the best dessert Apples in three varieties, well coloured medium-sized examples; and Mr. Trinder, gr. to Sir H. St. Mildmay, Dogmersfield Park, the best culinary varieties, and Pears.

The arrangements by Mr. C. Shenton, the Hon. Secretary, gave complete satisfaction.

## KENT COUNTY.

NOVEMBER 14 AND 15.—This Society made an excellent commencement at Blackheath, and thanks are due to the Honorary Secretary, Mr. Needs, for its inauguration this year.

For a group Mr. J. Hudd, gr. to F. W. Prior, Esq., Blackheath, easily secured 1st with a tasteful arrangement. Messrs. Dobson, J. Hudd, and Rhoden, were also awarded prizes, in the order of their names, for groups.

Japanese cut blooms were keenly contested by some of the leading growers. Mr. Packman, gr. to E. E. Shea, Esq., Fooks Cray, won 1st with twenty-four Japanese, showing magnificent blooms, Mr. R. Leadbetter, gr. to A. G. Hubbuck, Esq., Chislehurst, being a good 2nd. Mr. W. Packman led again for eighteen Japanese.

In the open class for twelve Japanese, Mr. Pannell, Ashley House Gardens, Caterham, was 1st with fine blooms of popular varieties; Mr. H. Shoemith, gr. to M. Hodgson, Esq., was a very close 2nd.

For six blooms of one white Japanese variety, Mr. Packman again secured the premier place with splendid blooms of Avalanche; and in a corresponding class for coloured Japanese flowers he again led with splendid blooms of Mr. Ralph Brocklebank.

In the gentlemen's gardeners' class, Mr. J. Hudd was the chief winner.

In the amateur classes, Mr. Briscoe Ironside, Fooks Cray, and Messrs. Donet, Bannister, Shepley, and Fielding all contributed good stands of well-grown blooms, particularly the first-named.

Incurved blooms were equally well shown. Mr. H. Shoemith worthily secured the post of honour for eighteen varieties, having superb blooms of the usual exhibition varieties; Mr. Packman was 2nd with smaller but neat blooms.

In the open class for twelve, Mr. J. Pannell led with finely-finished blooms.

Mr. H. Shoemith was again 1st in the gentlemen's gardeners' class for twelve incurved; and he led also for six blooms of one variety, with Lord Alcester, in prime condition.

In the amateur classes Mr. Shepley and Mr. Donet staged some good blooms.

For Japanese Anemones, Mr. F. Moore, gr. to J. W. Rickersgill, Esq., Blendon Hall, Bexley, gained the chief award, having some nice blooms of J. Thorpe Junior, Sunflower, Louis Bonamy, and Laing's Anemone. Mr. F. Moore again led with pompons, followed by Messrs. Davis & Jones, Camberwell.

The special prizes were keenly contested, Mr. W. Packman taking 1st for the President's prize for twenty-four blooms of Japanese, reflexed and incurved in equal numbers, staging some splendid blooms. Mr. F. Moore was a capital 2nd—a particularly fine bloom of Stanstead White was on his boards.

**Miscellaneous.**—Messrs. Davis & Jones, of Camberwell; and Messrs. John Laing & Sons, of Forest Hill, exhibited, not for competition, groups of Chrysanthemums effectively arranged; and Mr. Wickham Jones, Fooks Cray, showed a few stands of good cut blooms. Messrs. Davis & Jones staged also a few stands of Miss Annie Lowe, Violet Tomlin, and Mrs. Walters. Messrs. John Laing & Sons showed, not for competition, a large exhibit of the best sorts of Apples.

## MARKET HARBOUROUGH.

The district Chrysanthemum Society of this town held their Annual Show on Wednesday and Thursday, November 14 and 15, and the committee is to be congratulated on the success which has again attended them in bringing together so capital an exhibition.

The specimen plants in the incurved and Japanese varieties were very meritorious, and were shown in great numbers and of fine quality.

The majority of the prizes for plants were taken by S. Symington, Esq., Brookland House, Market Harborough (gr. Mr. H. Dunkley). For a group, Messrs. Plovmann & Son were awarded premier honours. R. H. P. Hutchinson, Esq., Husbands Bosworth (gr. W. W. Rainbow), was 2nd in that class, and G. H. K. Fisher, Esq., Market Harborough (gr. Mr. W. Norman), 3rd. In cut cut flowers, S. Symington, Esq. (gr. Mr. J. Clarke), G. L. Watson, Esq., Lockingham Castle (gr. Mr. H. Watt), and Sir F. F. Turville, K.C.M.G. (gr. Mr. W. Duncan), were the most successful exhibitors.

In the exhibits of amateurs an improvement on previous shows was noted; and the most admired were the plants of Mr. S. Branton and the groups of Messrs. Bott, Branton, and Dalby.

## EALING CHRYSANTHEMUM SHOW.

This annual display of the favourite winter flower was held at Ealing on the 14th inst., but like to so many other suburban displays, had to suffer in attractiveness from the lack of good plants, owing to the October frosts. All the same, the Lyric Hall, in which the show was held, made a pretty picture. One chief decorative group was shown by Mr. Chadwick, gr. to E. M. Nelson, Esq., Hanger Hill, but was not for competition; it was very gay, and effectively arranged.

Mr. Wigmore, gr. to F. Hicks, Esq., and Mr. Viner, gr. to R. D. Dawes, Esq., had the best large competitive groups; and Mr. A. H. Johnson the best smaller group.

The cut flower classes were fairly well contested, some of the blooms being of great excellence. Mr. Hudson, gr. to A. H. Atkinson, Esq., M.P., Gunnersbury House, showed a lot of very fine blooms, not for competition, as also did Mr. Chadwick. Miss H. B. Smith arranged a lovely basket of Chrysanthemums, and some beautiful bouquets and sprays for

ladies. The ladies' table stands and bouquets were a very gay feature. The premier flowers of the show, taking the National Society's Bronze Medals, both shown by Mr. Owen, of Ealing, were Boule d'Or and White Queen of England.

Fruits were in good form. Messrs. Lee & Sons showed a fine collection of Apples and Pears grown at their Ealing nursery. The culinary and dessert Apples in competition were exceedingly good, Potts' Seedling, Emperor Alexander, Peasgood's Nonsuch, and Wellington being amongst the finest of the former, and Blenheim Orange, King of the Pippins, and Cox's Orange Pippin of the latter. Pears also were very good, and generally well preserved.

Potatoes were in excellent form also, whilst the competition in the vegetable classes was remarkable, no less than twelve collections of six kinds being staged in the open class, Mr. Chadwick coming 1st. The cottagers' exhibits in this section were first-rate, and hard to excel this season.

The classes for cooked Potatoes, served hot, were well contested, the 1st prize in each case falling to Mr. E. Cachett, of Acton, a railway signalman, whose samples were of the best description.

### WATFORD CHRYSANTHEMUM.

NOVEMBER 13 AND 14.—The fourth annual exhibition of Chrysanthemums at the Agricultural Hall was by far the best yet held by the Society, the entries being larger, and the exhibits more meritorious than previously, amongst the competitors being many who had exhibited at the National in the previous week. The central group of plants in the hall came from Lord Clarendon's garden, and were not in the competition. The group was arranged skilfully and with much taste by Mr. Myers.

In the group class the 1st prize was awarded to Mr. Dinsmore, gr. to T. F. Blackwell, Esq., for a very nice group of flowering plants, Orchids, and Ferns; the 2nd and 3rd being awarded to Mr. Cox, gr. to Mrs. Brown, and to Mr. Condie, gr. to S. Blackwell, Esq., in the order named. In cut flowers the competition was severe, the entries numbering nearly 200, and our remarks must necessarily be limited to the open classes.

*Twenty-four Japanese.*—The flowers were superb, as is shown by the fact, that the winning lot, that of Mr. Edwin Beckett, gr. to H. H. Gibbs, Esq., was awarded also the prize for the exhibit in the show, and one of his blooms, Album fimbriato, was adjudged the premier flower amongst the Japanese. Mr. Beckett's other fine blooms were S. Oliver, Sunflower, Madame C. Audiguer, and E. Molyneux. Second honours were taken by Mr. Cox, gr. to J. Trotter, Esq.

*Twenty-four incurved.*—Mr. Beckett was again 1st; and secured the prize for the best incurved flower in the show with a fine example of Princess of Wales. Mr. E. Sanderson, President of the "National," was 2nd with a remarkably fine stand of flowers of high finish; and was 2nd to Mr. Beckett's only in point of size.

*Twelve incurved.*—Mr. E. Sanderson was 1st with a fine lot of the leading varieties; 2nd, Mr. Mundell, gr. to Lord Ebury.

*Twelve Japanese.*—1st, Mrs. Brightmen; 2nd, Mr. Kirby, gr. to Sir A. Charles.

*Six incurved, one variety.*—A keen contest occurred in this class, the blooms being in all cases well set-up, and with a degree of finish that will be explained by reference to the names of the winners. 1st, Mr. Beckett, with Princess of Wales; 2nd, Mr. Sanderson with Princess of Teck; and 3rd, Mr. Mundell with Golden Empress. In the same section for distinct Japanese, Mr. Beckett again won 1st place with a stand of the pure white Avalanche; and Mr. Henty 2nd.

In the amateurs' classes a keen competition took place in cut blooms, Mr. R. Bradberry a successful exhibitor at the Aquarium, taking 1st honours in incurved, and Mr. Lansley and Mr. Surman being equally successful with Japanese.

*Plants.*—Mr. Kirby, gr. to Sir A. Charles secured 1st place with a group of plants well flowered, but rather too tall for good effect.

*Fruit.*—A fine collection, not for competition, was shown by Messrs. Lane. In the competing classes Messrs. Beckett, Brown, and Barnes were the chief prize-takers.

*Vegetables.*—These were well shown in collections. Mr. Beckett again was foremost, with Mr. Henty 2nd.

Table plants, Cyclamens and Primulas, were shown. Some Bouvardias and Pernettyas, not for competition were exhibited by Messrs. Cutbush, and a group

of mixed plants by Mr. Darby, florist, of Watford. Table decorations, floral devices, and berried plants, all helped to make up a really first-class show.

### WESTON-SUPER-MARE.

Nov. 14.—This was the fourth annual exhibition held in the Victoria Hall. It is gratifying to see the quality of the exhibits improve each year, still there is room for improvement.

For six Chrysanthemums, large flowered, distinct varieties (Japanese excluded) Mr. Brooks led, with nice healthy and well trained plants.

Mr. Holland, gr. to W. Ash, Esq., had the best six Japanese, distinct, with very nice specimens, well grown fine and fresh flowers of Rendatler, Source d'Or, Margot.

Mr. Holland led with three standards, any variety, having very nicely grown specimens and well flowered.

For a group of Chrysanthemums, arranged for effect in a space 10 by 5 feet, not much taste was displayed in the arrangement. Mr. W. Brook was 1st, having a splendid lot of plants in great variety.

For six stove or greenhouse plants Mr. Brooks, with *Lantana borbonica*, *Seaforthia elegans*, *Phoenix dactylifera*, &c., was 1st.

Cut flowers were shown very well, with good competition in most of the classes. Mr. Miller (Clifton) was placed 1st for twenty-four large flowering, Japanese excluded, with popular varieties; and for twelve ditto Mr. Holland led.

Mr. Miller came to the front with a capital stand in the class for twenty-four Japanese. E. Molyneux, and Soleil Levant were good. Mr. Dufferin had the best twelve ditto.

For two bunches of black Grapes Mr. Dufferin led with excellent bunches of Black Alicante; and Mr. Coates for white with Muscat of Alexandria.

### READING CHRYSANTHEMUM.

As is usual this Society held a fine and extensive exhibition in the Municipal Buildings on the 15th inst., both Town Halls being utilised for the purpose, and there were quite enough exhibits to occupy all available space. Some plants of Crotons of large size and fine colour, staged by Mr. Lees, gr. to Mrs. Marsland, White Knights, Reading, greatly helped the appearance of the halls.

Groups of Chrysanthemums arranged for effect.—There were nine of these placed round the sides of the old Town Hall, and they were a striking feature. The appearance of these groups would be greatly enhanced if some low plants were employed to cover the nakedness of the pots and stems of the Chrysanthemums. The best came from Mr. H. Perkins, gr. to the Right Hon. W. H. Smith, Greenlands, Henley-on-Thames, having well grown plants on single stems of incurved and Japanese varieties—the flowers large and well finished, and nicely fresh. Mr. Turton, gr. to John Hargreaves, Esq., Maiden Erlegh, Reading, who had strongly grown plants carrying large flowers, but there was a nakedness about the plants that greatly detracted from their appearance. Mr. Hawkins, gr. to W. Crosslade, Esq., Earley, was 3rd; and several other prizes were awarded.

*Specimen Plants.*—The best six, Japanese varieties excluded, came from Mr. Surman, gr. to C. W. Witherington, Esq., fairly well grown and bloomed, the Rundle type being conspicuous. Mr. Booker, gr. to R. Tompkins, Esq., Reading, had the best three, having well-grown and bloomed specimens of Mrs. G. Rundle, Mrs. Dixon, and Emperor of China. There was but one collection of six specimen Japanese, Mr. Surman being 1st with excellent plants, large, well grown, and finely flowered, consisting of Mille Lacroix, Madame Bertier Rendatler, Bouquet Fair, Red Dragon, James Salter, and Lady Selborne. Mr. Powell, gr. to G. Gilligan, Esq., Reading, had the three best specimens, showing in good condition, Elaine, Val d'Andorre, and Red Dragon; Mr. Franklin, gr. to F. Lucas, Esq., Reading, was a good 2nd.

A very good feature was found in a class for six short table or window or table plants, and very charming they were—small, well-grown and bloomed. Mr. Surman was 1st—Mrs. Dixon, Mrs. Geo. Rundle, James Salter, Lady Selborne, Madame Bertier Rendatler, and Bouquet Tait; Mr. Franklin was 2nd, also with very nice small plants.

Mr. Armitage, gr. to N. Clarke, Esq., Reading, had the best three standards, with shield-shaped

heads, very formal and ugly in appearance; Mr. Franklin being 2nd.

The best standard was King of Crimson, from Mr. W. T. Abern, nurseryman, Tilehurst, with King of Crimson; Mr. J. Leslie, Reading, being 2nd, with Mrs. G. Rundle.

The three best specimen pompon varieties came from Mr. Franklin—well grown and bloomed plants of Sour Maline, Rose Trevenna, and President Decaisse; Mr. Surman was 2nd.

Pompon varieties as table plants were a good feature also, Mr. Franklin being again 1st, and Mr. Surman 2nd.

Mr. Booker had the best standard, Mr. W. T. Abern being 2nd.

*Cut Blooms.*—Some excellent flowers were shown in the class for eighteen incurved varieties, Mr. Allen, gr. to Sir G. Russell, Swallowfield Park, Reading, being 1st with finely-finished blooms of Lord Alcester, Alfred Salter, Jeanne d'Arc, Lord Wolsley, Princess Alexandra, Jardin des Plantes, Golden Empress, Prince Alfred, Lord Eversley, Queen of England, Princess Teck, Cherub, Bronze Jardin des Plantes, Empress Eugénie, Bronze Queen, Emily Dale, and Barbara. 2nd, Mr. Neville, gr. to F. W. Flight, Esq., Twyford, Hants, having a good lot of blooms also.

The best twelve varieties, which included flowers already named, came from Mr. Brooks, gr. to H. A. Simonds, Esq., Andover, Mr. Basket, gr. to W. J. Palmer, Esq., Reading, being 2nd.

Mr. Allen had the best twelve reflexed large flowers, a very fine lot indeed, including Alma, Cloth of Gold, Pink Christine, Cullingfordi, Mdlle. Tezier, Amy Furze, Golden Christine, Pink Christine, and King of Crimson. 2nd, Mr. Brooks.

Standards of twelve Japanese varieties were remarkably fine, the best coming from Mr. Lane, gr. to Miss Bunning Smith, Ascot, who had Ed. Molyneux, Mdlle. B. Piguy, Val d'Andorre, Soleil Levant, Madame J. Laing, Criterion, Belle Paule, Ralph Brocklebank, Jeanne Delaux, Thunberg, Sarah Owen, and Avalanche. 2nd, F. W. Flight, Esq. Mr. Basket had the twelve best Anemone-flowered, the varieties being Lady Margaret, Minnie Chate, Madame Thérèse, Madame Clos, Fleur de Marie, Marguerite Solville, Bacchus, Sour Dorothy Souille, and Marguerite Villageoise; 2nd, Mr. Lees, gr. to Mrs. Marsland, The Wilderness, Reading.

Standards of twelve blooms shown with 9 inches of stem and foliage were a good feature, the flowers very fine. Mr. Allen was 1st with Mdlle. M. J. Piguy, Lord Alcester, Lord Wolsley, Thunberg, E. Molyneux, Empress of India, Jeanne Delaux, Madame J. Laing, and Golden Empress, the mixture of Japanese and incurved varieties being very effective.

Mr. Surman was the only exhibitor of six bunches of pompon varieties, having President, Adele Prisetie, White Trevenna, St. Michael, Sour Melaine, and Rose Trevenna.

*Table Decorations.*—These are always a remarkably good feature at Reading. Mr. W. T. Abern had the best table vase of Chysanthemums, Mr. Brooks being 2nd. The best large hall vase of Chysanthemums—a very fine feature indeed—came also from Mr. Abern; Mr. Brooks being again 2nd. Miss Phillips, of Reading, a well known decorator, had the best stand of cut flowers and foliage; Mr. House, gr. to J. O. Taylor, Esq., Reading, being 2nd. The best stand of autumn flowers, leaves, and berries was a charmingly arranged basket from Miss L. Phillips, of Reading; Mr. Brooker being 2nd. Mr. Abern had the best vase of everlasting, Mr. Dockerill, gr. to G. W. Palmer, Esq., Reading, being 2nd.

*Miscellaneous Plants.*—These included subjects for table decoration. Berried plants: Mr. Dockerill was 1st with two admirable specimens of *Rivina humilis*. Zonal Pelargoniums: Mr. Basket showed three finely grown and flowered specimens. Double and Single Chinese Primroses: The Reading strains were to the fore in both classes. Poinsettias, Violets, Capicums, &c. A magnificent specimen of *Eucharis amazonica* came from Mr. Butcher, gr. to G. Palmer, Esq., Reading, well grown and bloomed; Mr. Irvine, gr. to H. Ackroyd, Esq., Elmwood, being 2nd with a very fine plant also.

*Orchids.*—Several collections of three plants competed; Mr. Pound, gr. to G. May, Esq., Caversham, Reading, being a good 1st with excellent pieces of *Vanda cœrulea*, *V. tricolor*, and *Oncidium Rogersii*. Mr. Woolford, gr. to W. A. Palmer, Esq., Reading, came 2nd with *Cypripedium Spicerianum*, *C. insignes*, and *Dendrobium Deareii*.

*Fruit.*—A very good exhibition resulted, the

season considered. The two best bunches of Black Alicante came from Mr. Jennings, Forest Lodge, Farnborough, good-sized and well-coloured; Mr. Cooper, Sunninghill, being 2nd. Mr. Ashman, gr. to C. T. D. Crews, Esq., Sunninghill, had the best two bunches of Gros Colmar, very fine and well-coloured; Mr. Cooper being 2nd, with good examples also. The best two bunches of any other black grape were Madresfield Court, fine in colour but somewhat straggling in bunch, from Mr. Lees, the Wilderness Gardens. Mr. Piston, gr. to the Hon. C. S. Irby, Taplow, had Gros Maroc, well finished. Mr. Dockerill had the best two bunches of White Muscat. Mr. Turton was 1st with two bunches of any other white, having excellent Trebbiano, large in bunch and fine in quality.

**Other fruits.**—Mr. Perkins, of Greenlands, was the only exhibitor of six dishes of fruit, having good White Muscat and Alnwick Seedling Grapes, Cox's Orange Pippin Apples, Forelle Pears, Melon, and Bananas. Mr. Turton had the best six dishes of Dessert Apples, showing in good form; 2nd, Mr. Paxton, with a good lot also. Mr. Perkins had the best dish of Cox's Orange Pippin, large and fine. Mr. Turton had the best six dishes of Culinary Apples. Mr. Irvine had the best dish of Golden Noble. Mr. Turton had the best four dishes of dessert Pears; Mr. Woolford was 2nd. Some good Cucumbers, Tomatoes, and Mushrooms were also shown.

**Miscellaneous Exhibits.**—Mr. R. Owens, nurseryman, Maidenhead, had a stand of cut blooms of Chrysanthemums, including such new varieties as fimbriatum, blinsh, awarded a First-class Certificate of Merit; John Thorpe, dark cerise; and George Daniels, light pink, broad in the petal, but wanting in substance.

Mr. J. Watkins, Pomona Farm, Withington, near Hereford, had a fine collection of seventy-five dishes of Apples, many of the sorts being brilliantly coloured.

## WILTS HORTICULTURAL.

Nov. 15 and 16.—The third annual Chrysanthemum exhibition was held in the Salisbury Market House. The show, taken altogether, was an excellent one, but, unfortunately for the Society, the weather was very unpropitious on both days.

**Pot Plants.**—For the best group of Chrysanthemums, arranged for effect in a semi-circle (space not to exceed 10 feet in diameter), a 10 guinea cup and a small money prize was given. This was well won by Mr. Brown, Portland Place, Salisbury; Mr. Chalk, gr. to G. Read, Esq., West Wood, Salisbury, was 2nd. Mr. Brown was also 1st, for a very tastefully arranged group of miscellaneous plants. It consisted of Palms, Crotons, Dracenas, Eucharis amazonica, Cyrtopodiums, and a nice piece of Lælia anceps, &c., edged with small plants of Pteris cretica, albo-lineata. Mr. Carry, gr. to Col. Pepper, Milford Hill, Salisbury, was 2nd.

For a group of Chrysanthemums arranged in a semi-circle, 8 feet in diameter, open only to those who do not keep a regular gardener—1st prize, a challenge cup, value 5 guineas, and a small money prize—Mr. Charles Haskins, Poultry Cross, Salisbury, with a very creditable group of well-grown plants, tastefully arranged.

Mr. Brown had the best six specimen plants of Chrysanthemums, and Mr. Haskins the best four, both showing creditably grown plants. Mr. Frank Pearce, Salisbury, had the best trained specimen plant, with Elaine. Mr. Brown had the best two flowering plants (not Chrysanthemums), showing well-flowered plants of *Oncidium ornithorhynchum*, and a standard Epiphyllum truncatum, supporting a neat head of very bright flowers.

**Cut Flowers.**—For twenty-four blooms the 1st prize (a 10 guinea Cup and £1), went to Mr. H. W. Ward, gr. to the Earl of Radnor, Longford Castle, Salisbury, for a solid and fresh lot of blooms, of which Boule d'Or, Thunberg, Mdlle. Lacroix, Duchess of Albany, Empress of India, Lord Alcester, and Alfred Salter were the best. Mr. Ingfield, gr. to Sir J. W. Keith, Bart., Tedworth House, Marlborough, was a very close 2nd, showing, among others, grand blooms of Mons. A. Elliott, Baron de Freilly, Bronze Queen, and Jeanne d'Arc. Mr. Whit, Cornistiles, Twyford, Winchester, was 3rd. Four stands were staged.

A 5 guinea Cup and 10s. as 1st prize for eighteen blooms (open only to amateurs), went to Mr. Annals, gr. to Chaloner Shenton, Esq., The Glen, Golden Common, Winchester, for a meritorious lot of blooms, his best being Edwin Molyneux, Glorio-

sum, Baron de Prailly, Madame Andguier, and Lord Alcester; Mr. C. Haskins was a good 2nd.

Among seven good stands of twelve, incurred varieties, Mr. Ingfield led the way with a dozen large solid blooms, Lord Wolsely, Golden Empress, Queen of England, and Jardin des Plantes, being his best blooms, Mr. Flight following closely.

Mr. Ingfield was again 1st for a like number of Japanese, with a grand lot of blooms, Baron de Prailly, Ralph Brocklebank, Meg Merrilies, and Duchess of Albany, being his best; Mr. Ward was a close 2nd: eight stands were put up.

Mr. Ward was 1st in a good competition for twelve reflexed, with even, fresh blooms—Cloth of Gold (very deep), Pink Christine, King of Crimsons, and Cullingfordii, being the most noticeable; Mr. Ingfield was a good 2nd.

Mr. Flight was 1st for twelve Anemone-flowered varieties, showing large, even blooms of leading varieties. The ladies' classes were well represented.

**Fruit.**—Mr. Ward was 1st, for a collection of fruit, six kinds, showing Gros Guillaume and Trebbiano Grapes—the bunches of the latter being fine—Cayenne Pine, Hero of Lockinge Melon, Gien Morceau, Pears, and Ribston Apples. Mr. Warden was a very close 2nd, showing splendidly coloured Alicante and Muscat of Alexandria Grapes as his best dishes. Mr. Warden was a good 1st for White Muscats, Black Alicantes, and with Gros Colmar. In the class for any other black Grape, Mr. Ward was 1st. In the class for any other white Grape, with good examples of Trebbiano. Mr. W. Scott, Exeter, was 1st for three dishes of dessert Apples, with good examples. Mr. Smith, gr. to the Bishop of Salisbury, the Palace, Salisbury, was a good 1st for a like number of kitchen varieties; and Mr. R. West, Northlands, Salisbury, had the best three dishes of Pears.

**Non-competing Exhibits.**—Mr. Ward put up three nice Queen Pine-apples, and two stands of Chrysanthemums; and the Messrs. Keynes, Williams & Co. arranged two pretty groups of miscellaneous plants.

## IPSWICH AND EAST OF ENGLAND.

NOVEMBER 15 AND 16.—This was held in the Corn Exchange, but though good, was not characterised by the keen competition in the cut flower department of former years, as none of the professional London growers put in an appearance. The Rev. H. Berners, of Rose fame, was to the fore in many of the classes, and this gentleman took the National Chrysanthemum Society's Silver Medal for the best bloom in the Show; this was named Princess Imperial, but it is an open question whether it is really distinct from Lord Alcester. Be this as it may, the bloom referred to was exceptionally fine, and well deserved the award.

In the open class for twenty-four, twelve incurred and twelve Japanese, Mr. John Rolfe, gr. to Mrs. Rendale, of Hill House, Lawford, was 1st; the 2nd and 3rd prizes falling to Mr. R. Burrell and Mr. Miller.

In the amateurs' class for the same number of flowers, Mr. H. Lister, gr. to Lord Broke, of Easton's Lodge, Dunmow, was a good 1st; Mr. Palmer, gr. to T. H. Powell, Esq., of Drinkstone, coming in 2nd.

For the best twelve incurred in the open class, the Rev. H. A. Berners, of Harkstead, was 1st. In the open class for twelve Japanese, the Rev. H. C. Hales, of Lawford Place, came in 1st. In the amateurs' class for twelve Japanese, Mr. Palmer took 1st. For the best twelve incurred, Mr. Lester was 1st. The most noteworthy blooms in all these stands were—Criteria (very fine), Mrs. Wright, Mons. J. Laing, Mons. H. Payne, Meg Merrilies, Prince of Wales, Empress of India, Golden Empress, Lord Alcester, M. Marrouch, Jeanne Delaux, Mdlle. Lacroix, Baron de Prailly, Bellegarde.

For twenty pot plants, the space allowed for grouping was 40 feet, and the competition was strong, but the judges looked less to size of blooms than to the dwarfness and compactness of the specimens, else the 3rd lot would have stood 1st. The 1st place fell to Mr. A. Dumble, gr. to R. M. Miller, Esq., the 2nd to Mr. Holdens, gr. to C. A. D. Malford, Esq., of West Lodge, Bergholt, and the 3rd to Mr. Jordan, gr. to the Rev. H. A. Berners, of Harkstead.

In the smaller classes, Mr. Chenery, gr. to Mrs. Booth, carried nearly all before him; and quite a feature in the show was the group contributed by persons residing in the borough at a rental not above £12.

In the fruit department, for the best collection of six dishes, Pines excluded, there were seven exhibits,

the 1st prize being taken by Mr. Rogers, gr. to Lord Rendlesham, the 2nd by Mr. Sheppard, gr. to Captain Berners, of Woolverston Park.

For three bunches of Alicante Grapes, Mr. Chenery was 1st.

In the class for black of any other variety, Mr. McMillan was placed 1st; Mr. Tebenham, gr. to Lady North, coming 1st for Muscats.

In the class for white, of any other kind, Mr. Sheppard was 1st, with Golden Queen.

Pears and Apples were remarkably fine for the seasons, and Mr. Sheppard scored an easy victory in the two classes, for six of each and single do. of twelve: 1st for dessert Apples, Mr. Andrews.

The collections of vegetables were numerous and fine, and in this class Mr. Andrews was placed 1st; Mr. Cresswell, gr. to G. W. Charters, Esq., of Stoke Park, 2nd; but in the classes for Potatoes, the latter carried off both the premier awards,

## TIVERTON.

NOVEMBER 15.—The annual exhibit was held in the Drill Hall; an excellent lot of groups and trained plants was staged. The Apples and Pears were also of very fine quality.

Mr. Lake, gr. to E. Moyle, Esq., was placed 1st, with a group of Chrysanthemums arranged for effect, taking the Silver Medal of the National Society.

For thirty-six cut blooms of Chrysanthemums, eighteen incurred and eighteen Japanese, Mr. Barnes led, with a magnificent lot of Japanese; 2nd, Mr. Sparks, whose incurred were his best. Mr. Barnes also took several other prizes.

The principal prize-takers for fruit were:—Mr. James, gr. to Sir J. Walrod, Bart.; Mr. Peebles, Mr. H. Salmon, gr. to W. Dunsford, Esq.; Mr. J. Mogridge, gr. to Mrs. Ord; and Mr. Sparks; and in this division Apples and Pears were fine.

Messrs. Veitch & Sons, of Exeter, staged a collection of excellent and clean fruit; Mr. C. Slater, sent a fine lot; Messrs. Lumcombe, Pince & Co., also put up a collection of merit; and Messrs. Jarman & Co., of Chard, also exhibited.

## CHISWICK HORTICULTURAL.

NOVEMBER 16.—This was a very pretty show, of moderate dimensions; the exhibits were of very fine quality. Mr. E. Coombes, Kingston, was the leading exhibitor in the chief class, for twenty-four cut blooms of Chrysanthemums, twelve each of Japanese and incurred; the incurred blooms were of very fine quality, and decidedly superior to his Japanese, which, however, were large and bright; Lord Alcester, Jardin des Plantes, and Queen of England, with Duchess of Albany, Boule d'Or, and Madame J. Laing were the best. Mr. C. J. Waite, the Glenhurst Gardens, Esher, followed, with a very creditable lot, strong in Japanese.

The last named exhibitor swept the board completely in the fruit and vegetable classes, showing strongly in many cases, and well in all; his Carrots in competition for Messrs. Sutton's prizes, were magnificent, clean, and of good even form; and his Black Alicante Grapes were also fine. He also led for Chinese Primulas, for twelve reflexed Chrysanthemum blooms, and for Sutton's prize for Primulas.

Mr. Coombes had the best stand of Pompons, and was a capital 2nd with large blooms in the class for twelve incurred blooms, following Mr. Sanderson, Esq., St. Mary Road, Harefield, N.W., who had remarkably even well coloured blooms of medium size, of which Mrs. Brunlees, Hero of Stoke Newington, and Lord Alcester were conspicuous. The same exhibitor was also leader in the class for six blooms of one variety, incurred, showing Hero of Stoke Newington, in neat, solid specimens; and he again led in the amateurs' class for six distinct incurred.

Mr. Munro, gr. to E. C. Paul, Twickenham, was the leading exhibitor of twelve Japanese blooms, distinct, and a fine lot he staged, Comte de Germiny, Boule d'Or, and Glorioso, being conspicuous examples.

Messrs. W. Fromow & Sons, nurserymen, Chiswick, staged the best six blooms of one variety of Japanese, with Mdlle. Lacroix, clean, and of fair size.

A pretty lot single-flowered were sent by Mr. Chadwick, gr. to E. M. Nelson, Esq., Ealing, which secured the 1st place in that class.

E. H. Douet, Esq., Teddington, was the leading

exhibitor of Japanese and pompon blooms in the amateur section, showing very creditably.

Messrs. Fromow & Sons had the leading group of Chrysanthemums; and Mr. F. Mears, gr. to J. T. Thornycroft, Esq., Chiswick, was 2nd, both exhibitors showing strong plants with bright flowers.

Mr. A. Wright, gr. to E. H. Watts, Esq., Devonhurst, Chiswick, showed specimen plants.

Non-competing Exhibits were fairly numerous. The Royal Horticultural Society had three baskets of very excellent Grapes; they were Black Alicante, Alnwick Seedling, and Gros Colmar. Mr. May, gr. to the Marquis of Bute, Chiswick House, had an extensive group of Chrysanthemums. Messrs. C. Lee & Son, Hammersmith, had a varied collection of Apples, including the most popular varieties. Orchids were sent by Mr. Cowley, gr. to F. G. Tautz, Esq., Shepherd's Bush, W., and by Messrs. Fromow, who had a number of plants of *Sonchella Hendersoni*, and *Odontoglossum grande* was fine. Crotons were shown by the same firm.

## PEMBROKESHIRE.

NOVEMBER 15.—This show was held in the Market House, Pembroke, and a show of good general quality was got together, the exhibits being very numerous. Mr. W. B. Fisher, gr. to the Earl of Cawdor, Stackpole Court, Pembroke, carried off the principal awards in the open classes for Chrysanthemums, and Messrs. Crichton and French were also successful. Mr. J. Dumble, gr. to Sir E. G. Phillips, Bart., Pembroke, had the best bloom, in Lord Alcester; and he also took many other honours, and the National Chrysanthemum Society's Medals were awarded to Mr. Fisher and Mr. F. J. Skyrme, Monkton, the last named being the most successful amateur; Mr. T. Crofton, Monkton, also showing well. In the fruit and vegetable section Messrs. Clayton, Williams, Crichton, and Croft were the leaders.

## THE PROVINCIAL SHOW OF THE NATIONAL CHRYSANTHEMUM.

NOVEMBER 16 AND 17.—This exhibition took place in conjunction with the fourth annual show of the Sheffield and West Riding Chrysanthemum Society, and the Sheffield and Hallamshire Gardeners' Mutual Improvement Society, and was held in the spacious Corn Exchange upon the above dates. We must confess to a feeling of disappointment with the exhibition which had but few features of a high-class character, the plants being of a poor description generally. The Hallamshire growers say, and with a great deal of truth, that they have had to contend with a remarkably untoward season; that frost, wet, and the absence of sunshine, had greatly affected the plants, and that not a few that had expected to exhibit found themselves unable to do so. As an exhibition it fell much below Reading, for instance; but this is, perhaps, hardly a fair comparison. But all that could have been done was doubtless done to make the exhibition worthy of its name, only one Southern grower competed, which was a disappointment.

In the classes for thirty-six blooms of incurved varieties, twenty-four, twelve, and six, there was not a single exhibitor; and there was a similar absence in the classes for twenty-four Japanese, six Japanese, twelve reflexed, twelve reflexed Japanese, twelve large Anemone, twelve large Japanese Anemone, twelve pompons, and twelve Anemone pompons. It will thus be seen that in the very classes in which a large display was reasonably looked for there was the entire absence of any interest. Perhaps the Southern growers were somewhat afraid of meeting the North, and *vice versa*. The arrangements were, on the whole, good; but it will be found necessary in the future, if other provincial shows are held, that the executive in London have a fuller knowledge of matters than appears to be the case at Sheffield.

Plants.—Groups of Chrysanthemums arranged for effect. That from Mr. J. Redmill, gr. to J. G. Lowwood, Esq., Glossop Road, comprising fairly grown and bloomed plants, edged with Palms, &c. Mr. B. T. Bromhead, Bromhall Park, was the only exhibitor of six trained specimens.

With three plants, Mrs. H. Wilson Westbrook, was 1st; and Mr. Redmill 2nd.

Mr. P. B. Bromhead had the best three pompons, Mrs. Wilson being 2nd; but in the next class, for one specimen, the positions were reversed.

In the class for a group of miscellaneous plants there were several entries, and they came in very

useful as relieving the dead cold appearance of the Exchange walls. The best, a tastefully arranged one came from Mr. W. Collier, gr. to John Eaton, Esq., Sharrow Bank, Helms, Crotons, Dracenas, Bouvardias, Chrysanthemums and Gloxinias being mingled with excellent effect; Mrs. H. Wilson was a good 2nd.

There were also plant classes, the competition open to growers residing within a radius of 20 miles of Sheffield parish church; and, wide as the district is, the plants produced were poor. Here, as before, the honours were divided between Messrs. Lowwood and Bromhead.

Miscellaneous Plants.—The best twenty pots of British Ferns came from Mr. J. Eadon, Carnfield Road; Mr. J. Newsham, Meersbrook, being 2nd; the latter the best three Filmy Ferns, having good examples of *Trichomanes radicans*, *Hymenophyllum tunbridgeense*, and *H. Wilsoni*. Mr. Bromhead had the best six exotic Ferns; Mr. J. Eadon being 2nd. Chinese Primroses were of indifferent quality. Mrs. H. Wilson had the best six, double and single; Mr. R. F. Mosely being 2nd. Mr. John Spaight, gr. to Mrs. Fawcett, Clark House, Sheffield, had the best four pots of *Bombay Hyacinths*; Mr. John Taylor, gr. to Thomas Eyre, Esq., Hillsborough, Sheffield, being 2nd. Some fine Epiphyllums were shown by Mr. J. Spaight; Mr. D. B. Fellows being 2nd. Mr. J. Spaight had the best specimen Epiphyllum; Mr. Lowwood being 2nd. Classes were provided for Orchids, but none were exhibited. Mr. D. B. Fellows had the best specimen *Camellia*, Mr. Lowwood being 2nd. The best specimen stove or greenhouse plant was *Epacris exoniensis*, from Mrs. H. Wilson. Mr. Spaight had the best three plants of *Selaginellas*, Mr. R. Howarth being 2nd. Mr. J. C. Lowwood had the three best pots of *Mignonette*.

Cut Flowers.—The greatest interest in the cut flower classes centred in that for the best representative collection of large-flowering Chrysanthemums, not more than 12 blooms of any section. There were three competitors, and the judges were under the necessity of disqualifying each, putting on record the reasons for so doing. They then at the request of the representatives of the parent Society awarded the prizes. The most valuable, that of a Silver Cup, value 15 guineas, and £10 in cash, was awarded to Mr. R. Packman, The Gardens, Impney Hall, Droitwich, who had some very fine blooms. His twelve Japanese were *Avalanche*, Madame C. Andiguer, E. Molyneux, Baronne de Prailly, Boule d'Or, Meg Merrilies, Ralph Brocklebank, Val d'Andorre, Jeanne Delaux, Yellow Dragon, Madame John Laing, and Thunberg. His twelve incurved were Lord Alcester, Queen of England, Empress of India, Lord Wolsley, Alfred Salter, Prince Alfred, Golden Empress, Golden Queen of England, John Salter, Jeanne d'Arc, Princess of Wales, and Mrs. Heale. His best reflexed Japanese flowers were Val d'Andorre, Amy Farze, Jeanne Delaux, Maiden's Blush, Madame J. Laing, Criterion, and L'Adorable. His best reflexed large-flowering were King of Crimson, Irene, the everlast Donaghe, Cullingfordi, Golden Christine, the pink, peach, and white varieties also. His best anemone-flowered were Mrs. Pethers, Acquisition, Fleur de Marie, Gluck, Empress, and Lady Margaret. But he staged but six blooms of Japanese anemones, whereas the schedule required twelve. 2nd, Mr. Packman, gr. to C. Shea, Esq., Foot's Cray, Kent, the only Southern grower who competed, who had of Japanese varieties, Boule d'Or, Hamlet, Gloriosum, Ralph Brocklebank, Madame J. M. Pigny, Marsa, Meg Merrilies, Martha Harding, Florence Piercy, and *Avalanche*. His reflexed Japanese were Criterion, Val d'Andorre, Elaine, L'Adorable, and a sport from Madame J. Laing. His incurved, Mrs. Heale, Golden Empress, Queen of England, Lord Alcester, Baron Beust, Jardin des Plantes, Jeanne d'Arc John Salter, Cherub, and Mrs. W. Shipman. His reflexed large flowering, Mrs. Forsyth, Cullingfordi, Dr. Sharpe, Golden Christine, and Chevalier Donaghe. His Japanese Anemone-flowered, Eaban de Mediana, Scur Dorothee Souille, Minnie Chate, Jean Marty, and Mons. Cabrol. His large-flowered Anemone varieties, Miss Annie Lowe, Gluck, Lady Margaret, Georges Sand, Alveole, and La Marguerite. The 3rd prize went to Mr. T. B. Morton, nurseryman, Darlington.

Mr. Parker was the only exhibitor of thirty-six Japanese blooms, not less than eighteen varieties, and very fine they were; the sorts, Boule d'Or, Martha Harding, Maiden's Blush, Japonais, Baronne de Prailly, Comte de Gerniny, Madame B. Pigny,

Duchess of Albany, Meg Merrilies, Ralph Brocklebank, Jeanne Delaux, Madame C. Andiguer, *Avalanche*, Thunberg, Marguerite de Marrouh, E. Molyneux, Madame J. Laing, Middle. Lacroix, Mons. Burnet, Fair Maid, and Ferdinand Feroi.

The best twelve Japanese came from Mr. Arthur Wilson, Hull.

In the distinct classes for cut blooms the leading prize-winners were Messrs. J. G. Lowwood, R. P. Bromhead, and Mrs. Wilson, these three being the only exhibitors who had flowers up to anything like exhibition mark.

Hand bouquets of Chrysanthemums, also of miscellaneous flowers, button-holes, and stands of six bunches of cut flowers did not call for special remark.

There was also a section of classes for cut Chrysanthemums, and also plants from amateurs and cottagers, but they also contained nothing of special merit.

Honorary Awards.—Certificates of Merit were awarded to Messrs. Fisher, Son & Sibray, Handsword Nursery, Sheffield, for a large group of valuable plants arranged for effect; also for blooms of greenhouse *Rhododendrons* and *Lapagerias*. To Messrs. Henry Cannell & Sons, nurserymen, Swanley, for a large collection of cut blooms of single and double *double Pelandronium* of the highest quality, that seemed to excite the wonder of the Sheffield people; also of cut Chrysanthemums of various types, among them a large, deep golden, single variety of great excellence, named Sir Thomas Symonds. To Messrs. Geo. Bunyard & Co., nurserymen, Maidstone, for an extensive collection of Apples and Pears, including many of the newer sorts. To Messrs. Hiram Shaw & Son, nurserymen, Sheffield, for a large group of plants. To Mr. Seagrave, nurserymen, Sheffield, for the same; and to Messrs. Davis & Jones, Chrysanthemum Nursery, Camberwell, for a collection of the newer varieties of Chrysanthemums.

First-class Certificates of Merit were awarded to Mr. E. Beckett, The Gardens, Aldenham House, Elstree, for a very fine Golden Japanese Chrysanthemum named Sunflower, and to Messrs. Fisher, Son & Sibray, for *Lapageria rosea maculata*, a large number of flowers being shown, all regularly maculated with white.

A representative stand of garden requisites was arranged by Messrs. W. Wood & Son, horticultural sundriesmen, Wood Green, which attracted a good deal of attention.

The premium bloom of incurved Chrysanthemums was Lord Alcester, in Mr. Parker's stand from Impney Gardens; and the premier Japanese *Avalanche*, also shown by Mr. Parker.

## CHESHUNT CHRYSANTHEMUM.

Nov. 16 AND 17.—The fifth exhibition of this Society was held in St. Mary's Hall, Cheshunt. The groups of plants were very good, the miscellaneous collections attracting more attention even than those set apart wholly for Chrysanthemums. The cut blooms were numerous and very good, the Japanese section being especially so. The 1st prize group of plants was composed mostly of good examples of incurved and Japanese varieties, and was from Mr. W. Collins, gr. to J. W. Carlisle, Esq., Ponsbourne Park. The group of miscellaneous plants to which the 1st prize was awarded was a meritorious one from Mr. B. Searin, gr. to J. C. Partington, Esq., Heaton House. It was well arranged and mainly made up of Orchids of grand quality, *Odontoglossum crispum* with long graceful spikes; *Cattleya Bowringiana* in several good forms, one of them very richly coloured. Chinese Primulas were excellent in quality, and it was a close contest between Mr. H. Bryant, gr. to E. H. Clarke, Esq., and A. Rowden, gr. to T. Walton, Esq., for the 1st prize; the first-named leading with handsome and distinct examples.

The best blooms were sent from Mr. T. Bettsworth, gr. to R. Ewing, Esq., Barton Grange. His flowers won 1st prize in the class for twelve Japanese and twelve incurved blooms, and he led also for twelve Japanese. Mrs. Wheeler was very fine, large in size, and incurved; the inside of the petals crimson, outer a clear buff colour. Boule d'Or, Meg Merrilies, and R. Brocklebank were also good. Mr. Collins was 1st, with a stand of excellent reflexed blooms. The same exhibitor leading for some excellent Alicante Grapes. Mr. Bettsworth was 1st for six dishes of Apples. The best Pears were sent from Mr. J. Nicholson, gr. to W. Mills, Esq.,

Sewardstone Lodge—they were clean and well ripened fruits.

The most interesting exhibits of Chrysanthemums was that from the nursery of Messrs. Paul & Son, Chislehurst. Some distinct new varieties were exhibited, such as William Earley, Japanese, is an excellent variety, with reflexed petals, the flower full, well formed, and of a rich purple colour; Marsa, D. Stigall, Japanese, petals straight, the flower, rich crimson, shading to maroon at the centre; Mons. Garner, Japanese, deep yellow, orange-yellow margin, twisted petals; Joseph Arch, full purple reflexed; Mons. V. Morel, bluish, petals broad and pointed, very distinct; L'Amie Layton, purplish-rose florets, buff centre, distinct large Anemone variety; Grande Alveola, another good large flowered Anemone, with pale peach flowers, good centre; Miss A. Lowe, a primrose-coloured large flowered Anemone.

#### DERBY CHRYSANTHEMUM ASSOCIATION.

Nov. 17.—In conjunction with this was held also the annual Chrysanthemum show of the Midland Railway Horticultural and Cottage Garden Society, in the spacious Drill Hall, and here, as at Sheffield, it was contended that the season had seriously affected the Chrysanthemums, and especially the plants. The latter were poor for a place like Derby, but the Association is young, and has been in operation four years only.

The best things were found in the open classes, and in that for twelve cut blooms of incurved varieties, Mr. A. H. Powkes, Northampton, was 1st, with some very good blooms; Mr. W. G. Marshall, Taunton, being 2nd. Mr. Powkes also had the best twelve blooms of Japanese varieties, Mr. Marshall being 2nd once more.

There was a class for a group of Chrysanthemums arranged for effect, the best coming from Mr. J. H. Biggs, of Derby; Mr. F. Bancroft, the Hon. Secretary of the Society, being 2nd.

The best bouquet of Chrysanthemums came from Mr. J. H. Goodacre, Elvaston Castle Gardens.

In the classes for cut blooms, open to members of the Society, the principal prize-winners were:—Mr. F. Bancroft, Mr. H. Bancroft, Mr. C. Carrington, Mr. W. Powkes, and Mr. E. Litchfield. The flowers shown were fairly good, but they fell short of what one might fairly expect to see in the North. The same can be said of all the flowers shown from the immediate locality.

Messrs. Richard Smith & Co., St. John's Nursery, Worcester, contributed a collection of fifty dishes of Apples and Pears of an interesting character; and Mr. E. Cooling, nurseryman, Derby, contributed some large plants of green-leaved Dracenas and Palms, also crosses, wreaths, &c.

#### DEVON AND EXETER HORTICULTURAL.

NOVEMBER 16.—The annual exhibition of Chrysanthemums was held in the Victoria Hall, Exeter, on Friday, November 16, and will certainly rank as the best autumn exhibition the Society has yet held. The quality of the exhibits was excellent, everywhere the arrangements of the exhibits in the hall were effective. The Society may congratulate themselves on having had an exhibition second to no county show. The Chrysanthemums in the groups, for quality of bloom were models of perfection. The cut blooms were excellent, the Japanese being perhaps the best; but the incurved varieties were shown in better form than on any previous occasion, the only deficiency to bring them to perfection was the art of 'dressing' them; all other qualities being present.

Fruit, especially Grapes, was equal to anything previously seen here.

#### BIRMINGHAM AND MIDLAND COUNTIES.

Tax twenty-eighth exhibition of Chrysanthemums took place at the Town Hall, Birmingham, on Wednesday and Thursday, November 21 and 22, and was of surprising excellence, considering the injury caused to the plants by early frosts. Chrysanthemums in pots as groups, &c., were attractive. Florists' work was better than usual. The local nursery trade contributed decorative plants. In the fruit classes there was a very fair display,

although as a whole there were in these fewer exhibits than last year. About 100 bunches of Grapes were shown. Pears and Apples were good, the display being enhanced by non-competing lots of fruit from Messrs. T. Rivers & Sons, Messrs. R. Smith & Co., and Messrs. Cranston & Co.

Among the principal prize-winners were the Right Hon. Joseph Chamberlain, M.P. (gr., Mr. Cooper), who took a large number of 1sts, including the principal honours awarded for Chrysanthemums in pots. Mr. J. Corbett, M.P. (gr., Mr. Parker), was equally successful in winning the principal honours for cut blooms. Another very successful exhibitor of Chrysanthemums was Sir Thomas Martineau (gr., Mr. Brasier); Mr. D. Lindsey, gr. to Sir T. Edwards-Moss, Bart., also won several prizes.

The fruit prizes were mainly won by distant exhibitors, the chief of whom were the Marquis of Bath (gr., Mr. Pratt), the Earl of Harrington (gr., Mr. Goodacre), the Earl of Shrewsbury (gr., Mr. Rabone), Mr. Gilman, Ingestre; the Duke of Newcastle (gr., Mr. Gleason), Sir J. E. Moss, Bart., Mr. J. Corbett, M.P., and the Hon. A. C. G. Calthorpe.

Some special prizes, offered by Messrs. Sutton & Sons, for vegetables, six distinct varieties, brought a few fine exhibits, and this department of the show will in future years possibly develop into an attractive feature.

#### LAW NOTES.

##### SANDER v. THE DUCHESS OF MONTROSE.

THIS was an action before Mr. Justice Denman and a special jury to recover £1730 Gs. 4d. for Orchids supplied, and for work done in connection with a conservatory belonging to the Duchess of Montrose.

Mr. Reid, Q.C., in opening the case for the plaintiff, said that he carried on business at St. Albans, and was one of the largest Orchid growers in the world. The Duchess of Montrose had a place called Sefton Lodge, which was at or near Newmarket, and at the beginning of 1887, or the end of 1886, she was desirous of embellishing the house. Accordingly, she had a large conservatory constructed. It was divided into three parts. The central part had a dome, and was intended for a Palm-house, and there were two other departments. The conservatory was constructed by a firm at Birmingham, but the place did not give satisfaction to the Duchess, and she made some complaints to the plaintiff. All he did in connection with the house itself was to give advice and assistance gratuitously to the Duchess as to the work to be done. She arranged with the plaintiff that he should supply the central house with a rockery; and that there should be a lake and also fountains. Unfortunately there was no contract as to price, and, therefore, it would be necessary to call witnesses as to the value of the work done. The plaintiff sent in his account with respect to it, and it amounted to £554, but there was a small mistake, which arose from the plaintiff's book-keeper not being at the time in good health. £16 16s. was included in the account which should not have been included, and that sum would have to be deducted. On the other hand, and for the same reason, that £554 by no means included the whole outlay to which the plaintiff had been put. There were two wings to the conservatory, one of which the Duchess had filled with Geraniums and other plants, and for the decoration of the other wing she contracted with the plaintiff that he should supply 1000 Orchids at one guinea each. The learned counsel said that he believed that this was a very moderate figure indeed, for sometimes they fetched as much as £40, £50, and £100 for one plant. The Duchess left it to Mr. Sander's judgment to provide 1000 Orchids for 1000 guineas, according to his judgment, the object being to get Orchids that would bloom when certain Newmarket races were to be run about the beginning of July. Mr. Sander did his best to supply Orchids to execute this order, and to have the Orchids sent in in June. He heard of no complaint until later on, and indeed, the Duchess expressed great satisfac-

tion when the 1000 Orchids had been placed in one of these side houses. She communicated with the foreman of the plaintiff, and said that she would like some more colour, many of them being white—and necessarily so, because those would be the plants that would be in blossom at the time required. She also told the foreman that Mr. Sander was to send some more Orchids with colour, to an amount not to exceed 200 guineas in value. He, in fact, sent down £126 worth of coloured Orchids, because even his large collection could not supply more than that quantity of coloured Orchids that would bloom at the time required. In July the plaintiff sent an invoice for furnishing the conservatory. That was the central part of it, and the amount was £554. This was followed by another invoice, charging the Duchess with £1050 for the 1000 Orchids, and with £126 for the latter parcel of Orchids. No letter was received from the Duchess at that time, but on July 10 the plaintiff wrote sending an invoice for the total amount of £1730, of which he said a large proportion had been expended in labour and materials, and this being money out of pocket, he asked for £500 upon account. Soon afterwards the Duchess said that she had asked her clerk to write and explain to the plaintiff that the arrangement was that the plaintiff should fill the Orchid-houses for £1000, that he had stated the same to the Duke of Marlborough, and that the money was to be supplied for furnishing both houses. It was added that the Duke of Marlborough and the Duchess of Montrose agreed that the plaintiff had not fulfilled the conditions of the agreement, and that he could take back all the white, unless the plaintiff adhered to the understanding with the Duke of Marlborough that there should be coloured Orchids. The learned counsel added that no doubt the plaintiff had had conversations with the Duke of Marlborough, but the Duke was perfectly aware that the agreement was to supply 1000 plants for 1000 guineas, and that the plaintiff was not to furnish the two houses for £1000. To this communication the plaintiff answered that her Grace had ordered of him 1000 Orchids at £1 1s. each; that he had spoken to the Duke of Marlborough several times about the matter, and that he fully agreed with the plaintiff that it was the best to induce her Grace to have 1000 plants at the price named, and that he had supplied her with plants which were worth much more. He added that he would gladly refer the matter to the Duke of Marlborough, and abide by his decision, feeling that he had done his very best for her Grace, but in the meantime he should be glad to have a cheque for £500. This money was not forwarded, and in February of this year the plaintiff was reluctantly obliged to issue a writ, and subsequently there was an order that upon payment of £700 her Grace should have leave to defend the action.

Mr. Sander, the plaintiff, was examined in support of his counsel. In the course of his evidence he stated that the Orchids were supplied by a certain time, because the Prince of Wales was going down to Newmarket.

Cross-examined by Mr. Philbrick.—I was to select a thousand plants, choosing the size and colour. I got the order in Belgrave Square. I did not book the order. I carried it in my head. I have no scrap of writing about the bargain. I received the order in the morning and executed it in the afternoon. My manager picked out the Orchids for the £126. It was left entirely in our hands. The value of Orchids depends upon the size and variety. I have known bulbs sold at 1s. a-piece; but what I sold to the Duchess were fine established plants. The design of the rockeries was left to me. I had had a previous transaction with the Duchess. She came down to my nursery with the Duke of Marlborough. She bought four Orchids for 16 guineas, which she has never paid me for.

Mr. Philbrick: Did the Duke of Marlborough say that the Duchess would be a valuable customer?—Witness: Yes; and I thought she would be quite a new market for us. I had a correspondence with

Taylor, the head gardener of the Duchess, at Sefton Lodge.

Mr. Philbrick: Did your manager receive the following letter from him?—"Dear Sir,—Your letter to hand. I can assure you her Grace is delighted with the Palm-house. She is continually taking gentlemen and ladies into the place, and spends most of her time there. I consider you have greatly pleased her; and Mr. Sander must keep the pot boiling now she is right; so don't spare coming."—Witness: Yes, he did.

Mr. Philbrick: Did he also write you the following letter?—"Sir,—Your letter came duly to hand. The Duchess sent for Clarke about the tiles, to give an estimate; but nothing is decided at present. I am sure I shall get the old gal round about the Orchids. I had one or two long chats with her, and I think that I quite talked her round. I shall ask her to give you more orders for Orchids when I see her again to speak to her on the matter. We was very full of company; had the Prince of Wales here again; the house was full, and will be again this next week. All things are looking well, and the old gal was very pleased." I only hope she may continue so."—Witness: Yes, he did.

James Collins was called and examined by Mr. Reid.—I have had twenty-five years' experience in Orchid growing. I was sent to Newmarket to arrange the Orchids. They were worth £1000 and more. One of the houses was full of greenhouse plants. The Duchess came on Sunday, July 3, and saw me on the Monday. I saw her Grace alone, and she said the arrangement of the Palm-house and Orchid-house was simply beautiful. She said the Prince of Wales was going to dine with her on Thursday night, and she should like some more colour. She asked me to order coloured to the amount of £200. She sent a message to Mr. Sander to say she was much pleased. I gave the order to the manager. He fixed the price, and I took them to Newmarket the next Wednesday. The price was rather under than over. After I had arranged this last the Duchess said she thought it was a great improvement.

Cross-examined by Mr. Philbrick.—She did not complain of too much white. She merely suggested that some colour would improve. She did not say she was disappointed and wanted more colour. I unpacked them and arranged them on the shelves. I was there six weeks taking care of them. It requires great skill to arrange Orchids and the colours.

Mr. Coningsby, the foreman of the plaintiff's Orchid-houses, said that the plaintiff told him to pick out 1000 Orchids to the value of 1000 guineas, and he was very careful in selecting them. There was not a single plant in the 1000 that was worth less than a guinea.

Several experts were examined, and stated that in their opinion the prices charged for the work done and for the Orchids supplied were fair, and indeed lower than usual.

Upon the conclusion of the evidence for the plaintiff the further hearing of the case was adjourned. As we are going to press, we learn the jury gave a verdict in favour of Mr. Sander for the full amount claimed, with costs.

**TARO (CALADIUM ESCULENTUM).**—This is best grown on low ground near to water. In Hainau the beds are made about 4 feet wide, with a trench on each side to collect water. Plants are raised from the small Taros about the size of a Plum growing on a parent root, and these are set about February or March in two rows at each side of the bed, and between these rows holes are dug about the size of a Dutch cheese, which are kept full of human manure. Two kinds of Taros are known, the early maturing about July, and the late, which is ready about October; the first weighs about 6 oz., and the second about 2 lb. Of some kinds of Taros the leaves only are eaten as vegetables. They are gathered as soon as they appear, which is once every few days.

## THE WEATHER.

[Accumulated temperature indicates the combined amount and duration of the excess or defect of temperature above or below 32° F. for the period named, and is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

## THE PAST WEEK.

The following summary record of the weather for the week ending Nov. 19, is furnished from the Meteorological Office:—

"The weather has again been dull, rough, and unsettled very generally, with much rain in the north and north-west and frequent but less heavy falls elsewhere. Thunder and lightning were experienced at several of our north and northwest stations on the 17th.

"The temperature has been much above the mean in all districts. In Scotland the excess has varied from 5° to 7°, and in Ireland from 6° to 7°, while over England it ranged from 6° at the north-west stations, and 7° in the north-east and south-west, to 8° in 'England, E.,' 9° in 'England, S.,' and 10° in the 'Midland Counties.' The highest of the maxima which were registered on the 15th in Ireland, and on the 16th over Great Britain, varied from 56° in

'Scotland, W.' to 62° in 'England, E.' The lowest of the minima were recorded at most stations either on the 18th or 19th, when they ranged from 32° to 35° in Scotland, from 39° to 41° in Ireland, and from 36° to 40° in England; in the 'Channel Islands' the lowest reading was 46°. During the greater part of the week the minima were very high for the time of year.

"The rainfall has been considerably more than the mean in Scotland and rather more in some parts of England and Ireland, but in the east and south of England and in the south of Ireland a deficit is shown.

"Bright sunshine has continued very deficient generally, but has been rather more prevalent in Ireland and the 'Channel Islands' than elsewhere. The percentage of the possible amount of duration ranged from 3 in 'England, N.W.' and 9 in 'Scotland, N.' to 18 in the 'Midland Counties,' to 22 in 'Ireland, S.' and 25 in the 'Channel Islands.'"

## MARKETS.

### COVENT GARDEN, November 22.

[We cannot accept any editorial responsibility for the subjoined reports, which, however, are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and are responsible for the quotations. It must be remembered that these quotations represent averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the fact that, not only from day to day, but often several times in one day, and therefore the prices quoted as averages for the past week must not be taken as indicating the particular prices at any particular date, and still less can they be taken as guides to the prices in the coming week. Ed.]

BUSINESS still quiet. Market well supplied with all classes of goods. Prices low all round. *James Webber, Wholesale Apple Market.*

## SEEDS.

LONDON: Nov. 21.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, E.C., report to-day's market without any striking feature. Clover seeds generally are quiet, but firm. The present lull coming after so much excitement and activity is regarded as quite healthy. Some small orders still come to hand for Winter Vetches. Blue Peas are in good demand at full prices: choice samples are inquired for. In Haricot Beans the tendency continues upwards. There is no change in either Mustard or Rape seed. Bird seeds are steady. Feeding Linseed hardens in value.

## CORN.

Averages.—Official statement showing the average price of British corn, imperial measure, in the week ended November 17:—Wheat, 31s. 11d.; Barley, 27s. 10d.; Oats, 16s. 9d. For the corresponding week in 1887:—Wheat, 30s. 6d.; Barley, 23s. 6d.; Oats, 15s. 6d.

## FRUIT AND VEGETABLES.

SPITALFIELDS: Nov. 21.—Good supplies of all kinds of farm and market garden produce. Dull trade, except for best samples, which realise fair prices. Quotations as under:—Pears, 2s. 6d. to 3s. 6d. per bushel; English Apples, 3s. to 5s. 0d.; d. 1s. 6d. to 2s. 6d. per half-bushel; American do., 10s. to 18s. per barrel; Cauliflowers, 3s. 6d. to 6s. 6d. per tally; Savoy, 2s. to 3s. 6d. do.; Cabbages, 1s. 3d. to 2s. 6d. do.; Brussels Sprouts, 1s. to 1s. 6d. per half-sieve; Greens, 1s. 6d. to 2s. 6d. per dozen bunches; Turnips, 1s. 9d. to 2s. 0d.; Carrots, 1s. 9d. to 2s. 6d. do.; Parsley, 2s. to 2s. 6d. do.; Horseradish, 10d. to 1s. 2d. per bundle; Celery, 4s. to 12s. per dozen bundles; Endive, 1s. 6d. to 2s. per dozen; Cos Lettuce, 4d. to 8d. per score of 25; English Onions, 4s. to 5s. per cwt.; Belgian Onions, 3s. to 3s. 6d. per bag; Dutch Onions, 3s. 6d. to 4s. 3d. do.; pickling Onions, 4s. to 5s. 0d.; Carrots, 20s. to 30s. per ton.

## POTATOS.

BOROUGH AND SPITALFIELDS: Nov. 20. — With moderate supplies the trade has been firmer, and a fair weight of supply cleared off.—Regents, Scotch, 85s. to 105s.; English, 65s. to 100s.; Hebrons, 60s. to 110s.; Magnum Bonums, 65s. to 100s. per ton.

SPITALFIELDS: Nov. 21.—Quotations:—Beauty of Hebron, 80s. to 100s.; Magnums, 65s. to 70s.; Imperators, 80s. to 90s.; Champions, 65s. to 70s.; Regents, 60s. to 90s. per ton.

## HAY.

Averages.—The following are the averages of the prices obtained at the various metropolitan markets during the past week:—Clover, prime, old, 120s. to 144s.; new, 80s. to 110s.; inferior, 45s. to 75s.; prime meadow hay, 120s. to 130s.; good new hay, 80s. to 100s.; inferior, 40s. to 70s.; old straw, 42s. to 48s.; new, 29s. to 44s. per load.

## NOTICES TO CORRESPONDENTS.

CARPET-RED DESIGNS: *Carpet Bed*. We have no intention of illustrating the designs you mention. Send to Messrs. Cannell & Sons, Swanley, Kent, for a book of patterns.

CORRECTION.—In "Douglas Fir," p. 569, col. a, Cascade Range rainfall—instead of 2 feet 6 inches, read 64 inches.

CORRUGATED IRON TUBS: *H. H. S.* We have no experience of plant tubs made of this material, but should think it is about one of the worst to use for the purpose. Unless galvanised, they will not last long; and when galvanised, the roots coming in contact with the surface would be injured. Use slate sides, or Oak staves which have been charred on the inner side. The latter will last ten years if made of sound material well dried before being made-up.

NAMES OF FRUITS: *Constant Subscriber*. The large number you send is quite unreasonable. You should confine yourself to six specimens at one time. *Apples*: 1, Warner's King; 2, Colonel Vaughan; 3, Blenheim Orange; 12, Sam's Crab; 13, Downlow's Seedling. *Pears*: 1, Beurré Hardy; 2, Williams' Bon Chrétien; 3, Soldat d'Espérance; 4, Uvedale's St. Germain; 5, Colmar d'Arenberg;

6, Beurré Superfin; 7, Marie Louise d'Oclee.—*R. A. G. Apple*: 1, Hambleton Deuts; 2, An; Pear: 2, Bishop's Thumb.—*E. Mann*. Blenheim Orange.—*A. M.* Pear, not known.—*P. C.* 1, Beurré Bosc; 2, Comte de Lamy; 3, Seckle, true.—*James Gaddes*. 8, Louise Bonne of Jersey; 9, Seckle; 4, Brown Beurré; 24, not recognised; 25, Bergamot Cadette.—*L'Allegro*. Pear, rotten. Apple, King of the Pippins.—*H. P. Reynolds*. Apple, Tyler's Kernel.—*G. Massey*. Apple, Fearn's Pippin.

NAMES OF PLANTS: *C. W. K.* Cypripedium barbatum var., Cypripedium Crossianum, the greenish flower.—*Hull*. Gongora galeata (Acropera Lodigiesii).—*E. M.* Pleione lagensiana.—*G. Mantin*. It is impossible to name Orchids from the miserable withered scraps you send. The pollen masses are wanting in many cases. You must send fresh material together with leaves if you expect us to do anything.—*J. Needham*, Rugby. 1, Diplacus glutinosus; 2, Helleborus fetidus.—*P. D. W.* You did not affix numbers to your specimens, but the one with cones is the true Thua gigantea (of which T. Lobbi is a garden synonym), and the other is Libocedrus decurrens. The name Lobbi should be abandoned, as it is altogether irregular and not recognised, save in nursery catalogues.—*W. H. C.* Apparently a starved Clarkia.

ORCHIDS FROM BRITISH HONDURAS: *J. F. Hull*. There are many Orchids indigenous to British Honduras which it would be interesting to get over for yourself and friends, but which would scarcely be profitable commercially. Cattleya Bowringiana is one of the best; Laelia (Brassavola) Digbyana, also pretty, if not free-flowering; Brassavola venosa is a fragrant species, and Schomburgkia and Epidendrum are plentiful, the latter in several species.

PRUNING EVERGREENS AND PRIVET: *L. C.* The best periods of the year for merely cutting back young growth of evergreens which do not flower in the spring, or from which flowers are not desired, are April and August—late if in the South and West, but early in the month in the North-midland and North. All pruning of evergreens should be done with the knife or scissor. Cutting back old limbs or heading back severely may be done in late autumn and winter—preferably the former. Prune Privet any time between March and the end of July, once, twice, or thrice, as may seem desirable. Ordinarily the second pruning is done in July, and, except in warm moist districts, a third will seldom be required. Old plants may be cut-in hard in late autumn; or, where a bare look in the plants is objected to during winter, the work may be done in March.

SCARLET EGG-FRUIT FIT TO EAT: *R. E. W. Yes*; when cooked it is as good to eat as the others.

VINES: *A. B. C.* Mildew attacking the decaying foliage. It is of no consequence if you burn the foliage and clean the canes. The Fuschias are affected with Scale; use Gishurst Compound. Your question should have been addressed to the Editor and not to the Publisher.

# THE THAMES BANK IRON COMPANY

(Telegraphic Address—"HOT-WATER, LONDON." Telephone—No. 4,743)

Have now pleasure in bringing to the notice of Horticulturists and Gardeners generally their  
**NEW PATENT (No. 9090, 1888) HORIZONTAL TUBULAR BOILER,**  
Which is, without doubt, the Best All-round Boiler in the Market.

It combines all the advantages of its class so well known, and by the improved method of forming the joints—viz., with India-rubber Washers, the old and too often ineffectual way of caulking the joints is entirely dispensed with.

SECTION OF PATENT JOINT

It can be erected in a few hours, and may be relied upon as a thoroughly sound and good Hot-water Generator. It has been carefully tested in every possible way, more especially with regard to power and durability, and the results have been highly satisfactory.

THE LARGEST AND MOST COMPLETE STOCK OF

**HOT-WATER BOILERS of EVERY DESCRIPTION**

PIPES, CONNECTIONS, VALVES, VENTILATING GEAR, &C.

INSPECTION INVITED.

PRICE LIST ON APPLICATION.

ILLUSTRATED CATALOGUE, 1s.

UPPER GROUND STREET, BLACKFRIARS, LONDON, S.E.

## GROMPTON & FAWKES,

HORTICULTURAL BUILDERS,  
CHELMSFORD.

NEW BOOK of Photo-Lithographed Sketches of Winter Gardens, Ranges of Hothouses, Vineries, Architectural Conservatories, &c., of various Designs and Sizes, recently constructed, erected, fitted, and heated complete by us in different parts of the country; with particulars of the most successful Hot-water Heating Apparatus of the century. Post-free on application.

## THE LOUGHBOROUGH GREENHOUSE HOT-WATER APPARATUS.

This is the simplest, cheapest, and most apparatus made. It requires no brick setting, no stop-hole, and no hot-water after for fixing. The Boiler stands in the Greenhouse, the front only being outside, so that the whole of the heat from the Boiler itself is utilised. It burns over twelve hours without attention, at a nominal cost. Price, as supplied, with Boiler, open feed syphon, 12ft. of 4-inch hot-water pipe, and patent joints, complete, £1 4s. Delivered free to any station. Discount for cash. Cost of apparatus COMPLETE for Greenhouses as below, delivered free, with pipes cut and fitted ready for fixing.

## PASCALL'S PATENT PROPAGATOR

Made in superior earthenware, 14 inches long, 6 1/2 inches deep, and 6 inches wide. Inside, 2 1/2 inches from the top, is a perforated movable false bottom, upon which the soil for cuttings or seeds is placed, the lower half being filled with water, which is replenished when required through the funnel. It fits evenly on 4-inch hot-water pipes, and will be found a simple and effectual means of utilising them for propagating purposes. With the false bottom removed it forms an effective vapouriser. Price 8s. each. Six carriage and package free to any station in Great Britain on receipt of P.O. for £1 1s. Sole makers and patentees, T. PASCALL & SON, South Norwood Pottery, Surrey, S.E. GARDEN POTS.—Ours are unsurpassed by any in the Trade. 4s. orders carriage paid to any goods station within 100 miles of London. Send for Price List. Orchid Pottery of every description. Samples carriage free.—THOS. PASCALL & SONS, South Norwood Pottery, Surrey, S.E.

### CULTURAL DIRECTIONS for the ROSE,

by JOHN CRANSTON, King's Acre Nurseries, near Here-  
ford, containing every information relative to Rose Culture;  
a choice selection of all the finest Roses, fully described; a select  
List of sorts adapted to various circumstances, situations, soils,  
and climates; a complete Catalogue of varieties of Roses intro-  
duced up to the present time; and a Calendar of Operations to  
be performed during each month throughout the year.

### Estate Sales.

The best County medium for Advertising Sales of  
Estates is

THE WORCESTER HERALD, the largest  
and leading County paper. Extensive circulation among  
the upper and middle classes in Worcestershire and adjoining  
counties. Advertisers would do well to forward for reference  
and distribution, plans and particulars of Estates, Catalogues  
of Machinery, Furniture, Books, and other property advertised  
in the columns of the Worcester Herald. Specimen copies sent  
free. Published Friday for Saturday, price 2d.  
Offices, 72, High Street, Worcester.

### Sales of Stock and Agricultural Effects.

THE WORCESTER HERALD is the most  
effective organ for giving publicity to announcements of  
this class. It is the largest and leading Agricultural paper in  
the county, and circulates most extensively among Agricul-  
turalists in and around Worcestershire. Specimen copies free.  
Published Friday for Saturday, price 2d.  
Offices, 72, High Street, Worcester.

### Farms to be Let.

LAND AGENTS, ESTATE MANAGERS, and all having Farms  
to Let, would do well to Advertise in  
THE WORCESTER HERALD, the Largest  
and Leading County Paper. Specially adapted for  
bringing such notices before Tenant Farmers. Large Circula-  
tion, moderate charge. Specimen free. Price 2d. Published  
Friday for Saturday.  
Offices, 72, High Street, Worcester.

### GARDENING APPOINTMENTS.

Mr. J. HARRISON, late Head Gardener at Watlington Park, Oxon, has been appointed as Head Gardener to Sir A. PAXTON, Bart., Swifts House, Bicester, Oxon.

Mr. C. DAWSON, lately Foreman at Eweny Priory, Bridging, has been engaged as Gardener to Mrs. SAUNDERS DAVIES, Kilwendy Park, Boncatch, Pembrokeshire, South Wales.

Mr. W. A. COOK has been appointed Gardener to Major HENEGGE, Compton Bassett, Calne, Wilts, in place of Mr. ALLEN, who retires after forty-nine years' service.

**WANTED, a PARTNER** (with capital), active or otherwise, in a well-established Nursery, Florist's Business.—R. M. *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**WANTED a HEAD WORKING GARDENER**, for a Gentleman's establishment, where the chief part of the produce is sold.—Must be thoroughly competent in all branches, including Picking Fruit and Flowers, and must be a good worker. With special knowledge of Growing Chrysanthemums, Roses, Violets, and Store Plants. Must be a married man, and between 30 and 40 years of age.—Address, enclosing photograph, to J. P. *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**WANTED, by a Lady, a strong, active, single Man**, as GARDENER, who understands Vines, Cucumbers, &c. Wages, at first, 18s. per week.—M. P. Taylor's, Chigwell, Essex.

**WANTED, a competent PROPAGATOR.** One who is thoroughly experienced in Roses, Clematis, &c.—Apply, stating full particulars, to H. ENGLISH, Clevedon Nurseries, Clevedon.

**WANTED, a few really first-class CUCUMBER GROVERS.** None but A1 men need apply.—State particulars of experience, wages required, and send copies of testimonials to F. ROBINSON, The Nursery, Foulde's End.

**WANTED, for the Counter, a HEAD SHOPMAN**, to take entire charge of Retail Work in Bulbs, Vegetable and Flower Seeds, and to be personally in charge of the Counter work to be performed. No one need apply unless able to produce first-class references, and have at least 12 years' experience.—W. M. BAYLOR HARTLAND, Seedman, 24, Patrick Street, Cork.

**WANTED, a SHOPMAN**, for Florist's Shop. He must be a good Salesman, and be able to arrange tastefully.—State full particulars to H. ENGLISH, Clevedon Nurseries, Clevedon.

**WANTED, an ASSISTANT SHOPMAN**, about 20, of good address, active and industrious, for Seed and Bulb Trade.—KER and SONS, Bassett Street, Liverpool.

**WANTED, AT ONCE, good COUNTER HAND.** Apply by letter only, stating experience and salary required, to COOPER, TABER and CO. (Limited), 90, Southwark Street, London, S.E.

**WANTED, a SECOND or good THIRD HAND**, for Retail Seed Counter.—Apply, with age, reference, and salary required, and when at liberty, to S. F. ARMITAGE, Nottingham.

**WANTED, a JUNIOR CLERK.**—State age, experience, salary required.—PARKER and SONS, Nursery Seedmen, Bristol.

### WANT PLACES.

Letters addressed "Poste Restante" to initials or to fictitious names, are not forwarded, but are at once returned to the writers.

**POSTAL ORDERS.**—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable to No. 42, DRURY LANE, to W. RICHARDS, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person from cashing it, or may fall from negotiating it.  
N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

**J. AND R. THYNE, NURSERYMEN**, Glasgow, can always RECOMMEND MEN of known character and ability as GARDENERS to any Lady or Gentleman requiring such. Applications solicited.

**RICHARD SMITH and CO.** beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

**SCOTCH GARDENERS.**—JOHN DOWIE (of the late firm of Downie & Laird), Seedman, 144, Princes Street, Edinburgh, has at present on his list a number of SCOTCH GARDENERS, waiting for engagements. He will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman requiring a trustworthy and competent Gardener.

**GARDENER (HEAD).**—Age 43; thoroughly experienced in all branches of the profession. Highly commended from first-class establishments.—T. M., 5, Station Terrace, Camberwell, S.E.

**GARDENER (HEAD).**—Mr. OSMAN, Gardener to Charles Keyser, Esq., Warren House, Great Stanmore, Middlesex, can with confidence recommend a thorough practical man as above. Sixteen years' experience in all branches.

**GARDENER (HEAD);** age 30, married when suited.—D. MACKAY, Gardener to the Right Hon. Sir Massey Lopes, Bart., can with confidence recommend his Foreman, E. Dave, to any Lady or Gentleman requiring a thorough practical good Gardener. Fifteen years' practical experience.—Maristow, Boborough, Devon.

**GARDENER (HEAD).**—G. HALL, for nine years Gardener to the late Lord de Tabley, Tabley House, and previously Foreman at the Duke of Cleveland's, Raby Castle, is open for re-engagement. Left through death of employer. Twenty-two years' first-class experience. References of the highest order.—G. HALL, 11, Tipping Street, Altrincham.

**GARDENER (HEAD WORKING).**—ALFRED KEMBER, Bosborough Court, Cork, offers his services as above. Thoroughly acquainted with every branch of Gardening; and first-class references. English and Protestant.

**GARDENER (HEAD WORKING).**—Age 39, married, one daughter (age 13); twenty-four years' experience. Good all-round worker and testimonials.—C. C., 84, St. John's Road, Upper Holloway, N.

**GARDENER (HEAD WORKING),** where more are kept.—Married, no family; successful Grower of Fruit, Flowers, and Vegetables. Good character.—E. ATKINS, Hargraves Gardens, Staunsted, Essex.

**GARDENER (HEAD WORKING).**—Married, no family; has had a great deal of experience in some of the best establishments in England. Some knowledge of Farming, if required.—WILLIAM THOMPSON, Finedon Hall, Wellingborough.

**GARDENER (HEAD WORKING).**—In the prime of life, single; trustworthy, and thoroughly competent in all branches. Abstainer. Five years' excellent character, and high testimonials.—J. H., 39, Tectott Road, King's Road, Chelsea, S.W.

**GARDENER (HEAD WORKING),** where one or two others are kept.—Age 46, married; thirty years' experience. Understands Vines, Greenhouse, Flower and Kitchen Gardening. Can have twenty years' good character from present employer.—GARDENER, Trafalgar, Salisbury.

**GARDENER (HEAD WORKING);** age 30, married, two children.—GEORGE PICKER, over ten years Gardener to A. S. Leslie Melville, Esq., of Branton Hall, Lincoln, is open to engage with any Lady or Gentleman where three to six are employed in the garden. Highest reference.—Address the Gardens.

**GARDENER (HEAD WORKING).**—No young family; strong, active, and thoroughly experienced in all branches. Highly respectable. Strongly recommended by present and late employers. Wife could Manage a Dairy if required. Fresh garden required.—H. J. M., Mr. J. W. Silver, Norbury Nurseries, Streatham, S.W.

**GARDENER (HEAD WORKING),** where more are kept.—A. M., married, when suited; practical in Orchids, Stove and Greenhouse Plant, Furnishing, Early and Late Forcing, Fruit, Flowers and Vegetables, Flower, Fruit, and Kitchen Gardening, Pleasure Grounds, Carpet Bedding, &c. Highest references as to character and abilities.—GARDENER, 24, Brynmor Park, Battersea Park, S.W.

**GARDENER.**—Age 40, married; no objection to Horse. Wife good Cook.—W. S., Old Spa House, South Norwood Hill, S.W.

**GARDENER (good WORKING).**—No family; thoroughly experienced. Wife good Laundress; take care of house if required. Good character.—J. J., 2, Leeson Road, Herne Hill, Brixton, S.E.

**GARDENER (SINGLE-HANDED).**—Age 30, married; fifteen years in first-class establishments. Well versed in all his branches. Good character from previous places.—A., Finkney Green, Maidenhead, Berks.

**GARDENER (SINGLE-HANDED).**—Age 26, married; two and a half years in present situation. Good experience indoors and out, leaving through death.—J. PERKINS, Park House, English Garden.

**GARDENER (SECOND),** where four or five are kept.—Eight years' good character.—W. H., Mr. Goodman, Postman, 35, Prince Street, Swindon, Wilts.

**GARDENER (SECOND),** in Nursery or Private Establishment.—Age 24; experienced in Planting and Propagating. Good references.—EDWARD A. BUSH, Cleve, Yatton, Bristol.

**GARDENER (UNDER),** in a Gentleman's Garden.—Age 19; good character.—ROBERT WOODMAN, Esq. Post-office, Surrey.

**GARDENER (UNDER),** in the Nursery.—Young, steady; eight years' experience.—M. BUCKLAND, 313, Borough Road, Birkbehead.

**GARDENER (UNDER).**—Age 20; seven years' experience. Two years' Nursery experience. Good references.—J. RYNOR, 51, Thorne Street, Wandsworth Road, S.W.

**FOREMAN**, in the Houses.—Good experience in Plants and Fruit. Foreman in last two situations. Well recommended from past and previous Gardens.—W. H., 80, Queen Street, Camden Town, N.W.

### To the Trade.

**FOREMAN (GENERAL), and PROPAGATOR.**—Age 30; Fruits, Roses, Rhododendrons, Conifers, Clematis, and General House of the Trade.—F. A., 41, Wellington Street, Strand, W.C.

**FOREMAN, or SECOND.**—Age 25; nine years' practical experience in Fruit and Plants, good references. Three years in last situation.—A. K., 13, Thurston Road, Coppe Hill, Wimbledon, Surrey.

**FOREMAN, or SECOND.**—Age 27, married; thirteen years' experience. Well recommended by all previous employers.—FOREMAN, 4, Doveclade Place, Finner Road, Sudbury, Harrow, N.W.

**FOREMAN, or FIRST JOURNEYMAN**, in the Houses. Experienced from early life in good places. Good testimonials. Total abstainer.—C. COLLINS, 10, Clarence Road, Birkdale, Southport.

**FOREMAN PROPAGATOR and GROWER.**—Age 34; thoroughly experienced. Efficient in the Cut Flower Trade. Good references.—L. *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**JOURNEYMAN**, inside or out.—Age 21; four years in present situation; two under Glass. Thorough good character. Industrious and obliging.—H. C., Morfou Gardens, Salford, Devon.

**JOURNEYMAN**, in the Houses, in a good establishment.—Age 18; four years' good character from present situation.—W. BAKER, Weston, Gardens, Rhinfall, Salop.

**JOURNEYMAN (or good SINGLE-HANDED).**—Age 28; has a knowledge of Plant and Fruit Growing. A Premium of £2 will be given to anyone procuring advertiser a situation.—E. ROBERTS, Welsh Flankton, Ellesmere, Salop.

**TO GENTLEMEN, &c.—EDWARD BAXMAN**, Gardener to the Hon. F. Levison Gower, Holmby, Dorking, will be pleased to recommend his Foreman to any Lady or Gentleman requiring the services of an experienced and trustworthy man. Married, age 30.

**GROWERS for MARKET.—ADVERTISER** can recommend a reliable young man, accustomed to Growing Roses, Ferns, Tomatoes, Cut Flowers, &c., extensively for Market.—The MANAGER, Framfield, Framfield, Sussex.

**TO MARKET GROWERS.**—Wanted, a situation in a Market Growing Establishment. Understands Growing Grapes, Tomatoes, Melons, Cucumbers, Strawberries, &c. Age 30.—Apply, with particulars, to R. C., 71, Grayshot Road, Lavender Hill, London, S.W.

**TO NURSERYMEN, &c.—A young Man** (age 19) desires re-engagement in a Nursery or Private Establishment. Total abstainer. Good references.—J. B., Tailor Road, Peckham, S.E.

**SHOPMAN, or MANAGER.**—Age 30; thorough knowledge of Seed, Blub, Plant, and Flower Trade. Good references.—W. BUCKLAND, 35, Tectott Road, King's Road, Chelsea, London, S.W.

### Seed Trade.

**SHOPMAN.**—Age 23; eight years' experience. Excellent references.—F. W. B., 371, High Street, Cheltenham.

**SHOPMAN, or SECOND, or as BOOK-KEEPER.**—Advertiser, with nine years' good experience in all departments, desires engagement. Good references.—CERES, 26, Sussex Road, Ford, Devonport.

**TO NURSERYMEN.**—Advertiser (age 29) desires situation in Cut Flower Department. Good at Bouquets, Funeral Designs, &c. Also knowledge of Growing.—T. J. VIGOR, 61, Conybeare Street, Birmingham.

**ASSISTANT.**—Age 22; six years' experience. Good references.—*Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**CLERK, or other position of Trust** in a Nursery.—A young, well educated, good Writer and Arithmetician, seeks situation. Excellent references.—A. S., Waltham Gardens, Lymington, Hants.

**APPRENTICE.**—Will any wholesale Seedsman or Florist take an active Boy, who wishes to learn the business as Apprentice. Give two years Indoors.—Mrs. CAMPION, Urmoston, Manchester.

### To Head Gardeners.

**COWMAN.**—Married; willing to fill up time in Rearing. Wife good Poultry and Dairy woman. Well up in Rearing Poultry.—J. EDWICK, Wharton Grange, Framfield, Sussex.

**STOKER, or ODD MAN**, in Nursery or Private.—Age 33; good reference.—T. SIMMONDS, East View Cottages, Stamver Road, Staines.

**HOLLOWAY'S OINTMENT AND PILLS.**—Biliousness and Dyspepsia.—There is no organ in the human body more liable to derangement than the Liver; food, fatigue, climate, anxiety, all disorder its action and render its secretion of the bile, more or less depraved, superabundant or scanty. The first symptoms should receive attention. A pain in the side or on the top of the shoulder, a harsh cough and difficulty of breathing, restlessness at night, burning dreams, dry mouth, furred tongue, with morning uneasiness, are signs of Liver disease, which are removed without delay by friction with Holloway's inestimable Ointment over the pit of the stomach and right side. The Pills should be taken without delay. Peers and paupers will alike be cured.

**BOULTON & PAUL,** Horticultural Builders,  
NORWICH.

**No. 73.—SPAN-ROOF GARDEN FRAME.**

This Frame is strong and very handy to use. Plants grow very strong and quickly in this form, owing to its ample light and ventilation. The sides of the Frames are 14 inches high, the ridge is 2 feet 3 inches. Lights turn quite over. Glazed with 21-oz. English glass, and painted four coats.

THE ALBION LAMP COMPANY, Aston Brook Lamp Works, BIRMINGHAM.

# THOMAS GREEN & SON, LIMITED,

SMITHFIELD IRONWORKS, LEEDS, AND SURREY WORKS, BLACKFRIARS ROAD, LONDON, S.E.,

HORTICULTURAL ENGINEERS to HER MAJESTY THE QUEEN, call Special Attention to their Patent Wrought-Iron Municipal or Angular Chambered and Tubular

## HOT-WATER BOILERS,

And others with SHELVES, and Hollow or Ordinary Cast-iron GRATE BARS.

**SADDLE BOILERS.** WITH WATERWAY BACKS and WELDED BOILERS, any of which are specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c. They are the neatest, cheapest, most effective, and durable of any extant.

The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.

These Patterns secured the FIRST and HIGHEST PRIZE—a SILVER MEDAL—at the Royal Horticultural Society's Exhibition, South Kensington, London, June 1, 1881.

### The Best Boiler Extant.

— FRONT ELEVATION —

The longitudinal section gives a view of the fire-box, water space, flues, &c.

— LONGITUDINAL SECTION —

The front elevation shows it set in brickwork, which is necessary for this class of boiler.

SECTIONAL PLAN

The cross section gives a view of the fire-box, water space and V-shaped back.

## TESTIMONIALS.

Messrs. THOS. GREEN AND SON, LTD., NORTH STREET, LEEDS.

Re HEATING APPARATUS.

Borough Engineer's Office, Municipal Buildings, Leeds, January 9, 1886.

GENTLEMEN,—I have great pleasure in bearing testimony to the efficiency and satisfactory working of the Hot-water Heating Apparatus you erected in these public buildings. The buildings are four storeys high, and we have a total length of about 25,000 feet of piping in them, varying in size from 1½ in. to 6 in. diameter, with their connections, &c. The several offices and rooms can all be in operation at one time or separately, and the heat regulated by means of the valves to the temperature required, even in the coldest weather.

Two of your Patent Municipal Pattern Boilers, No. 4, work the whole of this piping easily, although we have three of them fixed. They are very powerful and economical in the consumption of fuel, and I am pleased to be able to report of them and the apparatus so favourably.

I am, Gentlemen, yours truly, THOS. HEWSON, Borough Engineer.

GENTLEMEN,—The large Municipal Boiler which you sent me last year is doing its work satisfactorily; it is heating 5,000 feet of 4-inch pipe in one of my nurseries, and I am quite sure that it has power to work a much greater length, while in cost of fuel it compares favourably with my other Boilers.

I have now five of your Boilers in use, and I cannot speak too well of their heating powers, or their comparatively small consumption of fuel.

Messrs. THOS. GREEN AND SON, LTD., LEEDS.

Yours faithfully,

(Signed)

G. W. BASIFORD.

CONDITIONS.—Prices are quoted in English Sterling, and where not otherwise stated, relate to plants collected from their natural habitat, delivered free of all charges at the port of shipment. From there Buyers take all risk and expense. The price per 1000 plants is charged on orders of 500 and upwards; that per 100 plants on orders from 50 and upwards. On orders of 2000 plants of the same species a reduction of 15 per cent. is allowed; while on less than 50 plants of the same species a higher rate of 50 per cent. is charged. The packing is executed under F. C. Lehmann's personal care, and the methods employed are those which an experience of over twelve years has proved to give the best results; but under no condition will he hold himself responsible for the state or condition of the plants on their arrival; and Consignments once shipped at the port are entirely at the risk and expense of the persons who have ordered them. To secure the arrival of the Plants in good condition, Consignments—if not expressly otherwise ordered—will be dispatched only when the plants are in fit condition to travel; the months being January to April, and July to October; and as the communication in this country is defective and wearisome, and the months being few during which shipments can be made, orders should be sent in as early as possible, so as to allow ample time for their execution. The amount of the Orders will be covered by Bills of Exchange drawn on the issue of the Bills of Lading; amounts under £25 payable three days after sight; above that amount 90 days after sight. Payments may also be effected through Messrs. ROSENG BROTHERS & CO., 10, Basinghall Street, London, E.C.

## SHARPE'S VICTOR POTATO. CAUTION.

MESSRS. CHARLES SHARPE AND CO., Sleaford, Lincolnshire, wish to caution buyers of the above Potato to see that they are supplied with the true variety, as many spurious stocks are offered under the name of Victor, and great disappointment has ensued.

The true VICTOR, as sold by Messrs. CHARLES SHARPE & Co., is a medium-sized flatish oval, smooth-skinned variety, with very shallow eyes and yellow flesh—extremely early, producing Potatoes fit for use in eight or ten weeks from planting. Large quantities of a later, rough-skinned, round white-fleshed Potato have been sold for it by some houses.

To secure the true kind apply either to CHARLES SHARPE & Co., or to a firm supplied direct from them.

# NOVELTY FOR 1889.

SPECIAL OFFER TO THE TRADE.

## KALANCHOE CARNEA.

Awarded a First-class Certificate, Royal Horticultural Society, January 11, 1887.

# JAMES VEITCH & SONS

*Beg to direct special attention to this Sterling Novelty,  
now offered for the first time.*

This strikingly beautiful decorative plant commences to flower at Christmas, and continues in bloom throughout January and February, and is a most welcome addition to the winter flora; its bright and pleasing colour being very attractive during the dull winter months.

The plant was recently introduced from South Africa, is of easy culture, very floriferous, and succeeds well in a temperature of 50° to 55°; it attains a height of about 18 inches, and is of good bushy habit.

The flowers, which are borne in large clusters, are of wax-like consistency, last a long time in perfection, are of a beautiful delicate pink colour, and, in addition, are deliciously fragrant, which greatly enhances the value of this charming plant.

Retail Price, 1s. 6d. per packet. Trade Price on application.

### TESTIMONIALS.

From Right Hon. LORD BURTON, Rangmore, near Burton-on-Trent.

"Messrs. Foster & Pearson, of Beeston, near Nottingham, have put up a number of houses for us, both in Staffordshire and Scotland. We have every reason to be highly satisfied with the style and quality of their work, especially as compared with that of others whom we have previously employed. Their charges appear to be reasonable.—BURTON."

From J. W. BURGESS, Esq., Architect, Chislehurst, Kent.  
"Gentlemen,—I am exceedingly pleased with the Conservatory you have erected here."

## ECKFORD'S CULINARY PEAS,

SENT OUT AND SOLD BY

WILLIAM BULL, F.L.S.,

536, KING'S ROAD, CHELSEA, S.W.

**BARONESS** (Eckford).—A splendid main crop wrinkled Pea attaining a height of 4 feet, and bearing a profusion of large square-ended pods, filled with fine Peas of first-rate quality; it is of robust habit, with foliage of a bright green colour. In sealed Pint Packets, 2s. each.

**EMPERESS** (Eckford).—Awarded a First-class Certificate by the Royal Horticultural Society. A magnificent wrinkled main crop Pea, of robust habit and vigorous constitution, the growth reaching a height of about 5 feet. The pods, borne generally in pairs, are of large size, with square ends, and are well filled with 6-7 very large Peas of a rich sugary flavour. In sealed Pint Packets, 2s. each.

**VULCAN** (Eckford).—A fine dwarf late main crop Pea, of good robust constitution and free branching habit, growing about 18 inches high, with very dark green foliage. The pods, are produced in the most prolific manner, each containing 7-8 fine Peas of a bright green colour and delicious flavour. In sealed Pint Packets, 2s. each.

**DIGNITY** (Eckford).—A magnificent main crop Pea, of robust growth, freely producing very long square-ended pods, containing about 8 large wrinkled Peas of superior flavour. This is a grand Pea for Exhibition purposes, and cannot be too highly recommended. It attains a height of 4-5 feet. In sealed Pint Packets, 1s. 6d. each.

**MAGNIFICENT** (Eckford).—Awarded a First-class Certificate by the Royal Horticultural Society. A grand main crop wrinkled Pea, of robust habit, growing about 5 feet in height, and producing in the most profuse manner large square-ended pods, containing 6-8 fine Peas of delicious flavour. In sealed Pint Packets, 1s. 6d. each.

**VICTOR** (Eckford).—A dwarf second early Pea of robust growth, attaining a height of 2½ feet, the pods being most prolifically produced in pairs, each pod containing an average of 6-7 large wrinkled Peas of exquisite flavour. In sealed Pint Packets, 1s. 6d. each.

**DUKE OF CONNAUGHT** (Eckford).—First-class Certificate. A most excellent, distinct main crop wrinkled Pea, attaining a height of 4-5 feet, producing in the most abundant manner, long, square-ended, bright green pods, well filled with 7 or 8 large Peas of very superior flavour Grand variety for Exhibition. In sealed Quarts, 2s. each.

**PROGRESS** (Eckford).—A splendid late variety, growing to a height of 5 feet, very vigorous and productive, bearing a profusion of dark green pods of medium size, well filled with 7 or 8 bright green Peas of excellent flavour. This extremely prolific wrinkled variety can be strongly recommended as a marked advance on those already in cultivation. In sealed Quarts, 2s. each.

Respecting Eckford's Peas Mr. Charles Penny, Gardener to H.R.H. the Prince of Wales, writes:—"Your new Peas are first-class is every particular, and I can confidently recommend them."

## ECKFORD'S SWEET PEAS.

**BOREATION**.—A very fine dark Pea, with bold stout flowers, the standard being a rich shining bronzy-crimson, the wings of a beautiful crimson-purple shaded with rose. In sealed Packets, 1s. 6d. each.

**CARDINAL**.—A splendid robust growing variety, producing bright, shining crimson-scarlet flowers, very distinct and handsome. In sealed Packets, 1s. each.

**DUCHESS OF EDINBURGH**.—A very distinct and beautiful variety; the standard light scarlet, flushed with crimson, slightly spotted with white; wings creamy-white; wings deep rose. In sealed Packets, 1s. each.

**INDIGO KING**.—The standard of this charming variety is of a dark maroon-purple, with clear indigo-blue wings. In sealed Packets, 1s. each.

**ISA ECKFORD**.—A most charming variety, the flowers being a beautiful creamy-white heavily suffused with rosy-pink. In sealed Packets, 1s. each.

**PRINCESS OF WALES**.—A lovely variety, shaded and striped with mauve on a white ground, in a most pleasing manner; flowers of great substance and perfect shape. It has been awarded a First-class Certificate by the Royal Horticultural Society. In sealed Packets, 1s. each.

**QUEEN OF THE ISLES**.—Very distinct and handsome; the large and stout standard being bright scarlet flushed and mottled with white; wings flaked and margined with rosy-purple. In sealed Packets, 1s. each.

**THE QUEEN**.—A very beautiful variety, the light rosy-pink standard being in charming contrast to the wings, which are light mauve. In sealed Packets, 1s. each.

**ECKFORD'S MIXED NEW SWEET PEAS**.—This special strain of mixed Sweet Pea is saved from choice named and unnamed varieties of Mr. Eckford's raising. These are of various colours, and the mixture includes many of great merit. In sealed Packets, 1s. each.

### ST. AUDRIES.

AT the spot where the Quantocks terminate between the end of the ridge and the Bristol Channel, is the village of East Quantoxhead; and, less than two miles distant, under the shelter of those famous hills of Somerset, lies West Quantoxhead, a little village with a beautiful park sloping to the sea, and enclosing within its pales a handsome and costly modern church, and a mansion well placed and pleasing to look upon—the pride of the country-side. This is St. Audries, the residence of Sir Alexander Acland Hood, Bart.

It is not surprising that Washington Irving should have been charmed with an English country-house, so delightful and retired, and yet, like Audley End, in full view from the high road. In his graceful description of St. Audries, Irving spoke of "vast lawns that extend like sheets of vivid green, with here and there clumps of gigantic trees heaping up rich piles of foliage; the solemn pomp of groves and woodland glades; the brook, taught to wind in the most natural meanderings, or expand in the glassy lake."

The site is ancient, the house modern—built on the foundations of several predecessors. There was probably a St. Audries manor-house here in the century of the Conquest—there has certainly been a house here for at least 600 years. In the present century the place has been in possession of several owners, whose term has been short. The last of these fugitive possessors sold it to Sir Peregrine Acland, Bart., in 1836, and it passed to the present owner by his marriage with Sir Peregrine's only daughter. Both these latest owners added to the house, which contains many works of art and valuable paintings, including Turner's picture of Rose Hill, the residence of the famous Mr. Fuller, M.P. for Sussex, Lady Acland Hood's great uncle. I must not dwell on these matters, but perhaps I may mention that, among the curiosi-

ties of St. Audries, Sir Alexander Hood possesses a singular memento of a most remarkable experience in the married life of one of its former owners. The relic explains the business precisely and concisely. It consists of a glass case containing the garments of three babies which on three successive Sundays were presented to Mr. Palmer, of St. Audries, by his prolific spouse, whom he had married rather late in life. The case stands beneath the portrait of the thrice made happy gentleman, and an inscription sets forth the dates of the three births, June 5, 12, and 19, 1480. It should further be stated that all these children were boys, and lived to be men, two of them becoming persons of some distinction.

There are both red and fallow deer in the park at St. Audries. The latter were gathered in groups around the house; the former seemed to prefer the high ridge of the Quantocks, which rises here abruptly above this well-sheltered domain. As I passed through the park, leaving the house on my left, I could see them on the hill above, tall, stately fellows, their figures showing large against the sky-line. There were several stags in close company, tossing their heads defiantly, for the period of the year (October 20) is the season of their rivalry. At the time I have just mentioned there had been 12° of frost in the neighbourhood of London, and the beauty of the gardens had been sadly marred by the destruction of many of the more tender bedding plants, and of Fuchsias and Pelargoniums. Here on the west coast the same plants which home reports spoke of as having been already destroyed, were not in the least injured. The gardens attached to the entrance lodges of the park were particularly smart, and I ought to add that the lodges themselves are models of substantial, comfortable, and ornamental buildings.

I have mentioned that the mansion is placed immediately under the south-west front of the Quantocks. A little winding valley, enclosing most of the park, and about a mile long, runs down from the house to the sea. The sides of this "vast lawn of vivid green" are covered with timber and "rich piles of foliage." Some of the most stately of the trees stand near the house at the upper end of the valley, and beneath these the deer were gathered. I noticed that the *Arbutus unedo*—a very beautiful shrub when well grown—is particularly flourishing about here, and attains a great size. The *Laurostictus* is another characteristic shrub at St. Audries, and the *Eunonymus* is plentiful, finding, in a park bounded on one side by the sea, exactly the situation that suits it. The church, as I have said, stands near the house, within the park. It is an exceedingly handsome building, large enough for the parish, though small, and appropriately though highly decorated, "all marble within," I was told.

The natural beauties of this site would have been concealed by any considerable expansion of the ground devoted to shrubberies and gardens. St. Audries is exceedingly well kept up, and you cannot approach its precincts without perceiving in the tasteful beltings, handsome lodges and excellent cottages, that you are nearing the grounds of some great country house whose owner understands the duties of his station.

Mr. McCulloch, the head gardener, was not at home, but his foreman, Henry Martin, who seeks and deserves a better place, for which his character and knowledge well fit him, showed me through the grounds and hothouses, and through the conservatories opening into the living rooms. The gardening is well done. I was particularly pleased with the *Chrysanthemums* Mrs. Halliburton and Peter the Great, representing the whites and yellows, with many others. Some of these stood 9 feet high, in 18 inch pots, having been specially grown for a position in the hall. Another thing, most pleasing to reflect upon, I would gratefully refer to—the kind and liberal spirit which gives admittance to chance callers like myself, H. E.

## NEW OR NOTEWORTHY PLANTS.

### EUCHARIS GRANDIFLORA (Planch.) var. MOOREI, Baker.\*

THIS is a new variety of *Eucharis*, for our knowledge of which we are indebted to Mr. W. Moore, of Glasnevin, who received it from Messrs. Sander & Co., of St. Albans. It differs from *E. grandiflora* by its much smaller leaves, abruptly rounded at the base, and by its staminal cup being pure white inside, only marked, by a fine yellow line where the six filaments run down, and by the teeth between the filaments being larger and more acute. For the present I prefer to consider it a variety, and not a distinct species. J. G. Baker.

### MASDEVALLIA NIDIFICA, Rehb. f.

THIS lovely little gem flowered on the Continent with M. Ortgies, of Zurich, I believe, and with Herr Oberhofgärtner Wendland, of Herrenhausen. Now it has made its English debut with Mr. S. Courtauld, Bocking Place, Braintree, Essex. It is a very elegant, tiny plant, with leaves which have a very thin petiole and a cuneate, oblong, apiculate blade with a reddish hue, scarcely reaching 2 inches in height, usually shorter. Some wild-grown specimens of Consul Lehmann's are taller. The very thin, hard peduncles are reddish, with dark, purple spots. The cucullate bract exceeds the winged, purple ovary, has a purple keel on the back, and is whitish. The outer perigone, excepting the purple upper tail, is yellow, with five very conspicuous, indian-purple, longitudinal stripes. The lateral tails are yellow, longer than the body of the perigone, terete, very thin, the one ascending, the two descending. The body of the sepals forms a curved, sub-cylindrical mass, constricted between the chin and the free parts of the lateral sepals. Petals with a descending angular tooth, ligulate, with an oblique keel terminating in an apex of the denticulate, blunt, superior parts. Lateral laciniae of the lip half oblong, acute in front, covering with their apices the base of the median lacinia, which is very variable, varying from ligulate-acute to rhombic, and is often microscopically toothed in front; mid-lacinia light yellow, side-laciniae and disc white; column rosy, with purple spots.

This appears to have been met with since Professor Jameson by Consul Lehmann only, and I have no doubt that Mr. S. Courtauld's plant is of Lehmannian origin. It is exceedingly difficult to find this species, as this excellent collector informed me. H. G. Rehb. f.

## ARUNDINA BAMBUSEFOLIA.

ALTHOUGH the *Arundina bambusefolia* has the making of an elegant plant in it, even when not in flower, it is seldom met with in good condition in collections, probably, because it is usually not supplied with nearly enough water when growing, and is also, in many instances, placed in sunny situations, which, as a shade-loving plant, it resents. Those who have grown it best find that it succeeds admirably when placed in well-drained pans, a proportion of loam fibre being added to the peat and sand in which it is potted, and an unrestricted supply of rain-water given to it while growing. Even after the production of the handsome, rosy-petalled, and crimson-lipped flowers announces the termination of the growths, the plants, being terrestrial, should not be dried off. A shady corner in the intermediate-house suits it best. It is a native of Tropical Asia, and is allied to *Betula*. We are indebted to Mr. Weathers, Kew, for the sketch. (See fig. 87.)

\* *Eucharis grandiflora* (Planch.) var. *Moorei*, Baker.—Petiole 1–8 inches long, flat on the face in the lower half. Blade pale green, obtusely cuspidate, 6–7 inches long by about 6 inches broad, abruptly rounded at the base. Flowers about 6 inches an umbel; pedicels very short; ovary 3–4 inch long; perianth pure white; tube covered, under 2 inches long, cylindrical in the lower two-thirds, funnel-shaped in the upper third; expanded limb 3 inches in diameter; segments oblong, 1–1.5 inch broad. Staminal cup 1 inch deep, 1 inch in diameter, not at all green inside, faintly streaked with yellow along the decurrent filaments; marginal teeth lanceolate-deltoid, 1 inch long; free filaments 1 inch long. J. G. Baker.

## ORCHID NOTES AND GLEANINGS.

### ARACHNANTHE LOWEI.

I AM indebted to Mr. B. S. Williams, of the Victoria and Paradise Nurseries, Upper Holloway, N., for a fair raceme of this splendid plant, or rather one of the branches of the raceme. It measures 6½ feet in length, and bears thirty-two flowers; the three basal ones being orange, the remainder of the other kind.

I carefully examined each kind of flower, but found the pollen-masses and other organs equally perfect in each. The *raison d'être* of the two kinds of flowers on this remarkable plant seems as much of a mystery as ever. The floral envelopes are, of course, the parts of the flower which serve to attract insects for its fertilisation, and as the difference in the two kinds seems to be confined to these parts, the possibility suggests itself of some curious relation which may exist between the plant and its insect fertilisers, but this does not help matters much. The question seems one for investigation on the spot, if anyone should be fortunate enough to have that opportunity.

### MASDEVALLIA PLATTYRACHIS.

THIS very remarkable *Masdevallia*, described by me at p. 178, August 18 last, still continues to flower in the Kew collection, though the racemes are now nearly exhausted. Its remarkable flattened peduncles, in fact the whole structure of the flower, is remarkable, while the colour is quite distinct from any other I have seen. Its history, as already pointed out, is rather curious, and I have not yet heard of any other plant being in the country, or whether it appeared accidentally in a batch of other species from Costa Rica. I should like to point out that the name was incorrectly spelt at the page above cited through the accidental omission of a letter in the type. It should be as given above.

### CATTLEYA DOWIANA AUREA.

TWO specimens which I have received through Messrs. James Veitch & Sons will illustrate the variability in colour of this charming plant, which is now classed as a variety of *C. labiata*. The first is from the collection of Baron Schroder, The Dell, near Egham. The segments are of a very deep yellow, while the markings on the lip, which extend quite to the apex, are also of a very deep shade; the whole coloration being very brilliant. The second specimen came from the collection of Lord Rothschild, Tring Park, Herts. Here the segments are unusually pale, almost sulphur-yellow, the markings at the apex of the lip being also of a very pale tint. Behind this they run into light orange near the middle, and into reddish-purple near the base. This unusual paleness of the lip is believed not to be due to any weather influence, and is probably, like the former one, simply another instance of colour variation; not of much importance from a botanical point of view, perhaps, but a point which often enhances their value considerably as garden plants.

### SOPHERONITIS CERNTA.

THIS compact little plant, which is the species on which the genus was founded by Lindley, in 1837, is now flowering in the Kew collection, the plant being established on a block. It grows but a few inches high, the pseudobulbs measuring but about half an inch and the leathery oval-oblong leaves about twice this length. The peduncles are few-flowered, the flowers being of a light cinnamon-red, with the base of lip and the column orange-yellow.

It is figured in the *Botanical Register*, t. 1129, also in the *Botanical Magazine*, t. 3677. The species is a native of Brazil, and was originally discovered by Mr. William Harrison, a Liverpool and Brazilian merchant, growing upon trees at Botafogo, near Rio de Janeiro. By him it was sent to his sister, Mrs. Arnold Harrison, of Aigburth, near Liverpool, in whose stove it first flowered, in 1836. R. A. R.

ORCHIDS at FRINGILLA, SEFTON PARK, LIVERPOOL.

The month of November is not one in which flowers may be expected in great numbers, even in the most varied of collections; however, there are at present in the Orchid houses of Reginald Young, Esq., numbers of plants of various species in bloom.

A very rich collection is being formed by Mr.

Fine specimens of *Oncidium macranthum*, *O. ornithorhynchum*, *O. cheiroporum*, *O. maxillaria venusta*, were flowering profusely. A specially fine variety of *Masdevallia bella* was flowering, together with compact masses of the useful *M. tovarensis* and the pretty and interesting *Restrepia antennifera*.

*Cattleya gigas* was in flower, the width across the flowers being 9½ inches; also *C. gigas Sanderiana*, *C.*

*dens* is reported to be superior to the original plant in every point; it is figured in the *Orchid Album*, vol. vii., pl. 310. There are plants in the collection of C. E. Wallisii and C. B. crocata, and its sub-variety *rosea*.

The new and beautiful *Cattleya chrysotoxa* was just over; it was remarked that *C. Bungearothii* enjoys the treatment afforded it. Prominent amongst a fine batch of *Calanthes* is a fine form of *C. Veitchii*, which justly merits its varietal name *superba*. Several fine masses of *Cyclogyne cristata*, *C. c. Lemoiana*, Chatsworth, Trentham, maxima, and *C. Massangeana* were growing with much vigour, and will yield great numbers of flowers a few weeks hence.

Strong plants of *Angræcum sesquipedale*, *A. Sanderianum*, *Cymbidium Lowianum*, *C. eburneum*, *Miltonia candida grandiflora*, and *Oncidium Cavendishianum* were pushing spikes of commensurate strength. *Laelias* are great favourites with Mr. Young, and several excellent forms of *L. anceps morado* were observed in flower, which will be followed by others. One very compact specimen carrying nineteen, and another of the recently introduced *L. a. grandiflora* (true), thirteen spikes; *L. albidula* var. *sulphurea*, *L. furfuracea*, and *L. autumnalis atro-rubens* were very fine, and flowering as they do at this season of the year, these species should be very extensively grown by all who admire winter flowers. Warner's form of *Laelia gigantea* is one of the finest and rarest of the genus, and was represented by a vigorous specimen.

The *Dendrobiums* grown are many, and consist of fine specimens of *D. Brymerianum*, *D. Leechianum*, a remarkable one of *D. Ainsworthii*, *D. A. var. rosea*, *D. luteocarpum*, *D. Wardianum* Lowii, *D. Dearei*, *D. formosum giganteum*, *D. crassinode* var. *Barberianum*. All of these were showing a profusion of flowers.

Cypripediums in flower were *C. Spicerianum* magnificum, *C. Lowianum*, a 20-inch panicle; a fine mass of *C. Godefroyæ*, *C. barbatum pulcherrimum*, *C. Ashburtoniæ*, and *C. vexillarium superbum*. Noticeable amongst those not in flower were large plants of *C. Argus*, *ananthum superbum*, *Leeanum*, *Measuresianum*, *Druryi*, *Robelini*, *Morganeanum*, *Schroderæ*, *grande*, *Curtisii*, *Sanderianum*, *bellatulum*, *Selligerum majus*, and others.

Other Orchids of interest were the scarce *Oncidium Lanceanum* var. *Louvrexianum*, apical lobe pure white; *Vanda Sanderiana*, *Renanthera coccinea*, *Cymbidium Hookerianum*, and *Brassia Keiliana tristis*, all of which were in good trim. *F. Ashton*.

#### ANSELLIA AFRICANA.

Several varieties of this species of Orchid exist which vary considerably both in height and in the depth of colour of the flowers, but the variety called *nilotica* is probably the best, being dwarfier in habit, with darker and more distinctly marked flowers. It is also the most compact in habit. It does not, however, appear to be so plentiful as the typical form, examples of which are now flowering in the warm Orchid-houses at West Mount, Hillhead, Glasgow. Their reed-like stems—about 3 feet high, with numerous branched-drooping racemes of flowers nearly a foot long, and as much over—were conspicuous objects in the house. The flowers are freely spotted with reddish-brown on a yellowish-green ground. The flower-spikes are not very useful for cuttings, but if kept free from damp, in a moderately warm temperature, the flowers will last for a long time in perfection. Mr. Wilson grows his plants in plenty of material, and affords them much light and heat while making their growth, and obtains healthy, free-flowering specimens.

#### MAXILLARIA (LYCASTE) PICTA.

Although not so showy as some other members of the genus, yet, owing to the delicious perfume of its flowers, it is a favourite subject with many. The plant grows and flowers freely, and is neat in habit. The flowers, borne on moderately stout peduncles, are spotted and lined with purple-brown on a pale yellowish ground. Not unlike *M. acutipetala*, but

FIG. 87.—*ARUNDINA BAMBUSEFOLIA*: COLOUR OF FLOWER, PALE MAGENTA AND ROSE. (SEE P. 628.)

Young, and Mr. Poyntz, the gardener, is managing them very well. Amongst *Odontoglossa* a very fine *O. crispum virginale* was in flower, as well as the ordinary type of *O. crispum*. Many examples of *O. Pescatorei*, *O. Edwardii*, *O. Cervantesi decorum*, *O. Sanderianum*, *O. aspersum*, *O. grande*, were in flower, or pushing their flower-spikes. Several compact and well-flowered *Sophranotis grandiflora* were remarked, and also a fine plant of *Oncidium crispum*, with fifty-five flowers on a single spike.

*guttata*, and a splendid specimen of *C. Bowringiana*, very dark in colour, and out of one of Mr. Sander's importations. *Cattleyas* all round were in good condition; and those in sheath included some which are very distinct. A number of *C. Mendelii* were as yet unflowered, and a rich find in point of variety may reasonably be expected shortly. *Cattleya Eldorado* and its varieties are well represented, and formed part of the now famous importation of the Liverpool Horticultural Company of 1886. *C. Eldorado splen-*

differing from that species by being more incurved, and the petals and sepals not so acutely pointed. A good specimen, in a basket, was in flower recently at the Royal Botanic Gardens, Edinburgh. Like most other *Maxillarias*, the cool or intermediate-house is the proper place for it. *F. R.*

#### ODONTOGLOSSUM CERVANTESII MORADA.

A very fine and highly coloured form of this plant is now flowering at Allerton Beeches, the residence of H. Tate, Esq., jun. The plant is of easy culture, and the specimen here mentioned is suspended in the cool house. *F. A.*

### THE JENSENIAN SYSTEM AT CHISWICK.

The report of the small trial of the Jensenian theory with respect to the earth-protection of Potatoes from disease, furnished at p. 572, is both very interesting and valuable. It is interesting, because it exhibits something very practical done in a quiet unassuming way, and with excellent results. It is valuable, because it naturally points to means whereby the *Peronospora* can be successfully combated.

From the first announcement of Mr. Jensen's theory of high-moulding I have had considerable faith in it, but for the credit of that distinguished man it did prove unfortunate that several successive seasons were favourable to the Potato, and unfavourable to the disease; hence, trials of the protective earthing system proved little or nothing. Now that we have had a really bad season it would seem, with the exception of this single, somewhat late entered upon trial of the method at Chiswick, no one else had tested high-moulding, and yet the season proved to be exceptionally one in which the plan would be subjected to the severest test. That the trial at Chiswick was hardly a fair one because entered upon late, is certain, although in this case, unavoidable. Mr. Jensen has laid it down that the actual protective earthing should be done before disease spots appear on the foliage, or, at least, directly evidences of such are presented that would, according to his belief, ensure that the protective earthing was applied ere the fungus spores had been washed into the soil. Mr. Jensen stated that some 4 to 5 inches of soil should cover the forming tubers, to prevent the spores being washed through the soil into contact with the tubers. That may be an essential precaution, but I believe is not so necessary to the success of the protective moulding as is the prevention of the rush of moisture incidental to heavy rains, which in the ordinary method of earthing invariably flows into the basin formed in the soil by the swelling tubers through the cavity around the stems. That cavity is always existent, and is enlarged in windy weather by the motion of the stems. The foliage and stems of the haulm act as conductors of moisture, and a far larger quantity of rain is thus carried to the tubers than would be the case were there no stems, but only cavities. The Jensenian moulding system in throwing the haulm on to one side of the ridge, and obliterating cavities at the base of the haulm, diverts the rain into the furrows, and thus the tubers are left fairly dry. I had ample evidence during the past summer, when occasionally lifting roots of Potatoes after rain, of the way in which moisture will gather in the tuber basin. Then the soil exterior to the tuber basin would be fairly pulverised, and workable, but that about the tubers would be literally like mud. The swelling tubers naturally force the soil outwards, and others form a sort of basin, the walls of which are harder than the adjoining soil, and thus the moisture running down the stems is retained, and through its instrumentality the fungoid spores are brought into ready contact with the tubers. That some sorts escape disease appreciably under the same conditions of culture can only be due, I think, to the tubers possessing stouter skins, so that the action of the spores is to some extent resisted. On the other hand

it has been proved conclusively over and over that Potatoes grown in richly-manured soils suffer from disease with double severity compared with Potatoes grown on unmanured soil. The reason seems to be found in the rapid growth of tubers in the rich soil, promoting the development of thin skins and soft watery flesh. It is difficult to furnish any other theory in relation to this diversity of result. The Jensenian system of protective earthing seems to be entirely opposed to the theory put forth a few years since by Mr. Wilson, to the effect that *Peronospora* spores or sclerotia were wintered or stored in the seed tubers, and developed activity after the plants had made due growth in the summer. Were such the case it seems impossible that protective earthing could in any way check the activity of the spores. Then there is some belief that the spores are wintered in the soil, but, if that be correct, it is as difficult to understand how the protective earthing can secure for the growing tubers comparative immunity from harm. It does seem absolutely certain that the spores float about in the air, and settling on the foliage and stems, produce the well-known black spots, or are washed into the tuber basin and thus affect the tubers. But what becomes of all those spores which fall upon the soil remote from the tubers, or from whence they come, still seems to be veiled in uncertainty. If the protective moulding be widely tried next year under essential weather conditions, and it be found as generally successful as it has proved to be at Chiswick this year, very much will have been done to clear up the ignorance which still prevails as to the action of the Potato fungus. *A. D.*

### MARKET GARDENING AROUND NEW YORK.

We believe that much may be learnt by our horticulturists by a careful study of the methods adopted by successful cultivators in other countries, and probably nowhere is the business of market gardening better done than in the vicinity of New York.

Mr. Peter Henderson tells us that the reason for this is possibly to be found in the fact that New York, being the great depot for all the nationalities of Europe it gets from them the various methods there practised; in addition to this, and which may even have more to do with it, the high price of labour forces them to adopt plans entirely unthought of elsewhere. Certain it is that, as far as the practical work in use for cultivation is concerned, their methods in nearly all operations are mostly expeditiously accomplished.

In the immediate suburbs of New York, where the lands are rapidly being purchased for building sites, many the market gardeners pay as high as 100 dols. (£20 16s. 8d.) rent per acre, annually, and that, too, in most cases, without a lease. All such lands, of course, are cultivated to their fullest capacity, and even at present low prices bring an average gross income of over £200 per acre.

A great advantage is found in having the lands for growing vegetables as near to the city as possible. The saving in hauling of manure is one important item; but another, and one of far more consequence, is that, if the grower is near enough to the city to make two or three trips a day, in such a fluctuating market as New York, it is greatly to his advantage.

Whatever kind of horticultural product is grown—whether fruit, flowers, or vegetables—he that is nearest the market, other things being equal, has decidedly the best of it—so much so that in most cases it is considered by Mr. Henderson better to pay £10, or even £20 per acre rent, if within one or two miles of the market of a large city, than to get land ten or twelve miles away for nothing.

Many important improvements have in recent years been made in culture under glass, particularly in the methods in use in starting plants of Cabbage, Cauliflowers, and Lettuce; the old plan of sowing the seeds for these plants in the open air in September and pricking them out in October, and keeping them in cold frames, is gradually giving way to sow-

ing in greenhouses or hotbeds in February and pricking out in March, which gives a far healthier and nearly as strong a plant by the first week in April as those that have stood the winter.

The plan adopted in the preparation of the seed-bed appears well worthy of imitation. Only 2 inches in depth of soil is used, which is made up as follows:—The first layer, of about an inch, consists of good friable loam, run through a half-inch sieve. This is patted down with a spade, and made perfectly level and moderately firm. On this is spread about one-fourth of an inch of sphagnum (moss from the swamps), having been dried and run through a sieve, so that it is of the condition of fine sawdust. On the top of the moss the ordinary soil is again strewn to a depth of about three-fourths of an inch. This being levelled, the seed is sown very thickly and then pressed into the soil with a smooth board. On this fine moss is again sifted, thick enough to cover the seed only. The bed is freely watered with a fine rose. The plants are pricked out into hotbeds just as the rough leaf appears. The advantages of this method may thus be expressed:—When the seeds of most plants germinate, and they are thickly sown, the stems strike down into the soil, the roots forming a tap-root with few fibres, unless arrested by something. Here, then, comes the value of the one-fourth of an inch of sifted moss, placed three-quarters of an inch from the top. As soon as the rootlets touch the moss they ramify in all directions, so that when a bunch of seedlings is lifted up and pulled apart, there is a mass of rootlets attached to each, to which the moss less or more adheres. To the practical gardener the advantage of this is obvious; the tiny seedling has to begin with a mass of rootlets ready to work which strike into the soil at once. The advantage of the moss covering of the seed is not so apparent in the matter of a free-germinating seed, such as Cabbage, as in many others; but in many families of plants it is pronounced to be of the greatest value.

With regard to general culture, it need only be said that every year brings out some improvement in varieties. Within the past dozen years many important advances have been made in earliness and in the quality of the vegetables grown.

Quite a number of the market gardeners are now getting to grow Strawberries in conjunction with their vegetable crops, by following the pot-layering system, by which a crop of fruit is obtained in less than a year from the time of planting.

The question of fertilisers for the use of the market garden is now becoming a very serious one for the market gardeners in such cities as New York, where the manure from the stables does not increase in the ratio of the increase of the lands cultivated, as perhaps half of all the products grown are shipped to adjacent towns and cities.

Still there are few market gardeners who do not use stable manure, which costs, when fit to go on the land, from 2 dols. (8s. 4d.) to 3 dols. (12s. 6d.) per ton. This is put on in spring at the rate of from 50 to 75 tons per acre, to which is often supplemented half a ton of Peruvian guano or bone-dust, which is harrowed into the land after the stable manure has been ploughed in.

A great variety of fertilisers are used besides Peruvian guano and bone-dust, such as fish guano, dried blood, blood and bone fertilisers, together with superphosphate of lime; but the majority of cultivators prefer pure bone-meal or Peruvian guano to all others. *Garden and Forest.*

### CHEILANTHES.

THE most useful species of this genus are those which are sometimes found under a separate generic name, viz., *Myriopteris*, yet I believe they are better known as *Cheilanthes*, and are generally found under that name in nursery catalogues. Although the *Cheilanthes* can hardly be classed with Ferns useful for ordinary decorative purposes, the peculiar beauty of their somewhat slender fronds renders them indispensable in a collection; they also afford distinct shades of colour. *C. elegans* is one of the most

beautiful; the finely cut fronds are about 1 foot long and 2 inches broad, of a pale glaucous green on the upper surface, and densely covered with greyish-brown scales underneath. It is commonly called the Lace-Fern. *C. tomentosa*, a very distinct species, with rather long narrow fronds, not quite so finely cut as the above, thickly covered with silvery-grey scales or hairs, the whole plant having a greyish-green appearance. *C. hirta* (Ellisiana) is another desirable variety; it has larger fronds than either of the above, with a bright green surface, and brownish underneath.

All of the above may be readily obtained from spores, and are of free growth. They will succeed well in any ordinary compost; and a good loamy soil will suit them better than peat. They succeed best in an intermediate temperature, though *C. elegans* may be grown in the stove, and the other two in a low temperature, and although they like a fairly shady position they should not be grown under the shade of other plants or too closely together, or they will get drawn up, and when separated the fronds will not support themselves. A few young plants grown together in shallow pans make the best display; this is the best way to treat all of the smaller growing Ferns, especially if a succession of young plants can be obtained. A few fresh young plants grown together always have a better appearance than older specimens grown singly. *Pteris*.

## PLANT NOTES.

### PLANTS FLOWERING AT KEW.

The following interesting plants are now in flower in the Palm-house at Kew:—

*Bauhinia tomentosa* var. *glabra*.—This is one of the few species of the very large genus *Bauhinia* which are amenable to stove cultivation and which flower annually. It is a bush 6 feet high, with long switch-like branches and leaves 3 inches across. These are bilobed, as are all *Bauhinias*, and they always have a healthy look. The flowers are in pairs on the ends of the branches, each one being 1 inch across, and deep cupped, composed of five ovate petals which are canary-yellow in colour, the upper one having an additional blotch of purple. This species is figured in *Bot. Mag.*, t. 5560. It is a native of India, &c.

*Carludovicia rotundifolia*.—A large tuft of this stemless, tall-leaved species is a conspicuous ornament in one of the beds. The leaf-stalks are 8 feet high, 1 inch in diameter at base, half an inch at top, round, smooth, shining green. The blade is 3 feet across, palmate, split to the base into about four divisions, which are again split into narrow segments at the top. The flower-stalk rises from the sheathing base of the youngest leaf, and is about a yard high, as thick as the leaf-stalk, and it bears three overlapping boat-shaped sheaths, 8 inches long and 2½ inches wide, green, falling off as soon as they unfold. They enclose a spadix 6 inches long by 1½ inch through, which is covered with flowers, with long white filaments attached to them, and hanging down in the most graceful manner. Afterwards the fruits, or rather the whole spadix, ripens, curves downwards, and the fruits split away at the base, revealing the most brilliant scarlet and yellow colours. It is difficult to describe the peculiar character of these flowers and fruits. A figure has been made for the *Botanical Magazine*. An allied species, *C. palmata*, is the source of the well known Panama hats, which are manufactured from its leaves.

*Paulownia ceramensis*.—It is only rarely that the cultivated species of *Paulownia* flower. In the Palm-house at Kew the very large *P. odoratissima* has borne cones several times, and a male plant of the same species has only lately borne a magnificent inflorescence. *P. ceramensis* is a small kind when compared with that species. The plant now in fruit is 10 feet high, the stem naked, 1½ inch in diameter, covered with abortive spine-roots, and bearing at the top a crown of graceful green leaves, each one a yard long, and 1½ inch wide, channelled, the keel spiny

only near the apex, and the margins clothed with fine white spines. The fruit (they are really flowers, but one doesn't like to use the term for a solid cone, made up of little nuts) are in clusters on curving peduncles a foot long; each cone is 2½ inch long, by 1½ inch through, green at first, ripening to a rich scarlet colour of great attractiveness. This species is generally known in gardens as *P. ceramensis*.

*Licuala grandis*.—The large specimen of this is again flowering freely. It has bloomed every year for the last five years, but it has never ripened seed, although the flowers were carefully pollenised last year. The older name, viz., *Pritchardia grandis*, is that generally used for this Palm, although it is not a bit like a *Pritchardia*.

*Xanthosoma robusta*.—This grand Aroid attains gigantic proportions when liberally treated and allowed plenty of space. The plant now flowering has a stem 4 feet long, 6 inches in diameter, nearly erect, and bearing six leaves, the blade of which is 4½ feet by 3 feet, and the stalk 5 feet long, 6 inches in diameter at base, narrowing to an inch where it joins the blade. The flowers spring from the sheath of the young leaf, the scape being stout, 1 foot long, the boat-shaped spathe being 1 foot, and the erect spadix 8 inches, the whole not unlike a gigantic *Caladium* inflorescence. For large plant-stoves this Aroid is as useful as a *Musa*, and as easily grown.

*Begonia socotrana* and two of its offspring, viz., *B. John Neal* and *B. Adonis*, are now flowering side by side in the Begonia-house at Kew. As winter blooming kinds these are of first-rate excellence, for they bloom freely, remain in perfection several weeks, and are large flowered and brightly coloured. There is no reason whatever why these three plants should not be the forerunners of a race of winter-flowering Begonias as useful and beautiful as the race which owes its origin to two or three South American species. Everyone knows that the Messrs. Veitch set the ball rolling which resulted in the grand summer blooming Begonias, and it is to them that we owe this new and very promising race. *B. Adonis* is very much like an ordinary tuberous Begonia, except that it is flowering now when they are all at rest, and it retains its blooms longer. These are 1½ inch across, rosy-red, paler in the centre.

*Rhipsalis Houlettianus*.—There is only one really good garden plant among the numerous species of *Rhipsalis* known, and that is the above named. The stems are flat, like a knife-blade; each "blade" is about 9 inches long, sinuately lobed or toothed, with a flower springing from each sinus. This flower may be called a small white Epiphyllum-like flower. The stem is thin and cylindrical below, so that the flattened portion looks like a long leaf with a thin stalk. A well grown plant when in bloom is a pretty and unusual picture; such a plant may now be seen in the collection at Kew.

*Iponoea ternata*.—This is now flowering freely in the stove at Kew. As will be remembered, it was introduced a few years ago as "the white-flowered I. Horsfalliae," and was then named I. Thompsoniana. It afterwards proved to be the old I. ternata, of which Jacquin published a good figure in 1797 from a cultivated plant. Of course it is not nearly so attractive as I. Horsfalliae, of which a very large example, covered with bunches of bright crimson blossoms, may be seen in the same house with I. ternata. IV. II.

### STENOCASTRUM CONCINNA VAR. MULTIFLORA.

This is a neat small plant, attaining a height of about 2 or 3 inches. It should be treated as a stove-plant, and several of its tuberous rhizomes put into pans just below the surface of the soil. A mixture of peaty sandy soil suits their requirements, and this should be raised well above the rim, mound-shaped, with several small pieces of sandstone inserted here and there over the surface, between which the rhizomes may be planted. It is very floriferous, continuing in flower for a long period, the colour being of a lilac-blue. To propagate it, each small stem should be separated and put into small pots, or, if sufficient can be

procured, made up into a permanent pan and put into a close case for a few days, which is best done in the spring time; or the rhizomes may be cut into two or three pieces. This is figured in *Bot. Mag.*, t. 5253; but this genus, together with *Gloxinia* and a few others, is now placed with that of *Sinningia*.

### TORREYA MYRISTICA.

In any collection of Conifers the above-named deserves a place, not so much on account of its appearance as a tree, for as such it cannot be compared with many of the beautiful Pines and Piceas, but it is worth planting for the sake of its curious appearance when in fruit, especially from July to the end of October.

A plant in the collection here, about 20 feet in height and the same in diameter of branches, has borne fruit regularly the last eleven years, some years more abundantly than others; but this year I have never seen it better, many hundreds of its curiously nutmeg-shaped fruits, about 1½ inch long having been produced near the extremities of the branches, giving the tree a quite distinct appearance from any other Conifer.

A thick husk, similar to a Walnut, encloses the solitary fruit, and when ripe, peels off in the same manner. This husk has an unpleasant and peculiar smell, and the tree has, no doubt, on that account been called the Fœtid Yew.

It is a native of California, and is said to attain a height of 40 or 50 feet. It thrives well in a gravelly subsoil, and is very hardy, our winter not appearing to injure it at all. Its wood seems hard and durable like the Yew, but the trunk is small in comparison with the spread of branches. A. Harding, Orton Hall, Hunts.

## THE CHEMISTRY OF VEGETATION, IN REFERENCE TO THE GROWTH OF THE POTATO.

(Continued from p. 482.)

Now to get an idea of the passage of starch from the leaves to the tuber—which journey it cannot, it is said, perform as starch—let us for a moment, as we used to as little children, "just pretend." We will pretend there are groups of happy little beings in parties in a leaf made up of six Cs, ten Hs, and five Os, and they want to go a long journey exploring. They don't know what has become of little beings like them before. They all have hold of one another and they find, try how they will, they can't get away as they are. And then pretend that some good fairy tells them that if they get two more little Hs and one more little O to join them, they will be as if they were something quite different, and able to get about. People won't know them. And they do; and then they journey ever so far and ever so long. And then they get to a place where they want to stop. But some of them want to be as they were before. And the good fairy tells them that to do so they must say good-bye to two little Hs and one little O; and they do, and find they are just what they were before: and so they settled down in their new home, and—well—lived happily ever after, and never wanted to go any more journeys.

But although it is so commonly believed starch molecules cannot, or do not, go as such from one part of a plant to another, Sachs distinctly speaks of finding starch in the petioles.\*

Now although the grouping, or, as it is often called, the "linkage" of atoms in molecules of inorganic compounds has been arrived at in many cases with what appears to be tolerable certainty, the case is very different with organic. It has indeed been suggested that the composition of soluble starch may be  $C_{100}H_{72}O_{40}$ † (The relative proportions, 6, 10, 5, still remain.)

\* Marshall Ward's translation of the Vorlesungen edition of 1867, p. 329.

† Horace T. Brown and John Heron, "Contributions to the History of Starch and its Transformations," *Journ. Chem. Soc.*, xxxv., 1879, pp. 596–634. The reference is to p. 618.

Analysis with the combustion-tube, as mentioned above, which gives the carbon of a compound as carbonic acid, and hydrogen as water, makes known the total amount of carbon and hydrogen in the weighed quantity examined, but it does not tell anything about the molecular arrangement. This is work yet to be done.

The polariscope, to which brief reference must be made, has revealed to us that bodies having the same chemical composition (as regards weight proportion) may have very different physical properties. The natural inference is, that they are not identical in the form of their composition.

Perhaps the polariscope is not familiar to all cultivators, even under its trade name, saccharometer, which is one form of it. Most people, I suppose, have seen Iceland spar in an optician's window. There is generally a wafer or spot of colour under it. In certain directions this appears double. Now, without entering into questions of optical axes, or the wave theory of light in connection with the subject, what has been found can be done in this. Leaving out all details (which, with the theoretical explanation can be found in popular form in Mr. Spottiswoode's lectures to his workpeople),\* a slice of the spar cut in a particular direction is fixed in a tube which admits light on to it. There must be no other light in the room powerful enough to interfere with what has to be watched. Another slice is in another tube, so fixed that it can be turned round. The two tubes are placed so that the light, after passing the first, passes on through the second to some white surface. Some coloured light is used—say yellow. The light is seen on the white surface—a white wall, or sheet of paper. Then the further tube is gradually turned round, still kept in the position that the light enters it; but as it is turned, and with it of course the slice of spar, the light fades till it disappears. This takes place at half a full turn round.

If a glass vessel with flat sides containing dissolved sugar be then placed between the two tubes the light will reappear, passing on to the white surface. But a certain amount of turning of the tube will stop it again.

Different solutions are found to have different effects in this respect, and they have been carefully examined with apparatus, in which the amount of turning given is indicated on a scale marked off in degrees. They have also been examined with lights of different colours, and in this way their action on what is called polarised light is known. Now, with regard to the action of solutions of the carbo-hydrates it has been found that even those which have the same chemical constitution behave differently. Just as at a meeting it all depends on whether you are on the platform or in the hall which you call right or left, so it depends on whether you are in front of or behind the tube you would say it turned right or left. But it is conventionally agreed which is called right and left. The practical point is that some solutions give the light a "right hand twist" and some a "left hand twist." The second tube has to be gradually turned right or left to gradually cut off the light or let it pass again. I hope this makes the facts clear, though the language is far from scientific. But then, as regards using scientific language, we know what we mean by a Potato-apple, though it is not an Apple, and even "tuber" is not a proper word to use if it is rightly used for some plants other than Potatoes.

However, leaving out questions of "specific rotatory power," and the numbers used to express this, the broad fact is, that some turn the light to the right and some to the left. The plus sign (+) is used for right and the minus sign (−) for left. Dextro and laevo are sometimes used in naming combinations.

Now let us look at what has been found with regard to some of the carbo-hydrates.

Among the glucoses, all of which have the same chemical composition, as given above, dextrose (Grape sugar) is +, while levulose (fruit sugar) is −;

some others are + or −. Among the amyloids, starch is +, while inuline is −, and dextrine is very powerfully +. Temperature affects "rotatory power." Composition, as shown by weight proportions, is not, then, a full explanation of differences. Though the polariscope is used in testing the strength of saccharine solutions, I am not aware that it has been applied in starch manufacture.

What is the significance of such facts as these appears to have received but little attention. What their study may in time practically lead to it is impossible to guess. What is the physiological effect between + and a — sugar is not known. It has been wondrously suggested that babies cry when their milk has — sugar, and laugh when it has +. It has also been suggested there is a + Potato starch and a —, and that both are grown in Ireland, and give a right or left-handed light in which public events are viewed. This can hardly be considered a serious political suggestion, for there is no hint whether it is the Unionist or Home Rule districts that furnish the hypothetical — starch.

Before passing on from this part of our subject, there are one or two points to mention.

Though both starch and dextrine belong to the group amyloids, that is, they have the H and the O present in the same proportion, and both are + starch forms with iodine a deep blue compound, which dextrine does not. Dextrine is called British gum, and can be formed from starch when heated to about 150° C.

Cellulose, the colourless material of the woody fibre of young plants, has the same composition, but

FIG. 88.—CHLOROPHYLL SPECTRUM.

it behaves differently with sulphuric acid, or on boiling.

The addition of nitric acid and water to starch affords an example of a substitution product. The acid is  $\text{NO}_2$  added to starch  $\text{C}_{12}\text{H}_{20}\text{O}_{10}$ ; the result is  $\text{C}_{12}\text{H}_{19}\text{NO}_2(\text{NO}_2)$ ,  $\text{O}_{10}$ , where  $\text{NO}_2$  has substituted the place of our H.

Reference has been already made to some early observations on the effect of light on plants in decomposing the carbonic acid of the air, and so obtaining their carbon. The connection of this with the influence of chlorophyll has in recent years received considerable attention, especially with the aid of the spectroscope. Though the latest forms of this instrument are complicated and costly, the principle may be readily understood. It is easy to do as Newton did, let light into a dark room through a circular hole in a shutter, and hold a glass prism in the path of the light. An ordinary candelabra drop does very well. The coloured spectrum formed on a wall beyond is no doubt familiar to everybody. Wollaston used a straight slit instead of a round hole, and got his spectrum more clearly defined. What is seen is what is called in ordinary language "all the colours of the rainbow." In a spectrum caught on white paper from a good prism in strong light it is not difficult, with attention, to see there are dark shades or lines in various parts of the spectrum. It is on the presence of these lines that the work of spectroscopy is based. Quartz prisms or a wedge-shaped bottle containing a solution of bisulphide of carbon, is used instead of a glass prism; the source of light is in a lantern, and a tube with lenses collects and focuses the light on to a narrow slit. The electric light gives the spectrum complete, but different bodies are found on ignition to give only parts, in some cases very small parts of it, bright bands only here and there. The position and number of these bands

differs for different bodies, but is always constant for the same body. Hence it has been possible, taking the complete spectrum as a standard and marking it off into degrees (see fig. 88), to map the position of the bands and lines which occur in spectra from different sources. So characteristic are these that by looking at the spectrum any one familiar with this kind of work can tell what body or mixture of bodies is being used as a source of light. Different solutions also put in the path of the light are found to "cut out"—obliterate—part of the spectrum; and as the behaviour of so many has been studied it is possible to recognise certain solutions in this way. The applications of spectrum analysis at the present day are many—from reading the constitution of heavenly bodies to detecting the presence of minute quantities of bodies which ordinary analysis would fail to do. In plant physiology its two chief uses are a study of the effects of different portions of the solar spectrum, and of solutions obtained from different parts of plants.

It was to the development of the daguerrotype process of taking pictures we are largely indebted for the impetus given to the study of the action of different parts of the solar spectrum.

#### RECENT WORK.

There have been already mentioned:—

- a. The discovery of "fixed air."
- b. The recognition by Lavoisier that this is  $\text{O} \text{---} \text{C} \text{---} \text{O}$  and its being named carbonic acid.
- c. The recognition of the distinction between  $\text{O} \text{---} \text{C} \text{---} \text{O}$   $\text{CO}_2$  and  $\text{O} \text{---} \text{C} \text{---} \text{O}$   $\text{CO}$ .
- d. The many investigations of the composition of the atmosphere.
- e. The determination of the fact that plants obtain their carbon from the  $\text{CO}_2$  of the atmosphere.
- f. That intensity of light has an influence on the amount of carbon fixed. And
- g. That the colour of light has also an influence.

It now remains to notice the more recent work which has been effected with the refined appliances which modern science has devised. This work has in part confirmed and in part modified the conclusions drawn from earlier work. It has narrowed the questions still under discussion and given to them greater precision. Much of our increased knowledge of the various forms of solar energy has come from the subjects being taken up from a purely physical point of study. Starch and its modifications has also been studied from a purely chemical point of view. But it is with it only in connection with the growing plant we are at present concerned.

Recent work has mainly centered round the questions:—

1. What is the true function of chlorophyll? (chlorophyll is mentioned above under Sénénbier) and what is it?
2. What is the connection between chlorophyll, light action, and starch formation?
3. Is starch the first carbon compound formed in a plant?
4. What is the constitution of starch-forming bodies themselves?

Around these are clustered many subsidiary questions.

Memoirs and papers on these points are numerous, all of them, however, from foreign sources. Many of their questions overlap, and are treated in the same paper, and the work on the different lines has been going on more or less simultaneously. A retrospect in chronological order is therefore hardly possible.

As already mentioned, Sénénbier drew attention to connection of plant growth and coloured light. H. von Mohl first pointed out (1836) the common association of starch with chlorophyll, and though but vaguely, this was enough to direct attention to the subject. Subsequently Böhm, with improved iodine test, found a means of more easily determining its presence in chlorophyll corpuscles. From gradually extending examination of a wide range of

\* W. Spottiswoode, F.R.S., *Polarisation of Light: Nature series*.

plants it would appear that in some starch is not found at all, some other carbon compound instead being present.

Sachs, writing in 1882, claims that he was the earliest investigator to lay down that the first definitely established product of assimilation is starch. He says that in 1862 he came to the conclusion that the enclosed starch, which had been observed in the chlorophyll corpuscles by Nägeli and Mohl, is to be regarded as the first evident product of assimilation formed by the decomposition of carbonic acid, and gives references to his papers of 1862 in *Flora und Botanische Zeitung*. He points out that the action in a leaf is local. By placing one-half of a leaf in

the leaves is perhaps of secondary importance. The paper (of which an abstract has been given in English) is, however, of interest, since among other things it gives a description of the method of studying the chemical effect of light on cells with the help of the microscope. The plates show, magnified 700 or 800 times, the appearances of the cells as chemical changes occur in them, and he especially points out the care he took that the effects of heat and of light should not be confounded. Though he speaks of the relation between the action of chlorophyll and the formation of carbon compounds being wholly hypothetical, and not supported by experiment, it may be noted that Sachs, who has

intense enough to produce the green colouring matter of plants, is not necessarily enough to affect the decomposition of carbonic acid followed by formation of starch. It would be an interesting point to know the relative amount of starch-forming work effected by Potato leaves fully exposed, and by those shaded by others, as this might be found to point to the value or not of full-foliage plants.

The kind of light, or "part of the spectrum," which has the greatest influence on the decomposition of carbonic acid and assimilation of carbon, has been studied by Draper and by Pfeffer.\* Pfeffer has represented the results of his researches by a diagram (fig. 90). A is the band at the red end of the spectrum, and the letters follow to H in the violet end. The figures 1, 2, 3, are in the "infra red." The height of the thick line shows the varying amount of assimilation, and it will be seen that its maximum is between D and E, where the yellow and blue of the spectrum begin to mingle into green. Outside C and F the effects are but slight. In experiments with artificial cultivations, or in growing under tinted glass, such knowledge is of importance.

The method of development of starch-grains has been carefully studied by A. F. W. Schimper.† Even for those who would not trouble to read the paper the plate is of interest. But in no illustration does he refer to the Potato. He does, however, in passing, mention starch grains in the stem of the Potato.

Amid all the activity of work it seems strange that with our Potato crops, second in importance only to our cereals, the study of the formation of tubers is practically untouched. Beautiful Potatoes may be met with at shows; at certain places good table Potatoes may be purchased; but our general market supply is certainly not so good but that it might be improved, W. S. M.

(To be concluded.)

## THE APIARY.

BEEKEEPERS will again need reminding that, winter coming upon us, the long evenings may be usefully employed in reading up the subject, though books without practice is not advocated.

The month has been stormy generally, but the weather has been mild, and bees have had a great many flights. This is good for them, but as a consequence there is an immense demand on the stores, and woe betide the man who has not fed his bees! I know a cottager who acts on the "let 'em alone" system. Already he has about thirty stocks out of fifty dead. It is absolute nonsense to let them alone. If fodder were scarce would the farmer starve his cows? It is too late now to give liquid food, but candy may be put under the quilt just over the cluster, and this will save many a stock. Entrances may now be opened to their full width, as all danger of robbing may be considered at an end till spring, and air is beneficial to the hive in assisting to keep it dry. The bees should not be disturbed unless they are starving, and then only as above directed. If it is necessary to move hives, it had better be postponed till the bees are absolutely gone to rest. That will be in about another month. Bee.

## EXPERIMENTS IN HYBRIDISING BARLEY. †

THE author stated the results he has obtained by crossing *Hordeum vulgare*, *H. hexastichum*, *H. distichum*, *H. Zeocriton*, and *H. trifurcatum*, as made by him since 1834 on a large scale. He illustrates his subject with specimens. He described the precautions to be taken in such crossing experiments, and deduced the following conclusions:—(1). All the

FIG. 89.—SPECTRA OF CHLOROPHYLL.

FIG. 90.—DECOMPOSITION OF CARBONIC ACID, AND ASSIMILATION OF CARBON.

Dotted line = heat; fine line = brightness; thick line = assimilation. From a paper by W. Pfeffer, *Die Wirkung farbigen Lichts auf die Zersetzung der Kohlensäure in Pflanzen*, p. 46, b. i., "Arbeiten des Bot. Inst. in Würzburg," 1874.

atmosphere deprived of carbonic acid, while the other half is in ordinary atmosphere, there is no starch formed in the first half, while in the second there is. Similarly, if a portion of a leaf is shielded from light action, no starch formation takes place there. This limits the question of starch formation to the action of individual cells, and reduces the study of this part of the question to the action of light and decomposition of carbonic acid in each cell.

Pringsheim, however, in a lengthy paper published in Leipzig, 1881, urged that hypochlorin is the primary product of assimilation resulting from decomposition of carbonic acid. To the cultivator whose chief consideration is the formation of starch in the tuber, the question of details of its formation

since written, maintains that starch is the first visible product.

With regard to the chlorophyll itself, researches with the spectroscope have shown that it is probably not so simple a body as was at first proposed.

Fig. 89 gives the spectrum (A) of the extract of green leaves obtained by their solution in alcohol; (n) of the blue constituent, which is soluble in benzol; and (c) of the yellow constituent. The letters refer to the position of the lines (known as Fraunhofer's) so commonly used in mapping spectra, and the figures to Kraus' absorption bands.

But whatever may be the outcome of present research, the fact seems well established that the action of light with chlorophyll is essential to the formation of starch, and, further, that light which is

above mentioned Barleys may be crossed with facility, indiscriminately. (2). The hybrids thus obtained are very perfectly self-fertile; those produced from *H. vulgare* (fem.) and *H. distichum* (m.), and those from *H. vulgare* (fem.) and *H. Zeocriton* (m.) even cleistogamous. (3). The hybrids of the first generation partake in general of a middle shape between the parents. An exception to this rule was made by those of *H. nudum* (fem.) and *H. trifurcatum* (m.), a great part of which proved to belong to the not expected common intermediate form between *H. vulgare* and *H. distichum*. A few specimens belonged to the expected cornutum form. (4). The seedlings from hybrids obtained by self fertilisation are very various. Some new varieties were also secured. It was remarkable that the third generation of a cross between *H. vulgare* (fem.) and *H. Zeocriton* (m.) produced *H. hexastichum*. (5). In the present summer, a cross effected in 1884 between *H. distichum* (fem.) and *H. trifurcatum* (m.) produced a form almost completely without awns. *Abridged from "Nature," August 2.*

## THE HERBACEOUS BORDER.

AT p. 510, your correspondent, Mr. J. Horsefield, has given instructions respecting the above, and as his remarks are intended "for the benefit of those who are taking up the cultivation of these plants for the first time," it may be as well if a good representative list of first-class plants be given at the start, so as to encourage the growing of these plants, and make each newly-formed collection sufficiently attractive, that all who become acquainted with it may feel disposed to attempt something of a similar kind. Though it was not to be expected that Mr. Horsefield could, in his article, include all the good things to be found now among hardy perennials, yet it appears quite necessary that only good things should be named, and not those which, from a decorative standpoint, are valueless. If we would have the culture of hardy plants extended, even as far as their merits deserve, we must encourage new beginners, and not include any weedy subject which may hereafter prove disappointing. Some of those mentioned in the list referred to are only fit for a botanical garden—for example, the *Veratrum*s; others, as the *Tussilago*s, should only be found in out-of-the-way corners; for no plant could be more out of place than *Tussilago* fragrans would be in the front, especially in company with *Hepaticas* and *Gentiana verna*—the last-named quite unfitted for the beginner, and often very troublesome to the experienced; others, again, are misplaced, such as *Aquilegia corulea* and *Aster dumosus*; these two rarely attain 1 foot in height, and yet they are given as companions plants fully 3 feet high—for example, *Anemone japonica* (which is very often 3½ feet), *Aquilegia chrysantha*, *Asphodelus luteus*, and so forth, all of which are calculated to disappoint a beginner. And really there is an endless number of first-rate showy border plants not mentioned at all. Take the front row nearest the edge: here you may have *Snowdrops*, *Winter Aconite*, *Christmas Rose*, *Polyanthus*, bedding *Violas*, *Phloxes* amona, *Nelsoni*, frondosa, setacea, *Vivid*, *The Bride*, and others; *Saxifraga Wallacei*, *Cheiranthus alpinus*, *Gentiana acaulis*, *Pink Mrs. Sinkins*, *Iberis corifolia*, *Iris nudicaulis* and *I. pumila* vars., *Campanulas* turbinata, carpatica, and alba; while, if greater effect were needed in spring, *Chionodoxa*, *Erythronium*, *Triteilea uniflora*, *Crocus* in variety, *Anemone fulgens*, and such like, may be added, all these being not more than 9 inches high on an average. The next row, if rows are the order of planting, should contain *Lychnis fulgens* and *Haageana*, *Iceland Poppies*, *Aquilegia corulea*, *Anemone sylvestris*, *Aster dumosus*, *Trumpet Daffodils*, such as *princeps*, *Horsfieldi*, *spurius*, *rugilobus*, *Henry Irving*, *Golden Spur*, and so forth; *Orobus vernus*, *Heliolebor orientale* vars., *H. niger*; *Maximus*, *Geum coccineum* pl., *Iris Victorine*, *Arnebia echioides*, *Onosma taurica*, and the like. Behind these should appear *Senecio pulcher*,

*Aster bessarabica*, *A. longifolius formosus*, *Trollius* in variety, *Iris germanica*, and allied sections, a dozen good assorted kinds of about 2 feet high; a few clumps also of Spanish and English *Iris*, the double crimson form of *Paeonia tenuifolia*, *Helenium pumilum*, *Rudbeckia Newmanii*, *Anthericum* in variety, *Hammercallis Thunbergi*, double white *Rocket*, *Lychnis viscaria flore-plena*, perennial *Cornflowers*, *Potentillas*, a dozen good *Carnations* in variety, and many more. Another batch of increased height are single and double *Pyrethrums*, *Coreopsis lanceolata*, *Pæonies* in variety, *Gaillardias*, *Iris* *L'Innocence*, *Madame Chereau*, *Hortense*, *pallida*, *Walneri*, and *Imogene*; *Lilium dahuricum* in variety, *L. tigrinum* and its forms (these will attain 7 feet high and even more when established and well suited), *Hemerocallis flava*, *Stenactis speciosa*, *Helenium autumnale*, *Leucanthemum maximum*, some good and distinct herbaceous *Phloxes*, *Lychnis vespertina*, *L. chalcedonica*, *Doronicums*, *Oenothera Youngi*, *Rudbeckia purpurea*, and others. Another row may be planted with *Galega officinalis* and alba, *Pyrethrum uliginosum*, *Iris sibirica*, single and double *Sunflowers*, *Aster ericoides*, *Anemone japonica* alba, *Spiraea venusta*, *S. Uimaria plena*, *Dictamnus fraxinella*, *Tritoma uvaria*, *Iris Kœmpferi*, *Lilium candidum* and speciosum forms, and *Delphiniums*. While if plants of statelier growth were needed the want may be supplied with *Hollyhocks*, the taller *Delphiniums*, *Bocconia cordata*, *Iris ochroleuca*, *Lilium pardalinum* (a peat lover), *Tritoma nobilis*, *Aster novæ-anglie*, and the variety *rubra*, and the like; always allowing a greater space for the taller subjects to develop themselves. *Bocconia cordata* and *Pyrethrum uliginosum* make good isolated specimens, as do *Gynerium* and *Tritoma*.

In the foregoing we have a good assortment, as varied in colour as in height, and in the seasons in which they flower; and, best of all, all may be grown successfully by any one in fairly well enriched soil. Those who desire to get the full beauty of *Tussilago fragrans* should plant it in some out-of-the-way corner; give it a few soakings of liquid manure during the season, and annually in October pot up, say, six of the flowering crowns in a large 32-pot; water well, and place in a frame and shade for a few days; they make excellent pot-plants for conservatory or cool greenhouses, and, despite their dignity of colour, the flowers impart a delicious perfume, which renders them worthy of the appropriate name of winter *Heliotrope*; thus treated this variety is far too good to be cast aside as worthless. *E. Jenkins.*

## SPRINGWOOD, DARTFORD.

[SEE SUPPLEMENTARY SHEET.]

SPRINGWOOD, Dartford, in Kent, is the residence of T. Honychurch, Esq.; the gardens, which are of small dimensions, are kept in excellent conditions of neatness and order by Mr. H. Davis, the gardener, who is carrying out several improvements. The gardens are utilitarian to a degree, flowers suitable for cutting and decorative purposes receiving much attention, and consist of *Dahlias* (singles especially), *Tuberose*s, *Marie Louise* and *Neapolitan Violets*, which are favourites; *Pelargoniums*, *Primulas*, *Fuchsias*, &c., with which also the conservatory attached to the house was furnished when we visited it. One feature in the conservatory is the very fine plants of *Passion-flowers*, which are trained over the roof, the hybrid *Van Volxem* being particularly noticeable, flowering freely, and giving life and brightness to the whole.

Immediately outside this structure, and in an angle formed by it and the residence, is a fine vigorous specimen of *Magnolia grandiflora*, about 25 feet high, growing freely, and bearing a number of flowers in its proper season. The beds about the lawn are furnished, chiefly with sub-tropical plants and a few small Conifers, the lawn itself extending for about 100 yards in length, and at one side of it towards the far end is a collection of *Roses*.

After reaching the end of the lawn we emerge on

"The Wood," of which the illustration (see Supplement) is a representation, the view being taken at its limit. The wood consists of young trees of varied nature, as Birch, Lime, Elm, Beech, &c., with an undergrowth of Ivy and Brambles, which are allowed to grow freely. The walks are edged with a slight rockwork, in which are planted bulbs of *Snowdrops* and *Daffodils*, and throughout the rest of the ground the wild *Scilla nutans*, which forms a conspicuous object in the surrounding country, is to be seen cropping up in abundance. The walks are carpeted with moss, and the whole makes a quiet, cool, and pleasant retreat during the summer months.

The garden is a good type of a modern suburban residence, of which many examples may be seen around the outlying districts of London and other large towns.

## FORESTRY.

HEDGEROW AND FIELD TIMBER.—There are very few timber trees common to this country, whether native or introduced, which do not occasionally occur in our hedgerows. Speaking broadly, however, three species have the monopoly, viz., the Oak, Elm, and Ash. Of these, the Elm is by far the most common. This, no doubt, arises from the fact that the Elm propagates itself so freely from suckers, whereas the others are produced from seedlings only. Though but comparatively little is said of this class of timber in forestry publications, it is a subject which deserves attention, as from hedgerow and field trees a large proportion of the supply of home-grown timber is drawn, especially in this part of England. The few writers who touch upon the matter at all, as a rule, speak in a condemnatory sense. One cannot deny that there are certain well-founded objections to growing timber in these positions, but when the question is looked into fairly and dispassionately, it will be seen that a little judgment is all that is necessary to put the whole thing on a satisfactory footing. The greatest opponent of the cultivation of the hedgerow and field tree is, without doubt, the arable farmer, and in view of the many difficulties this gentleman has of late years had to contend with, his objections are entitled to consideration. Anything which can be done to remove any drawback to the successful growth of crops every reasonable landowner is ready to do.

*Removal or Lopping.*—Overhanging trees, either in the cultivated fields themselves or in the hedgerows between the fields, certainly do not tend to increase the productiveness of the land they overshadow, and where the surrounding conditions admit of it their numbers should be kept within such bounds as will be just sufficient to relieve the dreariness of a treeless landscape. In this, however, meeting his wishes the occupier should be very clearly made to understand that under no pretence whatever, would he be allowed to interfere with what timber remained, either in lopping, or in that very favourite amusement of driving nails into the boles of standing trees in lieu of posts. This extremely interesting and time-honoured abuse would chiefly occur where the side of the cultivated field was next to pasture land, or by the side of a public or private roadway. This assumes wider dimensions where trees grow between pasture fields, and the fences have to be kept intact. Bad, however, as this is, the lopping part is by far the more serious, as the ruin of thousands of trees, both as regards their ornamental and marketable value, is being annually accomplished through this pernicious practice being allowed to go on unchecked. There are, of course cases where there is no alternative but to lop off overhanging limbs—for instance, by the side of highways. This, if done carefully and neatly, and if the limb be removed as nearly as possible to the body of the tree, will only result in a single sound knot, and the operation will not need to be repeated. It is the senseless habit of continual lopping which is so lamentable, and which has so much to do with the relatively small prices obtainable for what would otherwise be good lots of hedgerow timber.

*Pastures and Meadows.*—I must now say a word with regard to pastures and meadows, as here the conditions are so different, and it is chiefly upon the fences which surround land of this nature, that we

have to depend for the bulk of this class of timber—in other words, for our supply of Elm. On all soils suited to it, in and around grass fields, the growth of the Elm should be encouraged. There may, perhaps, be some objection to such trees, as the Ash and the Oak being largely grown upon grass lands, as the pasture underneath is not improved by their presence. Fortunately there is no necessity for their being largely cultivated in these positions, as both of them produce clearer timber when grown collectively in woods and coppices. The Elm, however, is peculiarly the field and hedgerow tree, as it springs naturally from the soil, produce the most useful timber when partially or entirely isolated, and its leaves act as a manure to the grass underneath it.

*How to Improve Hedgerows.*—It can no doubt be said with truth that there is a great deal of Elm standing in our English fields and hedgerows which is neither good nor useful, but, whilst conceding this, I must point out that it is largely due to preventable causes. It arises from neglect on the one hand, and ignorant manipulation on the other. It cannot be expected that, in the case of a tree to a very large extent naturally reproducing itself by means of suckers, that no attention whatever will be necessary to preserve and direct, when small, the growth of the most promising young trees, and to remove the weaker and unnecessary ones, which, if left in existence, would only overcrowd and hamper the progress of what would, in due course, become good timber trees. The experience needful to make this selection properly is not difficult to gain by careful observation. Not unfrequently two or more large and thriving trees may be found upon a space which may almost be reckoned by inches. The great thing to be regarded when trees are starting into growth at close quarters like this is that each is equally vigorous, and has a fair chance of keeping pace with its neighbour. When trees are growing thus in close proximity, and it becomes clear that one or more is losing ground and is becoming dwarfed and stunted, the sooner it is removed the better. Where many years have been allowed to pass without attention to this important matter, much may be done even now to remedy the neglect. It cannot, however, be so easy or so satisfactory as a periodical inspection when the trees are young. By ignorant manipulation or interference I mean the plan of lopping of which I have spoken, and also the nailing, both very reprehensible practices.

In closing I would remark, that even when a slight loss occurs in crop, before removing a tree its prospective value should be weighed against any damage it may be, or supposed to be, doing. The consideration, too, of what our English landscape would be without its fairest ornament has its practical as well as sentimental side. *D. J. Yeo, Lynnham, Wilts.*

## PLANTS AND THEIR CULTURE.

*EPACRIS.*—To prolong the season of these useful plants, a portion of the stock may be hastened by giving it a few degrees more heat, selecting those with the flower-buds well advanced; strong forcing should however not be practised, or the flowers would lose in colour and substance, and much of their lasting properties when cut. A temperature of about 55° will be sufficient, by which, with a good light, airy position, flowers of fine quality may be produced. With an increase of temperature more water will be required, and it may occasionally be tinged with weak liquid manure, but the Epacris dislikes strong doses of manure as well as any superabundance of water at the root, the latter evil showing itself by falling leaves and poor flowers. At present the main stock of plants should be in a night temperature of not less than 45°, and great care should be exercised in watering the plants. They do best when the soil is kept uniformly moist, without being wet; and this condition of the soil it is not difficult to maintain if the drainage be good, and the soil firm, yet elastic.

*Epiphyllums.*—Those which are now resting after finishing their growth may, if required, be moved into warmer quarters, where with little further attention their flowers will soon expand. A shelf near the glass in a warm pit is the best position to bring them on, and if it be moderately moist, the plants will require but little water at

the root, and the flowers will open without any fresh growth being made—which is very desirable. As soon as the flowers are well expanded, remove the plants to a cooler and airier atmosphere. Small well-flowered pieces may be cut from the plants and used as miniature plants for table or other decorations. Such pieces need not be sacrificed, as after the flowers have faded they can be used to increase the stock of plants, either to be grown on their own roots or grafted on the *Pereksia aculeata* or other stock. The main batch of plants will be safe if kept rather dry at a temperature of 45°–50° for the present.

*Stephanotis floribunda.*—The present is a good season to thin out and cut away all weak and superfluous growths, cleaning and putting in order the plants for the next season. Where *Stephanotis* is grown as a plant in a pot, it sometimes does not flower satisfactorily. Of course this may arise from various causes, and one of the most frequent is that of not giving the plants a proper period of rest, but by keeping them in a warm moist house, they are more or less kept in a growing condition, with the result of much weak growth. The plants do not then flower so freely, and, indeed, I have found the plant flowers best when kept rather dry in winter, and in a temperature of 50° to 55°. This is more easily done with pot plants than with those planted out in a stove.

*Stocks.*—East Lothian Stocks when grown for winter flowering are scarcely excelled by any other plants. Those which were sown late and grown in pots for this purpose should be potted on as they require it, using sound loam with a little leaf-mould and sand. The best place to grow the plants is a cool frame with a rather steep-pitched roof, the pots to be plunged in cinders. Here, with attention to ventilation, the plants may stand during the winter, and may be drawn upon as occasion requires. For indoor work the white variety is generally preferred, and a scarlet form is also very good. *F. Ross, Bletchingley.*

## THE HARDY FRUIT GARDEN.

*BUSH FRUITS.*—When large quantities of fruits of Currants, Gooseberries, and Raspberries are required by the household, it is of importance that new plantations be made from time to time; therefore, when a break of bushes or canes begins to show signs of becoming worn out, a corresponding area should be planted with young bushes of stools without loss of time, and when these come into bearing the old plantation may be grubbed up. In small gardens the bush fruits are best when planted in quarters by themselves, as they can then be protected from the birds more economically than when distributed about the garden.

Currants and Gooseberries succeed in almost any kind of soil, but the Black Currant prefers one that is rather retentive, and a position that is shady and cool.

For Raspberries the ground should be heavily manured and trenched previous to planting; but the spade should not be allowed to be used amongst the plants afterwards for fear of destroying the roots near the surface. The autumn-bearing varieties are best planted so that they can be trained to a trellis, which may consist of four horizontal wires made secure at each end to iron or oakened posts. The height of the post needs not to exceed 5 feet.

The distances at which Gooseberry and Currant bushes may be planted are 5 feet between the bushes, and 6 feet between the rows; and Raspberries at 3 feet from stool to stool, and 5 feet between the rows. The best varieties for planting, taking Gooseberries first, are:—

Red varieties.—Whinham's Industry, Ironmonger, Nutmeg, Talford, Speedwell, Rough Red, Scotch, Warrington, Champagne, Slaughterman, Crown Bob, and Rifeham.

White, yellow, and green varieties.—Whitesmith, Transparent, Green Walnut, Pitmaston Green Gage, Champagne, Catherine, Criterion, Leader, Rumbullion, Ringer, and Yellow Ball.

Of Currants, Raby Castle, Cherry, Dutch, and Gloire de Versailles are the best reds; and the best whites are Transparent and Dutch. The best black varieties are Naples, Lee's Prolific, and Carter's Champion.

Of Raspberries, Baumforth's Seedling, Lord Beaconsfield, Carter's Prolific, Fillbasket, and Fastolf are the best red varieties; and the best yellow is the

Antwerp. The two best autumnal varieties are October Red and Belle de Fontenay. The first-named bears medium-sized fruits, very rich in flavour, and on that account of use in the dessert. The fruit of the last-named is very large, of a dark colour, and with some acidity, and consequently of much culinary value where Currants are kept till late.

A few red and white Currants should if possible be planted on a northern aspect, and for this purpose the White Dutch and Raby Castle Red are the two best varieties to plant.

*Planting.*—This should be pushed on without loss of time and while the mild weather lasts. Examine the roots of bought-in plants, and trim off the ends of all those that are broken or much bruised, and give them a mud bath if found to be dry. Avoid planting too deeply, but plant as near to the surface as is consistent with safety. In planting, spread the roots out at various depths, work some small quantity of fresh soil amongst them, giving the bush a gentle shake to and fro as the work proceeds, afterwards treading the soil firmly and evenly. A mulch of half-decayed manure may then be spread over the ground. All young stuff should have some temporary support to which the stem or canes may be loosely fixed to prevent wind-waving, the final tying being left till the spring months. Trees on walls should have the largest branches likewise loosely fastened to the same. *A. Ward, Stoke Edith Park.*

## FRUITS UNDER GLASS.

*THE PINE-APPLE.*—Fruiters should be kept at a night temperature of 65° to 70° according to the weather—if cold and windy let the lower figure be taken. Where any difficulty is experienced in maintaining the requisite temperature, a covering of Frigi Domo, or mats, should be used; the former is the handiest, and best. Allow a day temperature of 10° higher, and 5° more with sun-heat. Keep the bottom-heat steadily at 90°; examine the plants once a week, and water only such as are found to be dry. When the fruit is half coloured give no more water to the plant until the fruit is cut. Let the atmospheric moisture be wholly supplied by sprinkling the paths and surface of the beds, the vapour pans being at this season entirely dispensed with.

*Early Fruiters.*—A selection should be made from those plants which have been at rest for the past few weeks, and the selected plants plunged in the compartment prepared for their reception about the end of the month. In choosing those which are most likely to start without making any growth, it will be found that those which have the shortest leaves in the centre, and in which the latter is spread open, and which are thickest at the collars, will start into fruit the more certainly. A few of the short leaves may be removed from the collar, and the surface-soil pricked over with a sharp-pointed stick and removed down to the roots. Have in readiness some fibry loam to which a fair proportion of Thomson's manure has been added, and squeeze this firmly round the collars and over the surface of the ball, leaving about 1½ inch in depth for water. The bottom-heat for these plants should not exceed 90°, nor be less than 85°, when the plants are plunged in the hotbed, a good soaking of water should be afforded them at a temperature of 90°, and unless the weather be such as to entail hard frosts no more need be given until the plants are in flower. Do not syringe the plants overhead, but maintain a nice moist state of the air by sprinkling the paths and other surfaces. Let the night temperature be 65° or 70°, according to the state of the weather, 80° by day with 5° increase with sun-heat, when air should be admitted. Shut up about 1 p.m., and afterwards allow the temperature to run up to 95°. The fruiters to be started about the middle of the month of February should at present be kept at rest, and air admitted to them at all suitable times. For a night temperature 55° to 60°; by day 65° to 70° with sun-heat, and ventilation in fine weather.

*Succession Stock* should be examined once a week, to see that no plant suffers from an over-dry state of the soil. The watering must be done with care, using clear water. The night be done not exceed 90°, nor be less than 85°. Suckers recently shifted which are still growing, must be very carefully tended and all growth, as far as circumstances will permit, should be discouraged; bottom-heat of 85°, and a night temperature of 60° to 65° will be sufficient for them. *W. M. Baillie, Luton Ho.*

Advertisers are specially requested to note, that, under no circumstances whatever, can any particular position in the paper be guaranteed for advertisements occupying less space than an entire column.

#### SUBSCRIBERS TO

THE GARDENERS' CHRONICLE who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

W. RICHARDS, 41, Wellington Street, Strand, W.C.

NOTICE TO SUBSCRIBERS AND OTHERS.  
Post-office Orders and Postal Orders should be made payable at the Post Office, No. 42, DRURY LANE.

Now ready, in cloth, 11s. 6d.

THE GARDENERS' CHRONICLE,  
Vol. III., Third Series, JAN. to JUNE, 1888.  
W. RICHARDS, 41, Wellington Street, Strand, W.C.

### APPOINTMENTS FOR THE ENSUING WEEK.

#### MEETINGS.

WEDNESDAY, DEC. 5 { National Chrysanthemum Society :  
Floral Committee.

THURSDAY DEC. 6.—Linnæan Society.

#### SALES.

MONDAY, DEC. 3 { Dutch Bulbs, at Stevens' Rooms,  
Dutch Bulbs, at Protheroe & Morris' Rooms.  
Bulbs, Lily of the Valley, &c., at Small's Rooms.

TUESDAY, DEC. 4 { Nursery Stock, from sample, at Protheroe & Morris' Rooms.

WEDNESDAY, DEC. 5 { Roses, Fruit Trees, Shrubs, Border Plants, and Dutch Bulbs, at Stevens' Rooms.  
Lilies from Japan, Greenhouse Plants, &c., at Protheroe & Morris' Rooms.  
Dutch and other Bulbs, at Small's Rooms.

THURSDAY, DEC. 6 { Lillium auratum and other Bulbs, at Stevens' Rooms.  
Dutch Bulbs, at Protheroe & Morris' Rooms.  
Plants and Effects, at the Gardens, Kelsey Manor, Beckenham, by Protheroe & Morris (two days).

FRIDAY, DEC. 7 { Hybrid Cypripediums, from the collection of R. J. Measures, Esq., and other Orchids, at Protheroe & Morris' Rooms.  
Dutch and other Bulbs, at Small's Rooms.

SATURDAY, DEC. 8 { Roses, Fruit Trees, Shrubs, Border Plants, and Dutch Bulbs, at Stevens' Rooms.  
Dutch Bulbs, at Protheroe & Morris' Rooms.

Certificates at the Royal Horticultural Society.

AMONG the many points which require the consideration of horticulturalists in the thorough revision that is now going on is the system followed in granting certificates by the Floral Committee. These are now sought after for their commercial value—a matter of great importance to the trader, but one in which the Society, as such, has, or ought to have, no concern. The commercial value of a plant is something outside the Society's purview; still we must take things as we find them, and endeavour to amend them as best we may. Under existing circumstances it often happens that a certificate is granted on the award of a very small proportion of those present, the majority not voting. Frequently also it happens that a multiplicity of certificates is awarded to the same set of plants—say Dahlias, or florists' flowers generally—especially at the beginning of a meeting where one or two only would be adequate. Various methods of counteracting the injurious effects arising from this unsystematic and profuse certificate granting may be suggested. One is, that some means should be allowed to give the committee the power of indulging in second

thoughts, and of revising judgments made, perhaps on insufficient consideration, or imperfect evidence. Such power of revision might be exercised if the awards were always made at one meeting, subject to confirmation or rejection at the next. Again, it may be suggested that, in many cases, a sub-committee of specialists should report to the general body on the merits of plants shown for certificates, and that on the reception of their report the whole committee should vote. This plan is, we are aware, sometimes adopted now, but too often it is acted on somewhat capriciously although, it requires to be done regularly and systematically.

To avoid the unseemliness now often witnessed of a certificate being awarded on the verdict of two or three out of twenty or thirty then present, it may be suggested that no certificate should be granted unless it has gained an absolute majority of votes—that is to say, the vote of at least half of those present with one over.

The names of those present at the meetings should continue to be publicly reported, but in addition the names of the voters for or against a particular proposal should be recorded.

Again, the commercial test—if it be sanctioned at all—should at least only be applied in those cases in which it is fairly appropriate. The distinction may be difficult to formulate, but practically there would rarely, if ever, be any doubt at all upon the subject. Certain plants have, or are likely to have, a regular market-price, and may fitly be judged by those competent to form an opinion on such matters. Certain other plants have little present and possibly less prospective market value, because they cannot be, or are not likely to be, grown and propagated wholesale for commercial purposes, but only on a limited scale by amateurs.

The intrinsic interest and value of this last class of plants can only be indirectly estimated in pounds, shillings, and pence. That, however, affords no reason why they should be lightly esteemed by a society representing all departments of horticulture. Rather may we not say with truth, that commercial interests need no encouragement from the Society? The most important duty the Society has to fulfil is, on the other hand, to foster the interests of the science and art of horticulture generally, and specially as illustrated by the class of plants we have in view.

Bearing these things in mind, it may further be suggested that in all cases the grounds on which the certificate is awarded should be recorded. A First-class Botanical Certificate should, at least, rank as high as a First-class Floral or Fruit Certificate, though granted for a different purpose. As it is, Certificates by the dozen are awarded to Chrysanthemums, Dahlias, or other already well-known and popular florists' flowers, of which we have thousands already, while either no award at all, or, at least, no higher form of award is granted to novelties of far greater importance and rarity.

Take, for the sake of illustration, the Begonias. First-class Certificates are awarded to new varieties, year after year, and will continue to be awarded as long as the "improvement" continues. There is, of course, no objection to be raised to the judicious maintenance of this practice; our point is, that the original plants B. Veitchii, B. boliviensis, &c., when first introduced could have gained no higher award. Plants of that character when first exhibited are often treated as mere botanical curiosities, and either passed over or awarded a Botanical Certificate. This award, by some people, is looked on rather as a badge of dis-

honour than as a mark of distinction, and yet on consideration there is no one who will not see that the importance, even from a commercial point of view, of the original introduction, must be higher than that of the offspring from it.

The two classes of plants should, in fact, not be looked at from the same point of view, but each should be treated according to its merits, and the Botanical Certificate should take, at least, equal rank with the other. As it is impossible to make people appreciate things by telling them they ought to do so, we suggest that newly introduced plants, new hybrids, and, in fact, all plants not yet in commerce, and not belonging to groups in general cultivation, should be subjected to the examination of a special sub-committee of experts, chosen from any or all the three committees, and who should be empowered to grant Botanical Certificates. After all, much must depend on the wide, if not necessarily deep knowledge, of the chairman, his broad sympathies and his tact.

PINUS PINEA.—The following notes sent by Mr. GEO. NICHOLSON, Royal Gardens, Kew, of the dimensions of the specimen at Kew, figured in our last week's issue, may be of interest. Height about 35 feet, spread of branches 40 feet, girth of stem at 4 feet from the ground, 6 feet. Mr. NICHOLSON continues:—"I regret I am unable to give any details as to the age or history of this particular tree. With regard to the two forms of leaves which are not unfrequently produced by some trees, it might be as well to refer those interested in the subject to the figure published in these columns for July 14, 1883, p. 45—which gives a better idea of this peculiarity than any description. In an interesting account of the juvenile forms of Conifers—a *resumé* of which is given by Mr. HEMSLEY in the *Gardeners' Chronicle* of March 12, 1881, p. 333—published in REGER's *Gartenflora* for December, 1880, by Herr W. HOCHSTETTER, the Superintendent of the Royal Gardens, at Tübingen, that writer informs us that he has succeeded in fixing the juvenile forms of P. pinea and P. canariensis by cuttings. They form 'incomparably beautiful' bushes, with spirally arranged solitary needles."

SOCIETY OF AMERICAN FLORISTS.—We have now before us the report of the fourth annual convention, held at New York in August last. The gathering was evidently a successful one, and the record is both amusing and instructive. To our taste there is too much "voicing" in the report, and many things that doubtless were appropriate and effective at the time seem to us not worth reproducing in type. But tastes differ, and while the Americans are mostly good speakers, we "er—er—er" so much, as to have provoked the just sarcasm, that we of all people best illustrate the truth of the statement that to err is human!

EEL WORMS.—Much destruction is done to Cucumbers by the lodgment in the roots of minute worms. It is not only the Cucumbers that are affected but many other plants, while the leaves of cereals, of Carnations, and even of Orchids, are affected by creatures of this description. Dr. CHARLTON BASTIAN some years since published an elaborate treatise on the species and varieties; and certain Dutch naturalists have taken up the work. Dr. J. RITZENHA Bos is the latest of these, and he has just published a treatise in French on the "Anguillule de la Tige" (*Tylenatrix devastatrix*), and on the disease it produces. This worm occurs in the stems and leaves of various plants, but never in the roots. It is curious but satisfactory to read that decomposing organic matter, such as farmyard manure, acts injuriously on the creatures. A 1 per cent. solution of carbolic acid kills the creatures, as also certain other acids and caustic potash, all used at a strength of 1 per cent. Dr. Bos treats in succession of the disease in Barley, Onions, and Hyacinths.

## NATIONAL CHRYSANTHEMUM SOCIETY: Nov.

21.—A meeting of the Floral Committee was held at the Royal Aquarium on this day. Mr. E. SANDERSON in the chair, there being a good attendance of members. At the outset of the proceedings the following resolution was unanimously passed:—"That a protest be entered against a system that has been, and is still adopted by certain exhibitors, of sending up for adjudication flowers that have been re-named since imported." First-class Certificates of Merit were awarded to Miss M. A. Haggas; a golden sport from Mrs. Heale, an incurved flower of the finest quality that promises to take a high place as an exhibition variety, shown by Messrs. DAVIS & JONES of Camberwell, but obtained by Mr. T. E. HAGGAS, of Keighley, Yorkshire. To L'Autome, an incurved variety, said to be raised by a French amateur cultivator, the colour a charming shade of buff, with broad florets well arranged, and forming a full and handsome symmetrical flower. Shown by Mr. G. S. ADDISON, of Thornton Heath. To Alcion (reflexed Japanese), rosy-carmine, with a bright silvery reverse—a good sized full flower, of decided promise; from Messrs. H. CANNELL & SONS, Swanley. To Miss Wheeler, a Japanese variety of American origin, in the way of Edwin Molyneux, but not so good, though of much distinctness of character; the florets crimson, with a golden reverse; from Mr. T. BETTESWORTH, Barton Grange, Cheshunt. From Mr. RIDOUT, gr. to T. B. HAYWOOD, Esq., Woodhatch, Reigate, came large Anemone-flowered La Margaret, dull purple—a distinct and symmetrical variety. From Messrs. JAMES VETICH & SON, Royal Exotic Nurseries, Chelsea, came several new Japanese varieties, mainly raised by Mr. ALFRED SALTER, William Elliott, Mrs. H. Thompson, and Europe being the most promising. Messrs. DROVER, nurserymen, Fareham, had large Anemone-flowered Nilson, bright rosy-crimson, new in colour, and a very strong grower. Messrs. CANNELL & SONS had several new Japanese varieties, such as Unko and Mons. Baco, which the committee desired to see again. A stand of blooms of the useful white Japanese Florence Percy came from Mr. HOOKINGS, gr. to Sir W. THOMSON, West Moulsey; it promises to make a very acceptable mid-season variety. A sport from Ralph Brocklebank, a pale yellow Japanese variety, named Mrs. Bevan Edwards, came from Mr. BROCKLEBANK, gr. to R. BROCKLEBANK, Esq., Childwall Hall, Liverpool; it is of a rather deeper shade than the variety from which it is sported; the latter is itself a sport from the white Meg Merrilies. The Japanese, like the incurved varieties, are being somewhat largely added to by means of sports.

**ROTHAMSTED AND ITS WORK.**—The *Pall Mall Gazette*, under date November 22, has a portrait of Sir J. B. LAWES, Bart., and gives a short résumé of the work that is being carried on at Rothamsted, and says:—"Whoever seeks to learn of the marvellous workings of plant-life in all its forms must look for inspiration and guidance to the world-famous laboratory at the little Hertfordshire town" (Harpenden).

## "THE NATIVE FLOWERS OF NEW ZEALAND."

—We have already had occasion to mention this work, and have now to announce its completion with the third part. The portraits are faithful representations, well drawn and not exaggerated as to colour, but the absence of botanical detail either in the plates or in the text detracts very materially from their value. New Zealand plants have a *facies* or appearance of their own recognisable even in dried specimens, but which cannot be reproduced by the brush of the artist, still less described in words. The only means of appreciating this is to cultivate the plants, and fortunately many New Zealand plants, such as *Veronica Traversii*, *V. Hulkeana*, *Olearias*, and many others are hardy in ordinary winters in most parts of England, while in the south-west and in the corresponding districts of Ireland the greater part of the New Zealand flora might be grown. The present work will, we hope, stimulate many of our plant lovers to grow many of the beau-

tiful representatives of the New Zealand flora. Mrs. HETLEY's drawings have been reproduced in chromolithography by Messrs. LEIGHTON; and her book, which is dedicated to the QUEEN, is published by SAMSONS LOW & CO. We trust that the authoress may achieve such a measure of success as will induce her to continue her useful labour, for Sir JOSEPH HOOKER's *New Zealand Flora* is, we believe, not to be had except fortuitously, and must in any case be costly. With Sir JOSEPH HOOKER's smaller handbook and a good series of plates a very complete idea of the New Zealand flora might be obtained.

**PARIS EXHIBITION, 1889.**—One of the horticultural attractions at this will be the exhibit of Brazil. A pavilion is to be erected, and to be kept furnished during the exhibition with Brazilian Orchids in flower, among which are several of the most beautiful. The contract for the plants has been given to The Horticulture Internationale (Messrs. LINDEN) of Brussels.

**PENZANCE CHRYSANTHEMUM.**—The first show of this Society was held on the 21st ult. Competition was slack in several classes, and the 1st withheld. Groups, &c., were good, Mrs. HARVEY generally leading, and Mr. W. THOMAS was also successful, the latter having the best cut blooms. Messrs. SARSON and POPPIN were the chief amateurs. Vases, table decorations, &c. (ladies only) were keenly contested, and fruit was shown by Messrs. T. S. BOLETHO and E. BOLETHO.

**STOCK-TAKING: OCTOBER.**—The following is extracted from the tabulated summary of imports from foreign countries and British possessions for the month of October, published in the "Trade and Navigation Returns" by the Board of Trade:—

	1887.	1888.	Difference.
	£.	£.	£.
§ I. (A.) Articles of food and drink—			
duty free ... ..	9,536 018	12,359,622	+2,823,604
(B.)—do., dutiable	3,262,676	2,805,500	—457,176
§ VI.—Raw materials for textile manufactures (including Flax, Hemp, and Jute) ... ..	4,956,481	4,883,044	—73,437
§ VII.—Raw materials for sundry industries and manufactures (including wool and timber, hewn, sawn, split, dressed; vegetable materials, for paper-making, &c.)	3,337,498	4,157,309	+819,811
§ IX.—Miscellaneous articles (including Clover, Grass, Flax, Rape, Linseed) ... ..	1,180,440	1,119,560	—60,880
Total value of imports	30,550,307	35,022,135	+4,471,828

The following are a few excerpts from the immense mass of figures covered by the summary:—

	1887.	1888.	Difference
§ II. Fruit:—			
Apples, raw ... .. bush.	353,614	779,572	+425,958
Unenumerated, raw ... ..	681,380	709,549	+48,169
Onions ... ..	412,931	586,331	+173,400
Potatoes ... .. cwt.	76,632	61,311	—15,321
Vegetables, raw, unenumerated ... ..	Value £40,773	£51,166	+£10,393

The above figures, it is apparent, supply their own commentary to the appreciative reader.

**THE NEW PALM-STOVE IN THE JARDIN DES PLANTES, PARIS.**—There are, it appears, some matters which they do not "order better in France." The *Jardin* has a severe criticism on the new house, which, it appears, has been seven years in construction, and is, according to competent critics, a costly failure quite unsuited for its purpose of growing plants. A similar misfortune is of not infrequent occurrence where the construction of a conservatory is entrusted to the architect. The new building is

very massive, built upon arches, upon which the soil is to be placed. Regulation of heat, light, ventilation, and moisture—points of cardinal importance in the cultivation of plants—seem to have received very inadequate consideration, and the remonstrances of three successive Directors, *professeurs de culture*, unheeded.

**"L'ORCHIDIENNE."**—The second meeting of this Society was held on November 11, at Brussels. There were fifty-five plants contributed on this occasion. Messrs. MOCUS, Massange de Louvrex, Miteau, Wallaert (Secretary), and J. Linden (Chairman), with others, formed the Jury, and the awards were:—First-class Certificates to *Cypripedium Harrisonianum* polychromum, from Dr. Carnus; to *Ansellia africana aurea*, from Madame Gibe; to *Oncidium Forbesii* maximum, from the Count of Bousies; to *Vanda coerulesa* and *Cypripedium callosum*, from Madame de Cannart d'Hamale; and to *Cypripedium nitens superbum*, from Mr. Peeters. Second-class Certificates to *Zygopetalum crinitum* coruscum, from Madame Gibe; to *Oncidium Marshallianum* and *Odontoglossum grande fastuosum*, from Mr. Linden; to *Cypripedium Chantini* and *Epidendrum sceptrum*, from Madame de Cannart d'Hamale; to *Cypripedium tessellatum* porphyreum, from Mr. Peeters; to *Oncidium cheiroporum*, from Mr. Miteau; and to *Cypripedium Chantini atratum*, from Ms. Wallaert. First-class Cultural Certificates to *Cypripedium Harrisonianum*, from Mr. Moens; and to *C. Harrisonianum*, from Mr. Peeters.

**LINNEAN SOCIETY.**—On Thursday, December 6, the following papers will be read:—1. Dr. J. C. COSTERTUS on "Malformations in *Fuchsia globosa*." 2. Mr. B. T. LOWSE on "The Development of the Egg and Blastoderm of the Blow-fly." 3. Mr. G. A. BOULENGER on "The Reptiles and Fishes of Fernando Noronha."

**BOLTON CHRYSANTHEMUM SHOW.**—The second show in connection with the Bolton and District Chrysanthemum Society was held in the Bolton Town Hall, on Friday and Saturday, November 23 and 24. The exhibition, taken generally, was equal to the inaugural one, twelve months ago. There was a slight inferiority in the display of cut bloom as compared with last year, but this was counterbalanced by an increased entry in the larger classes of Chrysanthemums. A notable feature in the general collection was the abundance of fine specimens of horticulture and floriculture other than Chrysanthemums, these including a splendid Tree Fern, exhibited by Mrs. HASLAM, of Ravenswood; a *Croton Weismanni*, as a single specimen; a *Croton Hendersonii*, a *Cycas revoluta*, *Dracenas*, *Palms*, *Ericas*, and *Cyclamen persicum*. Messrs. DICKSON, BROWN & TAIT, of Manchester, exhibited a fine collection of similar plants, as well as Ferns, &c.; and Mr. J. WATKINS, of Withington, Herefordshire, exhibited a fine collection of Apples, consisting of seventy-five varieties. Messrs. W. CLIBBARD & SONS, of Altrincham and Manchester, offered for inspection a splendid collection of Chrysanthemum cut bloom in all varieties.

**CHORLEY CHRYSANTHEMUM SHOW: Nov. 23 and 24.**—The fifth exhibition was held in the Assembly-room of the Town Hall. Groups were very pretty; one of these was from Mr. G. Parks, gr. to Lieut.-Colonel Ffarington, of Wigan, who has carried off the prizes for this class at every exhibition the Society has held. The collection comprised fine *Crotans* and *Azaleas*. Mr. J. Rose, gr. to W. Simpson, Esq., Wigan, had a fine group of Chrysanthemums in variety. The cut blooms on the stands were of a superior order, and came in for much admiration. Mr. Kirkman, gr. to J. Stanning, Esq., Broadfield, Leyland, sending the best exhibition. The Orchids comprised some excellent plants, those shown by Mr. J. Eckerley being fine. Fruit was not numerous, but some black and white Grapes, shown by Mr. Middleton, gr. to R. Pilkington, Esq., Rainford Hall, were remarkably fine.

This exhibitor had a close competitor in Mr. W. Smith, gr. to J. Whitehead, Esq., Duxbury Hall. Among Apples, a fine group for culinary purposes was exhibited by Mr. Kirkman, and a collection of Apples came from Mr. John Watkins, Withington, not for competition. The vegetables were not numerous, but some fine Cauliflowers and Potatoes were shown. The amateur exhibits were very creditable.

**THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.**—A legacy of £50 has been bequeathed to this Institution by the late Mrs. SARAH CAMERON, who was the widow of the late Mr. GEORGE CAMERON, for many years the respected head gardener at the Duke of Richmond, at Goodwood Park, Sussex. He was a life member of the Institution, and died in 1870.

**NATIONAL ROSE SOCIETY.**—The annual meeting of this Society will be held at the rooms of the Horticultural Club, Hotel Windsor, Victoria Street, Westminster, on Thursday, December 6, at 3 p.m., for the purpose of receiving the Treasurers' accounts, electing officers for the ensuing year, sanctioning the arrangements for 1889, and general business. The annual dinner will take place the same evening at 6 p.m. at the same place. The chair will be taken by Dr. ROBERT HOGG, one of the Vice-Presidents of the Society, and a large attendance of members is expected.

**HARTLEPOOL SHOW:** Nov. 28 and 29.—The first annual exhibition of this newly-formed Society far exceeded the expectations of the committee. The chief exhibitors and prize-takers were Messrs. J. Short, Darlington; T. Pattison, A. Taylor, Robert Pool, Rink Gardens, West Hartlepool; J. Hall, gr. to Alderman George Pyman, J.P.; Mauder Bros., Seaton Carew; T. Gibbon, George Prince, W. Sawball, B. C. Laycock, W. M. Burns, and J. Bainbridge, all of West Hartlepool. There were also miscellaneous collections of cut flowers, fruits, and vegetables.

## ROSES.

### NEW ROSES.

It may perhaps be of interest to supplement "Wild Rose's" account of new Roses in 1888 (pp. 200-7), with a few notes on some additional varieties not therein mentioned, but which, nevertheless, appear likely to prove valuable. There is now little doubt that both this year and last will be recorded as considerably above the average in the novelties of interest distributed, and may compensate for the great dearth of Continental addition of value during the two previous seasons. The varieties generally distributed in this country for the first time last spring, include some very attractive Roses, and on the principle of last come first served, shall head the list:—

*Germaine Caillot* (Pernet fils-Ducher).—This beautiful Rose was figured in the *Journal des Roses* just a year ago, and the plate, allowing for the tendency in France to figure Roses in a state that, in this country, would be considered rather too full-blown, is one of the best that has been published in M. Scipion Cochet's periodical, and gives a very good idea of the erect habit, the beautiful colour, and the texture of the substantial petals of this most promising novelty. The reputed offspring of Baroness Rothschild and Madame Falcot (a cross, by the way, from which all these French hybrid Teas seem to be raised), *Germaine Caillot* follows the former in a robust, erect habit of growth, and in having abundant foliage right up to the flower-buds. The flowers are large, full, well-formed, and of a most delicate flesh-colour, and, judging from blooms seen under glass in the spring, and out-of-doors this autumn, the variety may be described as quite first-rate.

*Gloire de Margottin* (Margottin).—This brilliant hybrid perpetual has certainly a great many merits, even if the question of its availability for exhibition be regarded as an open one. On this point even, a favourable opinion has lately been expressed by a great authority, and for the rest, the variety is vigorous, free, perpetual, forces most easily, and has fragrant flowers of the most brilliant crimson colour.

*Gloire des Polyantha* (Guillot).—A very beautiful miniature pink Rose, raised from Mignonette, upon which it is a great improvement. It makes a most charming early forcing Rose in pots, and to plants so grown and exhibited by Messrs. Paul & Son, of Cheshunt, a First-class Certificate was awarded by the Royal Horticultural Society.

*Golden Fairy* (Bennett).—An addition to the pretty miniature ever-blooming Polyantha Roses, which, if its habit of growth be more compact and bushy than that of *Perle d'Or*, will be valuable, the flowers being of a similar tawny orange colour.

*Henriette de Beauvau* (Lacharme).—This, a climbing Dijon Tea, recalling in its deep red stems and dark foliage, Leve's Madame Eugène Verdier. The flowers are clear yellow, of good size and form, and the variety is likely to be useful both for exhibition and as a vigorous climber.

*Kronprinzessin Victoria* (Vollert).—This Bourbon comes from Germany, and is said to be a sport from *Souvenir de la Malmaison*. The flowers are very pretty, especially in bud and half-expanded, of a pale lemon tint deeper in the centre, but becoming nearly white in the full-bloom flower. It is recommended for forcing, and certainly was charming under glass in the spring, as it has been since out-of-doors.

*Laurette Messimy* (Guillot).—Only a China Rose, but so bright and pretty in colour as to be well worth growing. Most free and perpetual, the colour being of the brightest rose with a yellow shade in the centre of the flower—invaluable for bedding.

*L'Idéal* (Nabonnand).—This vigorous Noisette has been likened in a general way to William Allen Richardson, but the flowers are not of a self-colour as in that popular variety. Rose, yellow, and orange are among the mingled shades of the strikingly tinted flowers which in the bud state, will be in great demand for cutting. The plant is a climber, and a thorough autumnal Rose.

*Madame Hoste* (Guillot).—A beautiful Tea scented Rose that is likely to maintain the reputation of its celebrated raiser. The plant is vigorous and free, the flowers large, well formed, and of a delicate pale lemon shade, while they are carried erect, and abundantly produced in autumn. The firm of Guillot have raised and sent out many of the most beautiful of all the Teas, and there seems every probability that it will be amongst these that Madame Hoste will rank.

*Princess de Sagan*.—(Dubreuil).—A most brilliant crimson Tea, flowering abundantly early and late. If only the flowers can be grown large enough for exhibition, this variety will make a most striking addition in a box of Teas and Noisettes, for there is nothing dull or heavy about the colour, and the plant is a pure Tea.

*Red Pet* (Parker).—A China Rose that is always covered with rich crimson flowers of good form, though not individually very large. The colour becomes especially rich in autumn, and the variety is admirably adapted for bedding.

Of the Roses sent out the previous year it will probably prove that the hybrid perpetuals of value will exceed the Tea-scented varieties, although the latter are not by any means lacking in interest.

*Château des Bergeries* (Ledecheaux).—A pretty pale yellow Tea, growing well, and blooming freely, with flowers of good size and form. Some capital blooms of it were produced early in the season.

*Claudine Perreau* (Lambert) may be described as an erect-growing *Souvenir d'un Ami*, the globular rosy flowers being produced with very stiff stems upon a vigorous bushy plant, which is always well clothed with handsome foliage.

*Comte de Paris* (Lévêque).—A very promising rich crimson hybrid perpetual, with large, well-formed flowers; very free, of a vigorous habit of growth, and thoroughly perpetual.

*Dr. Antonin Joly* (Besson).—One of three probably valuable additions to the salmon-rose colours, of which the flowers are very large, full, and abundantly produced.

*Dr. Grill* (Bonnaire).—A most free-blooming and

charming tawny-orange Tea-scented Rose, whose flowers are well formed, and of good size. One of the prettiest of the French Tees of its year.

*Madame Bois* (C. Levet).—A Rose of Victor Verdier race, but fragrant, more vigorous than the type, and producing most freely very fine flowers of great depth, and with a magnificent petal, bright, fresh salmon-rose colour. A novelty that has been greatly admired in the garden in spite of the bad weather, and from which there were cut many beautiful blooms early in June.

*Madame Desir* (Pernet père).—Somewhat in the same line of colour as the preceding, but a Rose of very great fulness, that will be seen to greater advantage in a hotter season than the past.

*Madame Edouard de Bonnières de Wierre* (Lévêque) is a handsome and free dark-crimson hybrid perpetual, well formed, vigorous, and a free autumnal. Its chief fault lies in its name, which wants "editing." It has been suggested that Madame de Wierre should be adopted as a more reasonable and a sufficient appellation, and it may be hoped that the suggestion will be acted upon.

*Madame Etienne* (Bernaux).—Another rosy Tea of considerable promise, that seemed likely at one time to prove the best Tea of its year. The plant is perhaps rather lacking in vigour, but the flowers are of good size, well formed, and distinct.

*Madame Henri Perre* (Vilin) was one of the most conspicuous of the newer Roses at the exhibitions this year, being frequently very finely shown by Messrs. Paul & Son, of Cheshunt. The flowers are large, and very rich in colour, being of a deep velvety crimson, shaded with almost black, while the plant grows vigorously, and blooms well in autumn, and is beyond question a very striking variety.

*Madame Joseph Delois* (Guillot).—A most beautiful and refined variety of the highest type of beauty, the flowers being large, erect, pure white shaded with carnation in the centre, and freely produced both early and late. The plant is not a tall grower, but has the robust stiff growth of the Captain Christy race, and appears certain in a fine season to take a prominent position as a first-rate exhibition Rose.

*Madame Treve-Marie* (Liabaud).—A flower of the form of Marie Baumann—not so fine, but carried erect, very free, and of a charming shade of fresh rose colour, that proves attractive to almost everybody. Probably the best Rose sent out by its raiser since Madame Gabriel Luizet, ten years before.

These are the pick of the 1886-87 Roses, and with those previously described by "Wild Rose," must be held to constitute the most promising lot of novelties sent out for several seasons.

Of the 1885-86 varieties, Max Singer (Lacharme), said to be a seedling from *Rosa multiflora* and General Jacqueminot, is a very useful red, climbing Rose, producing throughout the season endless trusses of well-formed bright cherry-coloured flowers. Presumably "Wild Rose" considers it unnecessary to mention *The Bride*, of the same date, as being already generally known and admired; but it is worth noting that this Rose, the most valuable contribution that has yet been made by America, is already regarded as one of the best twelve varieties of all the Teas and Noisettes.

"Wild Rose's" remarks about the other Roses sent from America, and about *Pride of Reigate*, may be fully endorsed, as well as his recommendation of *Gloire Lyonnaise* (Guillot, 1883), Victor Hugo (Schwartz, 1884), Lord Bacon (Wm. Paul, 1882), especially valuable in the North, *Susanne-Marie Rhodocanachi* (Lévêque, 1883), a charming Rose that has become very popular; *Comtesse de Frigneuse* (Guillot, 1885), *Souvenir de Gabrielle Drevet* (Guillot, 1884), and *Viscountess Folkestone* (Bennett, 1886), a most lovely Rose, whose delicate flesh-coloured flowers, of great size and beauty, and of delicious fragrance, combined with a vigorous and ever-blooming habit, have already secured it almost universal admiration, and render it a Rose for everyone to grow, whether for its beauty in the garden, for cutting, for forcing, or for exhibition. Its con-

stancy, great size, and fine form will ensure its being in constant demand for the last-named purpose, and for the rest, its ever-blooming character and fine fragrance would be almost sufficient recommendation even were its flowers less exquisite than they are. *Theta*.

## FOREIGN CORRESPONDENCE.

### PINES AT RAVENNA.

I WAS at Ravenna for the second time some four years ago, and found not a single tree alive, bleached trunks in profusion, but no seedlings—as you suggested might be coming up. There is little chance of the forest being re-established, as the sandy soil is favourable to the formation of vineyards and not propitious for *Phylloxera*. Peasants were busy rooting up the dead trees and planting Vines. On my first visit I was struck by seeing in the forest numbers of Vines which seemed to have reverted to the wild state, and bore small sour black berries. *J. van Volxem*.

## THE KITCHEN GARDEN.

IN getting the soil ready for next year's crops, and which many gardens require for special crops, the aim should be, to get a soil of uniform quality and fair depth, and containing the elements necessary for successful growth. It is essential that the texture should be such that it may readily be worked in fine weather, and not liable to dry out quickly, or to retain, on the contrary, an excess of water. Therefore, the first thing to do is to obtain a good outfall for the drainage, and then lay in 2-inch drainpipes, not less than 3 feet deep, and from 12 to 20 feet apart, according to the nature of the soil, the former distance being for clay soils, and the latter for sandy. The main drain should consist of 6-inch pipes, and should have a regular fall throughout its length. This should be laid in first, and the branches arranged to join it at right angles if possible, with a good fall to the main, and before filling in the soil a good coating of small stones should be placed over the top of all the pipes to a depth of 6 inches. As a rule all soils with a subsoil of clay require draining, in order to cultivate them to the best advantage; but if they rest on gravel, sand, or are near to the rock, they are often drained enough naturally to meet all requirements. Where a so-called "pan" or concrete-like stratum is present at a short depth, this must be removed in all cases if successful cultivation is to be carried out. If drainage by pipes is from any cause impossible, much good may be done by opening drains as for pipes and making a V-shaped bottom to the trench, which may be filled with broken stones, brickbats, &c.; and if the soil be clayey fine coal-ashes, charred refuse, mortar rubbish, road grit, and burnt earth may be mixed with it—the last-named material especially adding to its fertility. Burnt earth is prepared by collecting some logs of wood with some small pieces to give the fire a good start, and when it is well alight give a good covering of turf over all, when it should be left until the fire begins to burn through at the sides; some coal refuse should then be thrown over it, and another layer of turf put on and allowed to partially burn through as before. The fire will now consume anything in the way of garden rubbish, soil, or turf, and if now carefully replenished with slack occasionally, a large heap of burnt earth will soon be made. It is a good plan to trench a portion of the kitchen garden each year, but only in very few cases is it advisable to bring the previously untouched subsoil to the top, and what is called bastard trenching is therefore that most commonly employed.

This is performed as follows:—Supposing the plot of ground to be operated on is 24 feet wide, a mark is cut down the centre with a spade, thus making two plots, each 12 feet wide. Two spaces, each 2 feet wide, are then marked off at the end of one of these plots, the good soil is then dug out clean, from the first space and deposited on the other plot of ground close at hand, or if there is room, just on one side. This saves wheeling the soil to the other end of the plot, which would have to be done if all was taken in one strip instead of two. As good dressing of manure, or whatever it is intended to be mixed with the soil, should then be spread all

over the surface for incorporating with the second spit; this layer will also often prevent the work being delayed by frost. At this season of the year especially, it is best to use all manure in a tolerably fresh state, as its manurial properties are apt to be weakened by the winter rains and snow before the ground is cropped. This having been done, the portion of manure on the next 2 feet space should be put into the trench that is open, and well worked in among the soil of the second spit; the good soil on the next space is then placed on the top of this, and the remainder treated as before. It is necessary to take especial care that each trench is of the same width as the first one, and if the plot is destined for small seeds in the spring, or the ground is adhesive in texture, it is a good plan to lay the top spit up in ridges as the work proceeds, and if any manure be considered necessary for the top spit, it may be added when the ridges are levelled down in the spring; this, however, is only required in very poor soil. By placing the bulk of the manure at the bottom of the trench the roots are induced to travel downwards, which gives the plants a better chance of growing well should the summer prove dry and warm. *W. H. Divers, Ketton Hall, Stamford*.

## USEFUL INVENTIONS.

### THE ORCHID FLOWER HOLDER.

IT is a fact well known to growers of Orchids that the plants are liable to be much reduced in vigour through their flowers being left on them too long after they have reached maturity. The object of this simple contrivance is to enable growers to relieve their plants by cutting off the spikes, putting them in the tubes filled with water, and inserting them in a natural position in the pots. The wire being pliable, the tubes can be placed in any convenient position, so that a natural effect can be obtained by showing the flower-spikes in conjunction with the plants, at the same time relieving the latter of the heavy strain upon them.

For floral decorators the Orchid-flower holder will be found most useful, inasmuch as, being made of any length, it will enable them to arrange for the distribution of any kind of flowers, which without it could not be utilised.

FIG. 91.—ORCHID-FLOWER HOLDER.

The inventor is Captain Maxwell, of Terrigles, Dumfries, and the seller is Mr. Alfred Outram, 7, Moore Park Road, Fulham, London.

**ROOT SHOW AT HEXHAM.**—On November 26, Messrs. W. Fell & Co., seedsmen, Hexham, held a root show. The display was very good. The results were:—For twelve Swedes, 1st, Mr. W. Charlton, Felt House, Wexford, Ireland. The heaviest nine Turnips were from Mr. J. A. Cowing, High Morley; weight, 10 stone 12 lb. Messrs. J. A. Cowing, J. Errington, Dukesfield, and W. Charlton, took other 1st prizes. Protests were lodged against the exhibits of Mr. Charlton, on the ground that the roots were not shown with the tops on, and these were upheld by the Judges so far as the classes of Swedes and Mangels were concerned. Under these circumstances the 1st prize for the best twelve Swedes was awarded to Mr. Glaister, Red Flat. A dinner in connection with the show was held.

## SCOTLAND.

### HORTICULTURAL LECTURES AT THE HERIOTT-WATT COLLEGE, EDINBURGH.

A course of lectures on horticulture has been instituted in the Heriot-Watt College for the session of 1888–89, to provide systematic instruction in the application of certain branches of science to the practice of gardening. The lectures are to be delivered by Mr. John Wilson, B.Sc., of St. Andrews, at 7 o'clock every Friday evening, from the 16th ult. to March 7, 1889. These lectures should prove a great boon to the large number of young gardeners who come from the country for employment in the numerous nurseries around Edinburgh during the winter season; and the fee, 5s. for the course, is so small that they all may take advantage of it. The lectures will also afford a valuable source of instruction to the gardeners more permanently employed in and about Edinburgh. The facilities which the Heriot-Watt College affords to all who are anxious to acquire information and instruction are inestimable to young gardeners who are so fortunate as to be within reach of such a valuable institution, where all branches of modern science are taught. Along with horticulture young gardeners can take a course of botany, chemistry, geology, drawing, mathematics, languages, or, indeed, almost any branch of learning in which he may wish to be instructed.

The subjects of instruction selected for the lectures during the present session include the following:—

1. General Principles of Horticulture.
2. Seed, Germination, Root and Leaf Action, Influence of Light and Heat, Soils, Manures.
3. Propagation by Buds, Cuttings, Layers, Grafting, Inarching. Effects of Stock on Scion. Sports or Bud Variation. Formation of Flowers and Fruit.
4. General Treatment of Plants. Planting, Training, Pruning, and its Effects.
5. Landscape Gardening. Formation of Gardens; Materials and Appliances.
6. Garden Structures; Heating and Ventilating.
7. Culture of (a) Stove Plants; (b) Greenhouse Plants; (c) Ornamental Shrubs, Alpine and Herbaceous Plants; (d) Fruit under Glass; (e) Hardy Flowers; (f) Culinary Vegetables.
8. Improvement of Plants by Crossing, Hybridising, and Selection. Fertilisation. Single and Double Flowers.
9. Town or Domestic Gardening, its utility in affording a healthy recreation.
10. Diseases of Plants, their cure or prevention. Insecticides, &c.

With such an excellent variety of subjects, in the hands of a skilful lecturer the course must be both interesting and instructive, and should draw many students from all classes of society.

The opening lecture of the course was delivered by Mr. Wilson on the evening of Friday, 16th ult., and the following gentlemen were present, among others, at the inauguration:—F. Grant Ogilvie, M.A., B.Sc., Principal of the College, Baillie Walcott, R. Lindsay, Royal Botanic Garden; M. Dunn, Dalkeith; D. P. Laird, A. D. Mackenzie, A. Milne; R. Bell, Morton Hall; R. Grossart, A. Laing, and a goodly number of young men who had already entered, or intended entering, as students. The Principal having formally opened the class, introduced the lecturer to the students in a few well-chosen remarks, in which he expressed his deep interest in the subject of horticulture, and anticipated a large amount of usefulness and success to flow from the lectures. Baillie Walcott, who occupied the chair, addressed the audience on the great educational advantages offered by the College, and its rise and progress since he attended its classes nearly forty years ago, pointing out the special value to gardeners of a course of study of the various branches of science connected with their profession, all of which are now so successfully taught at the College.

Mr. Wilson then proceeded to deliver his lecture, which was listened to by the audience with the closest attention, and drew forth their applause on several occasions. After indicating the various heads of study which it was intended to follow in the present course, he briefly alluded to the practice of gardening in ancient and mediæval times, and passing on to the consideration of the art as it now existed, he held that it might be fairly assumed that it was in as active a state of progress as ever it had been, and that there was a growing desire to help it still further on. The formation of the class, he said, was an indication of the progressive tendencies of the time. Depression of trade undoubtedly had done much to affect pure gardening, but not to such an extent as to justify the phrase, too often heard from faint-hearted men, that "gardening is done." Gardening must be subject to modification through the inevitable alteration of social conditions. It was for them to accept the inevitable, and to be fully equipped to make the most they could of the altered circumstances. The lecturer then narrated the subjects of study, making a few cogent remarks on each section, and bringing out the special points for the observation of the students with force and clearness.

In concluding, he alluded to several recent movements connected with horticultural education, specially referring to the scheme proposed by Professor Bayley-Balfour of instituting a course of lectures for gardeners at the Royal Botanic Garden, to which he wished every success, and the excellent practical work done by the Scottish Horticultural Association since it was established ten years ago.

Mr. Dunn, Dalkeith Palace, in moving a vote of thanks to Bailie Walcott for presiding, said that for some time it had been the aim of several of them, who were directly interested in the advancement of gardening, to establish a course of study, or horticultural class, such as had just been opened. Recently, Mr. D. P. Laird took the matter up, and, with the ready aid of the Principal of the College, matters were soon brought to a successful issue; and to Mr. Lindsay, Royal Botanic Garden, was due the credit of discovering the able lecturer to whom they had just been listening with so much pleasure and advantage. He thought all interested in the matter had good reason to congratulate themselves on the successful inauguration of the class. Mr. Laird and the Chairman having acknowledged Mr. Dunn's remarks, the proceedings closed.

#### AN AUTUMN VISIT TO A SCOTCH SEED FARM.

The trip from Glasgow to Rothesay *via* Wemyss Bay occupies about two-and-a-half or three hours, and carries the visitor through some of the most beautiful scenery in the West of Scotland. The natural attractions of the burgh itself, and the lovely crescent-shaped Bay of Rothesay, with its background of wooded slopes merging into the picturesque environment of the rugged hills of Arran beyond, tempt me to dwell a little on their charms, but the more practical object of my visit must be first attended to.

The offices and glass structures of Messrs. Dobbie & Co. are situated in the High Street, at no great distance from the boat-pier.

The premises consist of a number of detached gardens and fields, most of them walled-in, and extending to from 1 to 3 or 4 acres each, several of them being a mile or more distant from the others. The costs of management and working are of course increased by such an arrangement, but the power to isolate particular sorts one from the other is increased also, and the choice of soil and situation is all that could be desired.

Immediately in rear of the well-appointed offices is a walled-in garden of considerable extent, on one side of which is a range of glasshouses of about 400 feet in length, and a range of pits runs parallel with the former to the same length. The pits were filled entirely with young stock of selected fancy Pansies and Violas. The houses are used principally in spring for propagating and growing

young stock of named and selected florists' flowers, and Phloxes, Penstemons, Pansies, Violas, &c. The testing of Tomatoes, Cucumbers, and Melons, is also carried out during summer in them. I was fortunate in seeing the crop of Tomatoes, consisting of some seven varieties, which were growing in one compartment of the range under the same conditions, so as to test their relative merits. The following varieties struck me as being very good:—Earley's Defiance, said to be the earliest in cultivation; Canadian Victor, productive and excellent; and Dobbie's Prolific, which excelled the others in productiveness, in the size of its clusters of fruits, and in the size and fine colour of the fruits; some weighed in my presence turned the scale at from 8 to 12 oz.

The chief purposes to which the various divisions of this range are put in autumn is the drying of flower and vegetable seeds—a big task here, especially in a moist cold season. The whole space from roof to floor, except the pathway, is occupied with the flower-heads of French and African Marigolds, globe, quilled, and Victoria Asters, &c. The florets of all such are first trimmed closely with scissors, and two, three, or four heads are then tied together and attached to strands of stout twine strained from the dividing walls of each compartment, stakes being employed for intermediate support. The bunches are placed sufficiently far apart to prevent their touching each other. On the stages in other compartments were trays filled with seed-pods of Pansy Mignonette, Antirrhinum, Penstemon, and other plants which do not lend themselves to the bunching method of drying; but Leek, Parsley, and other vegetable seeds were being dried in a large shed, the internal arrangements of which were well devised for the purpose, notably the drying by means of flues. Skeleton shelves surrounded the sides and ends of the building, supporting trays for such things as may not be bunched and hung up, while on the roof and upper part of the sides, supports for strands of twine or wire in many tiers, were arranged for bunches of Leeks and such like. I cannot dwell on the details of cleaning and preparing the seeds for sale, which found employment for many workpeople at the time of my visit; it must suffice to say, that everything I saw of the harvesting of seeds, impressed me with the conviction that choice seed saving taxes the ingenuity, the attention, and resources of all who are engaged on it largely, and with a determination to excel.

In a run round the several gardens I found it was too late to see many of the flowers in good form; but the remains of African and French Marigolds, Antirrhinums, Mignonette—the latter Dobbie's Giant, bearing spikes, upright and sturdy, a foot long—satisfied me that the samples seen at the flower-shows during the season had not exhausted supplies of good things at home. So also with various specialties in vegetables with which the name of the firm is associated.

#### PEACH GROWING AT DUNDEE, STIRLINGSHIRE.

While I have travelled long distances this season to see hardy fruits in their best dress, and taken part in discussion as to the best methods of cultivating Peaches, I was unaware that objects of great interest and of high cultural order were within a few miles of me. At Dundee House, near Larbert, there have been Peaches grown for several years which have created considerable wonderment and given tangible proof that cultivation, when rightly mastered, can achieve results which are not generally supposed attainable, in Scotland at least, under any system of management. The kinds of Peaches referred to are Royal George and Noblesse; and when these are at their best they are second to none. Take three fine trees on a wall, 17 feet high, a Royal George 17 feet wide, bore 350 fruit of good size and perfect in colour; another of the same kind, 14 feet wide, had 300 equally good; and a Noblesse about the same size as the last-named (perhaps less), matured 190 really good-sized fruit. Now, when we consider that there are no advantages in climate, altitude, or shelter which can be taken

into account, cultivation must claim much credit. The position is low, and it is very subject to spring frosts. Nets are used for protection till after the fruit is set. The trees are kept thin, the roots near the surface, and a fair extent of run for the roots, over which light crops only are grown. The fruit was a month later in ripening this year than usual. Mr. Menzies, Mr. Harvey Brown's gardener, is not willing to take all the credit of growing such fine fruit in a season so adverse as the past has been; as he says, "Man, we have real good loam," and the roots are well looked after and kept near the surface. I thoroughly believe that root management has a deal to do with success in the cultivation of every plant. Climatic influence cannot be ignored, but healthy food, with all the functions in order to assimilate it, has a given result, which any cultivator may be proud of. *M. Temple.*

## ENTOMOLOGY.

### CALLIDIUM (GRACILIA) PYGMÆA.

DURING the years 1868–1874 there was published at Munich an elaborate catalogue of all the then described species of beetles (Coleoptera), in twelve volumes, by the Baron von Harold and H. Gemminger, amounting to 77,001 species, to which numbers at least 20,000 more must now be added of species either omitted by the authors of the Catalogue or subsequently described, raising the total list to about 100,000 species. Of this vast number as many as from 28,000 to 30,000 agree in a peculiarity in the formation of the last part of each foot (called the tarsus), which, instead of being formed of five free slender joints, consists of three dilated basal joints, of which the third is bilobed, forming a pair of pads having the real fourth joint very minute and united to the base of the slender fifth or claw-bearing joint. This peculiar structure prevails in the three great families of which the Linnean genera, Curculio (or weevils), Chrysomela (or plant beetles), and Cerambyx (or long-horned beetles), are the representatives; all of which are plant feeders, the dilated pads of the tarsi enabling them to keep a firm footing on the stems or leaves of the plants on which they subsist in the larva state. This remarkable generalisation is well represented in the numerous illustrations which have been published in our articles on the different species of beetles belonging to these three groups which infest plants or trees in one or other of their states.

We here give a further illustration of one of the long-horned species, *Gracilia pygmæa*, which, as the specific name implies, is comparatively of small size, being only a quarter of an inch long, of which several individuals were forwarded to us in the early summer of this year, which had occurred in considerable numbers in a newly-built house, where they were very destructive, as may be seen by the piece of wood figured on the left-hand side of our woodcut (fig. 92), which shows, in the shaded portions, the burrows formed by the larvæ (of which the head with its two small but powerful pointed terminal jaws is shown, greatly magnified, in the lower part of the cut (after Schiodte).

The larva is about a quarter of an inch long, slender in form, but with a much widened head; it is white, like the larvæ of the Buprestidae, with a few whitish hairs on the sides of the segments of the body; it is furnished with three pairs of small, slender four-jointed feet, attached to the three segments following the head; the antennæ are very small, the fourth or terminal joint resembling a small tubercle.

The beetle is narrow in form, rather flattened on the back, of a dark uniform reddish-brown colour, covered with a fine slight greyish pubescence; the antennæ are equal in length to the entire body, and are nearly cylindrical or filiform, slightly more slender at the tips.

The lignivorous larvæ of this beetle, according to Mons. E. Perris (*Larv. Coleopt.*, p. 466) is very

partial to Chestnut wood, but will equally attack young shoots of Oak, unbarked Osiers used in basket-making, Whitehorn twigs, the dead branches of the Spindle tree, Rose shoots, the wood of barrels, and even Briers, and when the period of its transformation to the pupa state approaches, it buries itself more deeply in the wood. In its ravages it is often accompanied by the larvæ of another longicorn beetle—*Phymatodes thoracicus*, especially in its attacks of the wood of barrels. The pupa is to be met with in April; it is quite smooth, without roughness or hairs of any kind, and the perfect insect appears about the middle of May. *I. O. W.*

## HOME CORRESPONDENCE.

Correspondents will greatly oblige by sending early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Photographs or drawings of gardens, or of remarkable plants, trees, &c., are also solicited.

**PRIMULA NIVEA.**—Since the publication of the synonym list, and on becoming a little better acquainted with the numerous species and hybrids of this genus, I now consider the proper place of *P. nivea* of gardens to be under *P. pubescens*. Whether the plant we grow at the present day is the original *nivea* I am unable to decide, but that the plant we grow has nothing whatever to do either with *P. viscosa* or *P. villosa*, anybody taking the trouble to examine them will see for himself. I am perfectly aware that *P. viscosa*, a common plant in gardens (under various names), is very variable, and it has been one of the parents of many beautiful hybrids; but the true plant as found wild in Switzerland, a plant of which was brought to Kew by Mrs. T. Thistleton Dyer, is as distinct from *P. nivea* as *pubescens* is from *Auricula*. The type *viscosa* is entirely covered with viscous hairs, quite sticky to the touch, and what I take to be a strong characteristic, it is totally devoid of meal; indeed, with meal it would not be viscous at all. On the other hand, *P. pubescens*, which is a hybrid itself (*hirsuta* and *Auricula*) is a much stronger plant than *viscosa*, with the large teeth of *hirsuta*, and the meal of the *Auricula*. *P. nivea* answers in every detail to the latter description, and as experiment has proved with seed from typical *pubescens*, one-third of which produced white flowers, answering in every way to the plant grown in gardens. As Mr. Douglas says, it never ripens seed in quantity, and the produce is never to be depended upon. A few capsules of seed saved by Colonel Beddome, and sown the same year, resulted in a full crop of purple *P. pubescens*, a plant of which was compared with our type, and answered admirably in every detail. The plant figured in the *Botanical Magazine* as *P. villosa* is *viscosa*, the true *nivea* being quite distinct, and an acknowledged species on the Continent. *D. Dewar.*

**PEARS.**—Mr. H. Markham states that he does not see clearly how it is possible to keep up a constant supply of fruit during the whole of the Pear season, year after year, with only twelve or fifteen varieties as selected and remarked on by me, but I can easily enlighten him on that head, and now assure him that it can be done, unless his provisos come in. These are that we cannot depend on the whole of those I mention cropping annually, which is very true, but when these fail, what about the others? And as I take it, that all are equal as regards free-bearing, and a spring that is adverse or fatal to one would be so to the rest, unless they happen to be exceptionally favoured with shelter. The sorts in my list are those that not only contain the best quality, as Mr. H. Markham admits, but they will, excepting the Williams, remain long in use, and by looking carefully over them and picking out for daily consumption the most forward, the one kind will more than carry on the supply till others come in. *J. Sheppard.*

—“F. M.” remarks that it would be scarcely safe for a gardener to limit his varieties of Pears to twelve or fifteen, but I feel sure that those who do so will give greater satisfaction to their employers or consumers of the fruit than they will by growing a greater number of kinds, as who, I would ask, would be satisfied with the flavour and quality of a Beurré Diel, Marie Louise d’Ucle, and Hacon’s incomparable after tasting a real Marie Louise or

Doyenné du Comice?—and as all ripen at the same time why grow such as are inferior? Beurré d’Aremberg is very good, but then it is not equal to Glou Morceau, which is in season with it; and here again the question comes, Why cultivate an inferior kind? As to Beurré de Capiaumont, and most of the others mentioned by “F. M.” as desirable, the sooner they make way for sorts of higher quality the better; and my advice to those who have them is to use them for stocks if not too old, and put grafts on them in March, taking the scions from Williams’ Bon Chrétien, Fondante d’Automne, Beurré Superfin, Marie Louise, Doyenné du Comice, Glou Morceau, Josephine de Malines, Bergamot Esperens, Beurré Rance, or Easter Beurré for latest supply, but the three last are not certain, as so much with them depends on the soil, situation, and aspect, which should be warm and sunny to have either of them up to the mark. *J. Sheppard.*

—I have been much interested in reading the discussion on the above subject in your columns, and heartily endorse all that “F. M.” and Mr. Markham have said as to the limiting of the number of Pears grown, in any one place or garden, to fifteen, as recommended by Mr. Sheppard; but my object in writing is to draw attention to the merits of that most excellent Pear, Durondeau, or De Tongre, which I find is not mentioned by either of your correspondents. This is, I consider, a first-class

FIG. 92.—CALLIDIUM (GRACILIA) PYGMAEA. (SIZE  $\times$  640.)

Pear, the tree being hardy in constitution, and when worked on the Quince stock it bears abundantly, and, in my opinion, is far away ahead of either Beurré Clarigee or Beurré Bosc. The fruits grow to a large size, and are very highly coloured, the flesh being tender, very juicy, and of excellent flavour. It succeeds well grown as a pyramid in warm localities, but in colder parts of the country it requires a wall with a south-western or western aspect. There are two other varieties of Pear I would likewise mention—the Seckel and Dana’s Hovey. The fruits of both kinds, I will acknowledge, are small in size, but what other varieties can surpass them for their honeyed sweetness? I am glad to see the Knight’s Monarch mentioned both by “F. M.” and Mr. Rust, as it is a capital Pear, and of good quality. Perhaps it is not generally known that there are two varieties of this Pear; but such is the case, and I grow them both here. The one comes into use about the end of the present month, and the other (which is the true variety) the middle or end of December. An excellent representation is given of both in the *Herefordshire Pomona*—the spurious variety on plate 4, and the true variety on plate 51; and I think I cannot do better than quote part of Dr. Bull’s explanation contained therein, as to the way in which the spurious variety became distributed:—“The error arose from Mr. Knight’s gardener accidentally sending wrong grafts under the name of Monarch to the London Horticultural Society; they were distributed over the country, and propagated by the nurserymen

for some years before the error was discovered, and this was created a confusion which has lasted half a century.” Monarch was raised by the late Thomas Andrew Knight, of Downton Castle, near Ludlow. *A. Ward, Stoke Edith Park.*

**MINA LOBATA.**—This beautiful climber, mentioned at pp. 542 and 547, has not proved itself hardy here; seeds were sown about the middle of March, the plants, which were transplanted in June, grew away vigorously, and were literally covered with trusses of beautiful flowers, being the admiration of everyone who saw them growing. An abundance of seed-pods were formed, but the early frosts cut it to the ground, and on examining the roots to-day (Nov. 19) I find them to be quite destroyed, so I think it may be fairly termed a half hardy climber. *John Scouse, Fletejor Park, Windsor.*

**FUCHSIA COUNTESS OF ABERDEEN.**—Notwithstanding the many fine varieties of Fuchsias which have been introduced in recent years, this fine novelty stands at present quite unique—both sepals and petals being almost pure white, there being but the faintest tinge of pink in them, but when viewed at a short distance they appear to be white. The flowers are not so large, nor have they so much substance as could be desired, yet as this is but the first of a new race of Fuchsias, it may not be long before larger flowers and other self-coloured varieties will be produced. Judging from what we recently saw of the plant in the gardens at Castle Newe, Strathdon, the plant has a neat and floriferous habit, and, as Mr. Pirie told us, it grew quite as freely as any of the others, of which he has a large collection. Indeed, there is little doubt but what the plant will soon be found in all good collections of Fuchsias. *F. Ross.*

**WALNUTS.**—Mr. J. J. Willis’ remarks in your issue of November 10 concerning the Walnut crop of this year I can fully bear out. My trees bore a good crop, but the shells never hardened; the outer green shell withered up, and we have been unable to find one good nut. The kernels which formed were soft and insipid. *R. C. Williams, Aberyst- with.* [The nuts spoken of by our correspondent and others were simply ill ripened owing to the wet summer. *Ed.*]

**JUDGING TABLE PLANTS.**—As I have won many 1st prizes for table plants at the best shows, I will write a line in reply to “Hortus.” It is not easy, without seeing the plants, to decide between the collections, but had I been judging, it is more than probable I should have hesitated before giving the 1st prize to either of the collections in question. There should be eight species in a collection of eight. Three *Crotons* and two *Dracenas* are far too monotonous. I seldom had even two of a kind—three, never. During the latter part of my exhibiting career, I think I may say I was rarely beaten in this class. Judges differ greatly, unfortunately, in their ideas as to the size desirable in table plants, and I have been disappointed to hear that though my plants were very beautiful, they were either too small or too large. The schedule should limit the maximum height—condition, quality, colour, variety, are the principal points with judges, but there are minor ones, such as the style of setting the plants up, neat and legible labels, clean pots, clean plants! Light-leaved, feathery, graceful plants should also be exhibited. I have sat at table, where I could hardly see my opposite neighbours, owing to the size and density of the plants decorating (?) the table. They are, however, going, if not gone out of fashion, and I am glad of it, for flowers are so much more delightful. To decorate a dinner table properly, which I invariably did with my own hands, requires taste, experience, and a knowledge of colour and arrangement, not, I am afraid, too common with those who undertake it. In my experience, ladies are the best judges in these matters. May I relate a good story against myself! Nobody enjoyed his own discomfiture at the time more than I did? It happened at Manchester. I had staged my six stove and greenhouse plants, and on looking round the various lots, some half-dozen in number, I satisfied myself that I was a good 1st. So I was. I found a certain friend’s collection however, badly staged, and I asked him if I might re-stage it for him. “Oh! certainly,” said he. I did it in a few minutes assisted by one of my men and friend “Smith,” shall I say? When I had done it, I found I had quietly put him 1st and myself 2nd, which turned out to be the case, and we enjoyed so hearty a laugh at my jolly innocence. Well, if these

lines catch the eye of friend "Smith," he will remember it perfectly. It shows how much depends upon good staging. I have lost many a prize in my time, through the bad staging of my men, when my plants were far the best. Alas! those happy days are past for me, but their memory is fresh and green, I am pleased to think. *T. M. Shuttleworth, Preston.*

— There has just occurred a similar case to that which "Censor" notes at our late Chrysanthemum show. On these occasions much discussion takes place and valuable time is wasted over the most trivial points, and it is time some one took up the matter in the horticultural press. We want a formula of judging to guide both exhibitor and judge, and such I am sure would be much valued by them, and would be the means of avoiding the heartburning so freely engendered among the exhibitors and others. *R. H. Poynter, Taunton.*

**LACHENALIAS FOR BASKETS.**—It would be difficult to find anything more adapted for growing in baskets for greenhouse or conservatory decoration than these. Every successful cultivator knows full well that they require plenty of light, and air on suitable occasions, and by so growing them they gain these two important items. By treating them in this way, it reduces the labour attached to their culture. The bulbs should be picked over, and those of a flowering age selected. Wire baskets lined with turfy pieces of loam should be used, pointing the bulbs between the wires at every 2 or 3 inches; and the centre of the basket to be filled up with a compost of loam, leaf-mould, and sand, finishing the planting by putting a few bulbs about the top of the basket. As soon as they commence to grow they should never suffer want of water, but when the foliage after flowering has become ripened, they should be allowed to take their rest and watering should cease; when ripened off they can be stored away in any dry quarter. If grown in this way, the baskets need not be disturbed for two or even three years—of course this matter depending upon the quality of the material used when making up the baskets. When in flower the baskets are completely hidden by the arching foliage. The Lachenalias most commonly cultivated are *L. tricolor*, *L. pendula*, and *L. Nelsoni*, all of which are equally suited for basket-work. *W. Harrow, Botanic Gardens, Cambridge.*

**WATERING.**—In the cultivation of plants in pots this is an important feature, as it is the medium by which food is conveyed to the plant. It is easy to see how growth may be influenced by the amount of moisture taken up, for no matter how much available food may be in the soil, it is practically useless unless there be a sufficiency of water to dissolve it. All growing plants should have an adequate supply of water. The various according to the character of the plant and the soil; but those plants which have hard wood and hair-like roots are more susceptible to fluctuations either way than those with larger roots, and which have generally more recuperative power. However, it is during the winter, and especially in dull foggy weather, that most difficulty is found in preventing loss by damping off, and to remedy which we keep them dry, and often kill their roots by so doing, as is sometimes the case with Primulas. These losses by damping usually arise from improper conditions of the air in the houses rather than from a superabundance of water at the root. At the same time it is quite possible for a plant to go off by reason of its getting too much water at the root, particularly where there is deficient drainage. Indeed the roots of some plants are readily destroyed by a water-logged soil, they are practically suffocated by drowning, and this brings us to see the advantages of giving waterings, such as will completely moisten the whole mass, and then disappear by means of the drainage at the bottom of the pot. The interstices of the soil being thus filled with water, are in turn filled with air, as the water becomes absorbed or passed out. It is therefore both watered and aerated by the operation when thoroughly dry, and only partially so when the water has not reached every part. The soil at the same time is more effectively fertilised by the combined disintegrating and solvent powers of the air and the water. It is therefore evident that although a good deal of discrimination is required in watering a plant, yet much evil may be prevented by acting decisively, and either doing it thoroughly, or not at all, and never giving dribbles. By adopting this plan I have seen where there was no other alteration in the course of cultivation followed, a marked improvement in a short time. As to water, that from a river, pond, or the clouds is better than that from any other source. Avoid

water artificially heated, unless in winter, by filling up the cisterns at night for the morrow's use; by so doing sufficient time will elapse to take the chill from it before using it. If the cisterns are provided with hot-water pipes, cut them off at the first opportunity; and also, when there is any connection with the water circulating in the pipes or boiler. Such waters, if not positively injurious, are certainly not in any way necessary or beneficial to plants. *F. Ross.*

**JUDGING AT WINCHESTER SHOW.**—Referring to the remark in your report of this show, that the decision in the large class for forty-eight blooms was considered by "some persons" to be a serious error, allow me to point out that there are generally two sides to a question. From enquiries made from competent and disinterested individuals I learn that the award gave very general satisfaction until late in the evening, when the 2nd prize man suddenly came on the scene. I understood that no previous complaint had been heard. I do not often take notice of remarks of this description when they concern myself, but I feel that this particular instance is one of much importance to competitors at Chrysanthemum shows, and should be brought before their notice in your pages. With all deference to your reporter I think he has not given a fair report upon this exhibit, for he points out the merits of Mr. Molyneux's blooms, but entirely leaves out their serious defects. The Japanese blooms are spoken of as being so much in advance of Mr. Flight's. They were certainly heavier in point of size, but on the other hand they were decidedly weak in point of freshness. In the incurved blooms, it is true Mr. Molyneux showed a splendid back row, but why does not the report give an account of the other rows?—for whatever the back row blooms may have been there was a great falling off in the front and middle rows, which contained many rough, uneven, and stale blooms; indeed, the whole of Mr. Molyneux's exhibit showed want of freshness, which was greatly enhanced by the contrast with the exceedingly fresh lot in the 1st prize stand close beside them. I cannot agree that Mr. Flight's Japanese blooms were "especially weak." Many of the blooms were as heavy as those in Mr. Molyneux's stand, while the whole exhibit was characterised by its exceeding freshness and uniform good quality. As I said before, this is an important decision, in which size of bloom and *prestige* in the exhibitor fade before freshness, which should be the great desideratum to aim at by any person who attempts to set a good example to his fellow exhibitors. I would ask would stale fruit or vegetables be tolerated at exhibitions?—then why should show blooms of Chrysanthemums? *Norman Davis.*

**WALL FRUIT TREE BORDERS.**—I quite agree with "F. M." that fruit tree borders are generally made too narrow, but the width they should be depends almost entirely on the height of the walls or the size of the garden they enclose, as where the latter is large, the borders should, as a matter of course, be in proper proportion. Taking the walls at from 10–12 feet, and the garden at about two acres, laid out nearly square, or a little longer than broad, a 15-foot border would be ample for any kind of trees, and would work in with the quarters and look very well. This is what ours are here, and the 5 feet next to the walls is held sacred to the roots, and is never touched by spade or fork, further than just to break the crust by the aid of the last-named tool, just before the mulching is put on in the spring, and that is done to let the water in when it rains, or the trees require it artificially, as otherwise much of it would be lost by finding its way off the surface or down the cracks in the soil. As to the treading, which "F. M." appears to object to, I rather like it, as I hold that borders for stone fruits, and especially Peaches and Nectarines, cannot well be too firm, as in that condition the trees growing in them make less wood, and that of medium strength and more solid and fruitful. With regard to borders being from 1½ to 2 feet higher next to the wall, the rise, in my opinion, should be ruled by the conditions of the ground, whether light or heavy, and also as to subsoil and natural drainage; for if the ground be light, such a rise would be bad for the trees in more ways than one, as it would lay the roots high and dry, and take from the height of the wall, and there would in that case be much loss of surface for training. Many years ago, when I took charge here, I found the borders all elevated far beyond what I considered they should be, and by degrees, as trees were replaced and could be removed, we lowered them, and continued on all round till the whole was done, and the improvement has been

great, as the trees suffer so much less from drought. In making the alteration I need hardly say that we did not take away the top soil, but cast that aside and removed the subsoil, which was a sandy gravel, and the pan or bottom of this was broken up and rubbish-heap stuff was worked in, which has been of great benefit to the tree roots, as now they can strike down and be independent of weather. As to drains, their utility depends on whether the rainfall can get away properly or on the natural lie of the garden, whether flat or wet; and if in this latter condition, or the subsoil be heavy and retentive, then drains that will carry off the superabundant water are necessary; but instead of placing them across the border, I should only have them along the front, as there, with proper falls and outlets, they would do all that is requisite for the welfare and health of the trees. In a garden that has a gravelly subsoil, or such as water can pass freely through drains are worse than useless, and here, except for carrying off water from the surface of walks, we have not one on the place, and not a particle of any kind of rubble or material under one of our trees. Like most gardeners we have to crop our borders, but, as I stated above, we do not go nearer the wall than 5 feet or so, and we only put light crops on, such as early Peas, Cauliflowers, Lettuces, Parsley, and French Beans, and use some for seed-sowing to raise plants for putting out during summer to yield the supply of vegetables. The digging we give the borders is light, and the manuring very moderate, and the little that the roots of the trees get out does perhaps more good than harm, as the severance of any strong ones leads to their making more fibres. *J. Sheppard.* [Our correspondent resides on a very dry soil, and in dry East Anglia. *Ed.*]

**LOBELIA CARDINALIS.**—This plant is much admired here for bedding purposes; but I find some difficulty in keeping the plants through the winter, either in a cold frame or cool-house. The plants rot in the middle during the winter, and, instead of being able to divide them into numerous plants in the spring, I find a difficulty in retaining even a small stock. I have tried keeping them dry, moist, and half-way between the two, but the results have always been the same. I have several times seen the advice—lift the roots, place them in cold frames, and in the spring divide the roots. Does your correspondent "J. S." find his roots rotten in the centre? I have found that the best way to keep the roots, through the winter is by pulling them to pieces at lifting time, placing them thickly together in boxes of moderately moist soil, and placing the boxes in a cold frame safe from frost. Early in April the plants should be transplanted to other boxes, or into the soil in a sod frame, for instance, whence they can be planted direct to the beds. We prefer the plants with single stems, as they can be more uniformly arranged in the beds in masses. Some of the plants, when in bloom, reach a height of 4 feet. The effect of such a bed, with well grown even spikes of bloom, when the sun shines upon it, must be seen to be realised. The bed is carpeted with *Antennaria tomentosa*, which forms a capital contrast to the dark-coloured foliage and bright crimson spikes of the *Lobelia*.

## SOCIETIES.

### EDINBURGH CHRYSANTHEMUM.

The third annual show of Chrysanthemums, under the auspices of the Scottish Horticultural Association, was held in the Music Hall, Edinburgh, on the 20th and 21st ult. It was opened by Councillor Colston. Mr. Thomson, Clonoflorens, in replying to Mr. Colston's remarks, said that, as it was intended next year to hold the centenary of the Chrysanthemum, and exhibitions in connection with it would be held in England, he did not see why they should not next year hold a great International Chrysanthemum Show. If it could be arranged that the Town Council of Edinburgh would award a Cup with the City arms upon it, he believed other gentlemen would follow suit, and such an exhibition of Chrysanthemums would be got up as had probably never been seen in the country. Councillor Colston, in acknowledging the motion, said with regard to the subject of the Cup that if a proper representation was made to the Lord Provost, magistrates, and Town Council, they would not be backward in considering it. At the dinner to the judges, over which

Mr. Thomson presided, further allusion was made to this subject, and the Chairman stated that a large amount could be raised without difficulty for such a show, and pledged his own firm to the amount of £5 towards it.

#### CUT BLOOMS.

The show was the best the Society has yet held, the entries in most classes being a considerable increase on those of last year. The success that has attended the efforts of the Council of the Association to meet the public desire for the popularising of the Chrysanthemum is creditable and gratifying, and proof also that the Royal Caledonian Horticultural Society erred when three years ago it declined to take the matter up. There was a marked improvement in the quality and finish of the cut blooms, especially the incurved varieties. The competition for a Challenge Cup offered by the Society for thirty-six blooms, eighteen Japanese sorts and eighteen incurved, was the chief point of interest in the show. For this there were five entries, every one of which was highly meritorious and where so much excellence was brought together there was naturally a difficult piece of work for the judges. Between the 1st and 2nd lots there was little to choose, but Mr. McHattie, of Newbattle Gardens, was awarded the 1st prize for a fine stand in which the principal flowers were:—Criterion, Duchess of Albany, E. Molyneux, M. H. Fabre, Duchess of Manchester, Jeanne d'Arc, Lord Alcester. The 2nd prize was awarded to Mr. Carruthers, gr. to Mrs. Fleming, Hillwood, Gosforth, who tabled a fine lot, the most prominent varieties being Gloriosum, Mdle. Lacroix, Amy Furze, Barbara, Queen of England, Jardin des Plantes, Pink Venus, Jeanne d'Arc, Mr. Hepburn, gr. to T. Burnley, Esq., Erich Bank, Kirm, Argyleshire, was placed 3rd with a stand of great merit.

In the class for twenty-four blooms, twelve Japanese and twelve incurved, Mr. Hepburn was placed 1st, with Prince Alfred, Jeanne d'Arc, Golden Beverly, John Salter, Elaine, and Boule d'Or as conspicuous blooms, and the whole fine. This competitor was the only one competing with dressed blooms; and on this point there was conflicting opinions, some holding that the practice led to artistic results, others that the undressed flowers were the most effective because natural. The 2nd prize in this class went to Mr. Carruthers, whose stand contained grand samples of Pink Venus, White Venus, Prince Alfred, Lord Alcester, Duke of Albany, Mdle. Lacroix, and Queen of England; and Mr. John Foster, gr. to Mrs. Roberts, Welwood Park, Selkirk, was 3rd with also a very excellent lot.

The class of twelve blooms incurved, distinct, brought Mr. A. McMillan, Trinity, Edinburgh, to the front, Mr. Donward, Townhead, Thornhill, Dumfries, being a good 2nd.

For six blooms incurved, distinct, Mr. Peter Matheson, gr. to Mr. Outram Dahling Mohr, Kirm, Argyle, stood 1st with a very fine stand of well-finished blooms; 2nd, Mr. Cumming, St. Roque, Grange Loan, Edinburgh; Mr. Rushton, 3rd.

In six blooms incurved, one variety, Mr. Carruthers took the 1st prize, Mr. Foster making a close 2nd; Mr. Kirie, gr., Sunderland Hall, Selkirk, being 3rd, competition being keen.

Twelve Japanese, distinct, placed Mr. Rushton 1st, with splendid examples of Elaine, Mrs. John Laing, Belle Paule, Boule d'Or, Soleil, Levant; and Mr. Matheson pressed him hard with fine blooms of Madame Rendatier, Belle Paule, Mdle. Lacroix. Mr. Jardine made a close 3rd in this class.

Among plants (Chrysanthemums) there was less keen competition. Mr. Jardine, of Kareteton Hall, Edinburgh; Mr. Cumming, Mr. Foote, Parson's Green, Edinburgh; Mr. Carruthers, Mr. Ferguson, Whitehouse Loan, Edinburgh; Mr. Donaldson, Ormelie, Murrayfield, Edinburgh, being the principal competitors.

#### FRUIT.

In this portion of the show the display was not large, but the quality was excellent. Mr. Murray, Culzeau Castle, Maybole, was placed 1st in the class of two bunches of black Grapes, with magnificent well coloured and highly bloomed Black Alicante; Mr. McHattie, Newbattle, being 2nd, with good Gros Colmar. In white Grapes Mr. McHattie was a very easy 1st, with two bunches, splendidly coloured, of Muscat of Alexandria, the fine amber tint of which was much admired and commented upon. The 2nd prize in this class went to Mr. Adam Duff, Clifton Hall Gardens, Ratho, for two beautiful bunches of Rivers' New Sweetwater, a handsome-looking Grape, new to this quarter.

The best collections of Apples and Pears came from Mr. Day, Galloway House, and were very fine fruit; and the 2nd best from Mr. McHattie.

Miscellaneous plants were represented by *Primula sinensis*, the best coming from Mr. Ball, gr., Glenbourne, Oswald Road, Edinburgh, who also tabled the best six *Primula obconica* in 5-inch pots, which were models in their way; and zonal *Pelargoniums*, the best six of which came from Mr. Rushton.

Cultural Certificates were awarded to Mr. D. Murray, Culzeau, for two bunches of *Barbarossa* Grapes, weighing each 11 lb., and for six splendid Pines, the sorts being Charlotte Rothschild, Prince Albert, Smooth Cayenne, and Queen.

Messrs. Methven & Sons, and Messrs. Laird & Sons decorated the orchestra, with admirable effect, with choice Palms and other foliage plants. Messrs. Dicksons & Co., occupied a table with a choice assortment of stove and greenhouse plants, and exhibited fine samples of Red Hawthorned Apples.

Messrs. Ireland & Thomson had a very attractive table of select stove and greenhouse plants, including some excellent *Nepenthes*. Messrs. James Dickson & Sons had a miscellaneous table of plants and dried flowers; Mr. Henry Erskine, a beautiful display of wreaths and other objects of the florists' art. Messrs. Methven & Sons made a beautiful display of cut blooms of *Chrysanthemums*, interspersed with small Ferns and Palms, &c., which was much admired; and Messrs. Laird & Sons exhibited over 100 blooms *Chrysanthemums*, which were equal to anything in point of quality that was to be found in the competing lists.

Mr. Fairgrieve, Dunkeld, exhibited a model of a new fruit tree protector; the leading feature of which is a movable screen of canvas suspended from the top of the wall, attached there to a 3-inch batten, and having a roller 4 inches in diameter at bottom. The screen is recommended to be fitted up in 20 feet lengths, and to have the rope and pulley fixed at the centre 10 feet from either ends. The pulley is fixed to the batten at the top, and a groove is made in the roller at the exact centre which in hauling up or letting down the screen serves to prevent unequal movement at either end and consequent entanglement.

#### BANBURY CHRYSANTHEMUM.

NOVEMBER 21.—This exhibition took place, as usual, in the Exchange Hall, and a pretty and bright display resulted. Prizes were also offered for winter-flowering plants, and fruit and Onions—always a strong point at Banbury. Plants of *Chrysanthemums* were somewhat poor, and showed signs of having been kept too long, and the judges wisely held back the 1st prizes in consequence.

*Groups of Chrysanthemums*.—One of the best seen this season came from Mr. Baskett, gr. to W. Mewburn, Esq., Wykeham Park, Banbury, the plants being well grown and finely bloomed, and included fine decorative Japanese and incurved varieties. Mr. T. Cummings, gr. to J. Gillett, Esq., was 2nd, with some finely bloomed plants.

*Tables of Winter-flowering Plants*.—These proved a very pleasing feature, and the arrangement and effect were decidedly in advance of last year. Mr. Doherty was a good 1st, with foliage and flowering plants, including *Calanthe Veitchii* and other Orchids, nicely blended; Mr. P. J. Perry, nurseryman, Banbury, being 2nd.

*Cut Flowers* were remarkably good, the lateness of the season considered. The best twenty-four incurved, distinct varieties, came from Mr. W. Allen, The Gardens, Swallowfield Park, Reading—nice fresh blooms, not over large, but of good quality—Empress of India, Princess Teck, Lord Wolsley, Hero of Stoke Newington, Lord Alcester, Emily Dale, Golden Empress, Golden John Salter, Queen of England, Princess of Wales, Cherub, Mrs. Norman Davis, and Lord Eversley being the leading ones; Mr. G. Neal, gr. to P. Southby, Bampton, was 2nd. B. N. Byass, Esq., Banbury, had the best twelve blooms of incurved, the Rev. E. E. Elliott being 2nd. Mr. F. J. Myers, Banbury, had the best nine.

*Japanese*.—Stands of twenty-four varieties were a good feature, Mr. Tipler, gr. to S. Gulliver, Esq., Aylesbury, being 1st, with some finely developed blooms of Madame J. Laing, Mons. Tarin, Ralph Brocklebank, Madame C. Audiguer, Val d'Andorre, Elaine, Gloriosum, Jeanne Delaux, Sarnia, Duchess of Albany, Thunberg, Mdle. Lacroix, &c.; 2nd, Mr. Allen.

Mr. Symington, Banbury, had the best twelve; R. N. Byass, Esq., being 2nd.

The Rev. F. W. Cartwright was 1st with nine blooms.

*Reflexed*.—Mr. Baskett had the best stand of twelve blooms—Cloth of Gold, Amy Furze, Cullingfordi, King of Crimson, Phidias, Madame M. Tezin, being very fine; Mr. Neal was 2nd.

*Anemone-flowered*.—These included the Japanese forms also, and Mr. Neal was 1st, having fine examples of Empress, Lady Margaret, Grand Alveole, Gluck, Miss Annie Lowe, Fleur de Marie, Georges Sand, Duchess of Edinburgh, &c.; 2nd, Mr. Allen.

Mr. Allen had the best twelve blooms of any one variety; being 1st also with fine Golden Christine, Mr. R. N. Byass being 2nd with the white incurved Isabella Bott.

*Fruit*.—There were several stands of three bunches of Grapes, Mr. J. Hughes, gr. to Col. Cartwright, Byfield, being 1st with well-finished Alicante, Mr. F. J. Myers being 2nd with the same variety.

Some very fine bunches of Gros Colmar, shown by Mr. E. Crump, Leamington were highly commended, and being eligible to compete in the Grape class.

The best eight dishes of Apples and Pears came from Mr. R. N. Byass—a very good lot of dessert and culinary varieties, Captain Bunyon being 2nd. Mr. J. Green also had the best six dishes of Pears, Miss Percy being 2nd.

*Potatoes*.—These were numerous, and very good. The best nine dishes came from Mr. A. Cartwright, who had very fine examples; 2nd, Mr. V. S. Cross, also with a fine lot. Mr. A. Batchelor had the best six dishes. The best round Potato was Satisfaction, Reading Giant the best kidney.

Several classes were set apart for amateurs plants, flowers, and fruits, the leading prize-takers being Miss Gillett, Mr. C. F. Edmunds, Mr. C. Gillett, Mr. W. Rowles, Mr. R. C. Rainbow, and Mr. W. Dale.

*Onions*.—These were very fine. Mr. Doherty was 1st with twelve marvellous examples of Lord Keeper, the heaviest bulbs weighing 2 lb.; Mr. Neal was 2nd with Anglo-Spanish.

#### YEOVIL.

NOVEMBER 21.—This exhibition was held in the Town Hall, and, taking it altogether, was a very good one.

*Groups*.—Mr. Crossman, gr. to J. Bruton, Esq., Yeovil, won the Silver Cup for the best arranged group of *Chrysanthemums*, his plants being in fine condition, the flowers large, plentiful, and fresh. Mr. W. Appleby, gr. to T. W. Dampier-Bide, Esq., Yeovil, taking a very close 2nd. Mr. S. Kidley, gr. to H. A. Helyar, Esq., Coker Court, Yeovil, and Mr. G. Taylor, gr. to Captain Marsh, Yeovil, were 1st and 2nd in that order with excellent arrangements.

*Cut Flowers—Open Classes*.—The competition in these classes was not quite so keen as it would have been if the Bristol show had not been on the same day. Mr. C. Lucas, gr. to John Marshall, Esq., Taunton, was 1st for twenty-four blooms, distinct, twelve Japanese and twelve incurved, with large, fresh, and well-formed blooms of Baronne de Prailly, Boule d'Or, Japonais, Ralph Brocklebank, Lord Alcester, Jeanne d'Arc, Lord Wolsley, Jardin des Plantes.

Mr. Lucas was also 1st for twelve reflexed varieties—an excellent stand.

Mr. W. Cocks, gr. to W. Fitzherbert Wyndham, Esq., Kingswear, South Devon, was 1st for six incurved and six Japanese, showing large well-finished blooms in both stands.

Mr. H. Copp, gr. to W. Drax, Esq., Holnest Park, Sherborne, had the best twelve bunches of pompons. Mr. Cocks staged an excellent stand of Japanese (not for competition), in which Mone J. Laing, Belle Paule, and Mrs. Cannell were conspicuous.

*Fruit* was a fairly good display, the quantity being good. Mr. Lloyd was 1st for a collection of six kinds of fruit, with good Black Alicante and Trebbiano Grapes, Glou Morceau Pear, Ribston Pippin Apples, and Vicomtesse Hericart de Thury Strawberry; Mr. Crossman was a good 2nd. Mr. Lloyd was 1st for two bunches of Black Alicante and two bunches of Mrs. Pince in the any other black class. Mr. Crossman was 1st for two bunches of Muscats; and Mr. Daley, gr. to R. Stamer Randle, Esq., Maperton House, Wincanton, occupied a like position with two bunches of Foster's Seedling in the any other white Grape class, all staging shapely well-finished bunches. Mr. Daley had the best three dishes of dessert Apples; and Mr. Lloyd had the best three dishes of culinary, as well as the best dish of dessert Pears. Mr. Kidley had the best dish of culinary Pears.

*Vegetables*.—There were four excellent collections

of eight kinds, and three collections of six kinds of salad, Mr. Bowers was 1st in both classes; Mr. Copp being 2nd in the former class, and Mr. Lloyd 2nd in the latter.

*Trade Collections.*—Messrs. Scott & Co. (Merriott and Yeovil), and Messrs. Robert Veitch & Son (Exeter), put up two admirable collections of Apples, not for competition.

### ST. ALBANS CHRYSANTHEMUM.

NOVEMBER 20 AND 21.—The second annual show was held in the Town Hall, and there were some fine examples on view. For three trained specimens of Japanese, Mr. Edwin Beckett, gr. to H. Hicks Gibbs, Esq., Aldenham House, Elstree, was 1st, with well flowered plants. He also had the best incurved.

In the competing group, on a space of 40 square feet, Mr. F. H. Froud, gr. to G. N. Martin, Esq., The Bank, St. Albans, was awarded 1st for a capital selection nicely arranged; the Ven. the Archdeacon Lawrence (gr. Mr. J. Fisher), St. Albans, coming 2nd.

Among non-competing exhibits were a group of foliage and stove plants from Mr. J. Watson, New Zealand Nursery, St. Albans; an assortment of Coleus, Lilies, Chrysanthemums, and foliage plants, shown by Mr. Freeman, gr. to Horace Slade, Esq., Hatfield Road, St. Albans; an effectively arranged group of Chrysanthemums and miscellaneous plants, by Mr. T. Nutting, gr. to J. Blundell Maple, Esq., M.P., Childwickbury; and a corresponding group from Mr. W. F. Emptage, gr. to J. S. Hill, Esq., Hawkshead.

For cut flowers Mr. E. Beckett led easily in both sections, with fine blooms. He also had a collection of Anemone-flowered Chrysanthemums.

There were some excellent vegetables, the most noticeable being those from Mr. Beckett. He also contributed fruit, in good examples of Black Alicante and Muscat of Alexandria Grapes, and Black Jamaica Pine-apple.

### LEEDS.

NOV. 20 AND 21.—In spite of previous drawbacks the Leeds Chrysanthemum Society determined to make one more try, and the result was a creditable display. The groups of plants were arranged round the sides of the hall, the principal prizes being taken by Mr. H. Featherstone, nurseryman, Kirkstall; and Mr. Eastwood, gr. to Mrs. Tetley, Leeds.

Grapes were the only fruit staged, the best Muscat of Alexandria and Alicante coming from Mr. Midegley, gr. to H. Mason, Esq., Bankfields, Bingley. Mr. Featherstone was the principal exhibitor in the classes for bouquets, &c.

There was a good show of cut blooms. In the principal class for thirty-six distinct varieties, eighteen to be Japanese and eighteen incurved, Mr. T. B. Morton, nurseryman, Darlington, took premier honours with a good lot, the Japanese being especially heavy and well arranged—Etoile de Lyon, a new pink variety, being large and effective, and also Mille. Louise Leroy, a new white variety. Incurved varieties were represented by the usual leading sorts; Mr. Midegley was 2nd.

For twenty-four blooms, twelve Japanese and twelve incurved, Mr. T. Barclay, gr. to R. Clough, Esq., Keighley, was 1st, staging capital examples of leading varieties.

Mr. Morton succeeded in winning 1st honours for twelve Japanese and twelve incurved in separate classes, with blooms similar in name and quality to the larger classes; Messrs. Midegley and Barclay followed closely.

Anemone-flowered and reflexed varieties were best staged by Mr. Morton, the former's being full-centred specimens, while the latter's were bright and good.

Mr. Grix, gr. to Sir James Kitson, Gledhow Hall, Leeds, was successful in securing 1st honours in the special class promoted by the members of the Leeds Faxon Society for eighteen blooms, distinct varieties, any section, staging a mixed lot of incurved and Japanese.

Messrs. Clibran & Sons, Altrincham, Cheshire, contributed five dozen blooms, Japanese and incurved, of leading varieties, along with a mixed collection of decorative stove and greenhouse plants not for competition, which created some interest, as did the collection of manures and other horticultural sundries, from Messrs. W. Wood & Sons, Wood Green, London.

### BRISTOL CHRYSANTHEMUM.

NOVEMBER 21 AND 22.—The twenty-fifth exhibition of this Society took place in the Drill Hall, Clifton, and may be regarded as being one of the best shows held this season. Specimen plants of Chrysanthemums were especially good. Fruits and vegetables were excellent.

*Plants.*—These exhibits were an imposing display by themselves, so numerous were they, and of such good quality. There were five competitors for the Silver Cup, to be awarded for eighty-four large-flowered distinct varieties, the prize going to Mr. J. Lee, gr. to T. M. Miller, Esq., Bristol; his plants were from 4 to 5 feet in diameter, well flowered, and neatly trained, Mrs. G. Rundle, Prince Alfred, and Mrs. Forsyth being of especial excellence.

Mr. J. Ayres, gr. to T. W. Gibson, Esq., Clifton, was 1st for six Japanese; and Mr. A. Ambrose, gr. to G. A. Tilney, Esq., Sneyd Park, was 1st with leading varieties, such as Mille. Melanie Fabre and Fair Mail of Guernsey, &c., freely flowered.

Trained standard plants were staged in capital condition, and consisted of Lord Wolsley, Empress of India, Bronze Jardin des Plantes, and others, carrying from twenty to thirty large blooms, quite equal in quality to the cut blooms shown as such. Mr. Cole, gr. to W. F. Threadwell, Esq., Bath, took the 1st, and Mr. H. Hawking, gr. to Joseph Leach, Esq., the 2nd prizes.

A group of Chrysanthemums occupying a space 12 feet by 7 feet brought six competitors. The best plants, having both fine flowers and good foliage, were staged by Mr. A. Parkes, gr. to Captain Alcock, Bristol; the 2nd prize falling to Mr. A. Ambrose.

Cut blooms were shown in large numbers, and the class for thirty-six distinct, twelve to be Japanese and the remainder incurved, was the largest. Mr. Thomas, gr. to W. Marshall, Esq., Taunton, was the best among six exhibitors, the blooms being large and solid; the best of the Japanese varieties were Boule d'Or, E. Molyneux, M. J. M. Pigny, Thunberg, and Duchess of Albany; and of incurved flowers, Empress of India, Jean d'Arc, Mrs. Heale, Jardin des Plantes, and Hero of Stoke Newington. Mr. A. Parkes showed well, and was a good 2nd.

For twelve incurved, 1st, Mr. C. Cooper, gr. to C. L. Collard, Esq., Taunton; the medium blooms he showed possessed freshness and finish. The leading variety shown was Princess of Wales, very fine. Mr. W. Carpenter, gr. to A. Cole, Esq., showed in good form, and took the 2nd prize.

The best six incurved blooms were those of Mr. A. Parkes—fine fresh blooms.

Anemone-flowered were shown in twelve varieties in capital condition by Mr. C. Lucas, gr. to J. Marshall, Esq., Taunton; Lady Margaret, Fleur de Marie, and Gluck were the best, all of them were full-centred, and fresh blooms. Mr. E. Miller, gr. to F. Sargent, Esq., Old Sneyd Park, Bristol, was 2nd.

Mr. Cooper had the best twelve Japanese varieties, and was 1st for eighteen Japanese, and for the same number of incurved varieties; the best among the former being Boule d'Or, Baronne de Prailly, Carew Underwood, Edwin Molyneux, Val d'Andorre, and Thunberg. Mr. Carpenter and Mr. Thomas were respectively 2nd in these classes, both showing well.

Mr. J. Asplin, gr. to W. M. Blake, Esq., Hasfield Court, Tewkesbury, was 1st for six blooms of varieties of recent introduction; Alice Bird, a bright yellow being one of the more conspicuous blooms shown.

*Fruit.*—A good show was made in this section. For a collection of six dishes, Pines excluded.—1st, Mr. W. Iggliden, gr. to the Earl of Cork, Marston House, Frome.

Black Hamburg Grapes were best shown by Mr. Bannister, gr. to H. St. Vincent Ames, Esq., Cote House, Westbury-on-Trym.

For two bunches Muscat of Alexandria, Mr. W. Coates was 1st with capital bunches, having large berries of good colour; Mr. J. Gibson, gr. to Earl Cowley, Draycott Park, who was 2nd, showed well.

In the Alicante class there were fifteen competitors, the 1st prize being taken by Mr. Iggliden with large bunches, compact, and of good colour; by Mr. F. Crocker, gr. to Mrs. M. H. Miles, Ham Green House, Bristol, was 2nd, he failing to gain 1st place by want of size in the berries.

Nine competitors showed Lady Downe's; the best were those of Mr. Crocker. Mr. J. Gibson being placed 2nd with smaller bunches.

Eight exhibitors showed Gros Colmar. Mr. Iggliden's, which were good in all points, were

placed 1st; and those of Mr. Gibson 2nd. Mrs. Pince was best staged by Mr. J. Wilkinson, Bristol; and in the class for any other variety of black Grapes, the bunches of Gros Maroc, shown by Mr. Crocker, were pronounced to be fine on all points, and received 1st honours, the Black Barbossa, shown by Mr. Iggliden, obtaining the 2nd place.

Mr. Wilkinson staged Trebbiano in good condition in the class for any other white Grapes, taking the 1st prize; and Mr. Iggliden followed with Golden Queen.

Pears made a good show, and the 1st prizes for six and for four varieties were secured by Mr. W. H. Bannister. Apples were also good.

Vegetables in ten distinct varieties brought eight competitors, the best, those from Mr. W. H. Bannister, were of especial excellence. We give the names of the most noteworthy kinds, viz., Veitch's Matchless Carrots, Perfection Brussels Sprouts, Danvers Yellow Onion, Hackwood Park Tomato, and Chancellor Potato; Mr. G. Fragnell, gr. to C. D. W. Digby, Esq., Sherborne Castle, Dorset, was a close 2nd.

The assays for miscellaneous productions were filled generally in a very creditable manner. The bank of plants—10 feet by 5 feet—put up by Mr. W. Coates, was very telling. Plants with ornamental foliage, shown by Mr. A. Hancock, gr. to W. Somers, Esq., Clifton, were excellent, and the specimen of *Cycas revoluta* especially so.

Mr. J. Harris, gr. to Dr. Trotman, secured the 1st place for the best stove or greenhouse plant with a well bloomed *Eucharis amazzonica*.

A specimen of *Cypripedium insigne* with thirty-six blooms obtained for Mr. J. Coles the 1st prize in the class for a single Orchid.

Poinsettias were well shown by Mr. Cole; and Mr. G. Price, gr. to S. Budget, Esq., Bristol, was 1st for table plants.

### ISLE OF THANET.

NOVEMBER 21 AND 22.—The second annual exhibition was held at the Hall-by-the-Sea, Margate; the competition in many cases was very keen, in this respect showing an improvement on last year's show.

For a group of miscellaneous plants, arranged for effect, the 1st honours were awarded to Mr. J. Gosden, gr. to Mr. J. Atkinson, Westbrook, Margate, who showed a charmingly arranged group of beautiful plants. Mr. F. Roberts, gr. to Mr. Sebag Montefiore, was 2nd.

There were six groups of Chrysanthemums in competition, which was very close, the first honours falling to Mr. J. Cornford, gr. to Mr. H. H. Powell Cotton, who showed a very neatly arranged group of excellent plants. Two very fine groups were shown by Mr. E. Bishop, gr. to Mrs. Gray, of Birchington Hall, and Mr. F. Roberts, who were awarded 2nd and 3rd prizes respectively.

Mr. Cornford showed four very fine specimens (incurved), for which he received 1st honours; but for six trained specimens (incurved), single Japanese, and three specimens (reflexed), Mr. D. Fairweather, gr. to Mr. W. J. Jarrett, Westgate, led.

Mr. W. Iles, gr. to Mr. A. R. Rayden, Birchington, showed some very nice plants, and secured 1st place for four Japanese and for three pompons.

There was a very fine show of cut blooms, the most successful competitor being Mr. D. Fairweather.

Mr. J. Cornford was also very successful, and his group of twenty-four incurved was excellent.

For thirty-six blooms the 1st prize was awarded to a capital collection by Mr. T. Skinner, East Sutton Park.

Mr. J. Gosden, was 1st for a very pretty collection of plants suitable for table decorations.

The display of fruit was exceptionally good. Mr. D. Fairweather had excellent Grapes, while Apples shown by Mr. F. Miller, gr. to Mr. J. T. Friend, Northdown, and the Pears by Mr. W. C. Barber and Mr. O. Wilkin were also good. There was also a very good show of vegetables.

*Amateurs.*—The show of plants in pots was very weak, being scarcely up to the average of those shown by cottagers, and in some classes the judges did not think the exhibits worthy of a 1st prize. There was, however, a very good show of cut blooms, Mr. Gaines carrying off many of the prizes; but in two classes he had to succumb to Mr. R. Pepper. Mr. J. Knight was also a successful exhibitor. Mr. Jarman, gr. to J. Farmer, Esq., Margate, had a grand group, not for competition, of Chrysanthemums which was singled out as the best group in the show.

Watt, Doyenné Boussoch. — *Jno. Jones*, Grape, Madresfield Court. — *A. G. N.*, Hollandbury; 2, Beauty of Kent; 3, Round Winter Nonsuch; 4, Grange's Pearmain; 5, like Crimson Queening; 6, Adam's Pearmain. — *W. C.*, 1, not recognised; 2, Triomphe de Jodoigne; 3, Striped Beaufin. — *A. N.*, Apple, Ringer; Pear, Beurré Clairgeau.

NAMES OF PLANTS: *A. M.*, Abies (or Picea) cephalonica. — *C. W. K.*, That is strange. No. 1 is an indifferent variety of *Onocidium Forbesii*; and 3 is a fine variety which comes near to *O. Forbesii* Borwickiana, illustrated in *Gardeners' Chronicle*, p. 525, vol. xi., 1879. — *H. G. E.*, We cannot name plants from such scraps: send better, and we will endeavour to comply with your wish. — *C. W. Strickland*, *Lachenalia pendula*. — *S. W.*, *Maxillaria picta*. — *Subscriber*, 1, *Lastrea glabella*; 2, *Adiantum concinnum latum*; 3, *Polypodium appendiculatum*; 4, *Pteris serrulata*; 5, *Lomaria spicata*; 6, *Polypodium vulgare*; 7, *Blechnum occidentale*. — *W. F. C.*, Piece of plant, *Pelargonium glutinosum*; Fern, *Pteris serrulata*. — *G. M.*, Paris, 1, not recognised; 2, *Onocidium sp.*; 3, *Phalanopsis rosea*; 4, not recognised; 5, *Odontoglossum constrictum*; 6, *Goodyera pubescens*. — *J. R.*, *Stanhopaea grandifolia* (Lindley). — *T. J. J.*, *Stanhopaea quercifolia*. — *J. Rigg*, Specimen quite insufficient.

NAMING PLANTS: *G. M.*, We are always desirous to oblige our correspondents by naming specimens for them, but we must request them to furnish us with good specimens properly packed and in number not exceeding six at a time. As you say, some of the specimens sent were, indeed, in a bad state, and on arrival others were decayed beyond recognition. We never like to make guesses at a plant's name as it is unsatisfactory to all concerned and sometimes results in grave errors.

ODONTOGLOSSUM PULCHELLUM: *L. C.* We can find no record of your communications having been received by us either at the beginning of the year or in October. We "boycott" no one, but are always pleased to afford our correspondents the desired information with the least possible delay. Can you not send another flower?

OXFORD MARKET: *Robin*, We know of no market so called.

PEAR BEURRÉ SUPERIEUR: *W. Ingram*, The fruits, if small, were of delicious flavour. It should certainly not fail in any garden.

PALE SEEDS: *J. L. R.*, These are sometimes to be picked up at the horticultural sale-rooms. English nurserymen do not generally deal in them. Try Hurst & Co., wholesale seedsmen, Houndsditch, E.C.; or Mr. Strauss, Eberfeld, Cologne, Rhenish Prussia.

PEARS: *C. W. W.*, The omission of name of place is, no doubt, to most persons a serious one. Our correspondent, "E. M.," was doubtless writing for gardeners who know what varieties of Pears will grow well in certain parts of England without usually requiring to be placed on a wall. As a general rule, it may be stated that few varieties, and these none of them very good ones, will grow without a wall on which to train them in parts north of the Humber. Even in the warmer parts of England and Ireland there are few Pears which are not the better for being so grown, although in sheltered walled-in gardens excellent fruits are obtained from espaliers, cordons, pyramids, &c.

RALEIGH AND THE POTATO: *H. Fincham*, An account of the Potato Conference and Exhibition is to be found in our issue for December 4, 1886. The Royal Horticultural Society was not engaged in that undertaking.

TERMS OF TENANCY: *One perplexed*, Your case is such a grave one, that you would only do yourself justice by taking proper legal advice. We cannot venture to advise, especially as you have had no agreement in respect of the holding.

TRAVELLING EXPENSES: *H. F.*, You cannot claim them, but it is customary to reimburse the young gardener when he has been put to any expense in reaching his situation.

WALNUTS: *W. Collett*, The nuts were unripe at the end of the season, that is all.

COMMUNICATIONS RECEIVED. — *J. E. P.* (next week). — *D. Crombie*. — *J. E. F.*, *S. & Co.* — *E. J.* — *R. V. & S.* — *R. D.* — *W. Ingram* (next week). — *W. W.* — *W. G.* — *J. V.* — *R. H. **STANDEN'S**  
Established  
Over 20 Years. **MANURE**  
*Exceeds all others in general fertilising properties and staying powers.*  
It promotes a rapid, healthy, and robust growth to plants generally.  
It is a clean and dry powder, with very little smell.  
It is consequently particularly adaptable for ladies interested in plant culture.  
The highly fertilising properties of this Manure render its money value, in comparison with other manures, at least double; and users will find that very small quantities will produce favourable and lasting results.  
Sold in Tins, 1/-, 2/6, 5/6, and 10/6 each; and in Kegs (free) at Reduced Prices, 28 lbs., 12/6; 56 lbs., 23/-; 112 lbs., 42/- each.

SOLE MANUFACTURERS:  
**CORRY, SOPER, FOWLER & CO.**  
(LIMITED),  
16, Finsbury Street, London, E.C.  
SOLD BY ALL SEEDSMEN AND NURSERYMEN.

**GARDEN REQUISITES.**

**BEESON'S MANURE.**—The Best and Cheapest Fertiliser for all purposes. Write for Circular containing the Leading Gardeners' and Market Growers' Reports. Sold in Tins, 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each, or 1 cwt. Bags, sealed, 13s. By all Seedsmen, or apply direct to W. H. BEESON, Carbrook Bowe Mills, Sheffield.

Made in superior earthenware, 14 in. long, 6½ in. deep, and 6 in. wide. Inside, 2½ inches from the top, is a perforated movable false bottom, upon which the soil for cuttings or seeds is placed, the lower half being filled with water, which is replenished when required through the funnel. It fits evenly on 4-inch hot-water pipes, and will be found a simple and effectual means of utilising them for propagating purposes. With the false bottom removed it forms an effective vaporiser. Price 3s. each, or three for 8s. 6d., six carriage and package free to any station in Great Britain for 41 1s. Sole makers and patentees, T. PASCALL AND SONS, South Norwood Pottery, Surrey, S.E.

Ours are unsurpassed by any in the Trade. Garden Pots. £5 orders carriage paid to any goods station within 100 miles of London. Samples carriage free. Orchard Pottery of every description. Send for Price List.—T. PASCALL & SONS, South Norwood Pottery, Surrey, S.E.

To Nurserymen, Seed Merchants, and Florists. J. Angel Mats lower than any other house in the trade; also Petersburg Mats and Mat Bags, Raffia Fibre, Tobacco Paper, and Shading. Prices free.—4 and 5, Wormwood Street, E.C.

**GARDEN REQUISITES.**—Sticks, Labels, Virgin Cork, Raffia, Mats, Bamboo Canes, Rustic Work Manures, &c. Cheapest Prices of WATSON AND SCULL, 90, Lower Thames Street, London, E.C.

**MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus.**

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price 2s. post-free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country, an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made and gentlemen waited on in any part of the country. Plans and Estimates free on application.

## DR. SMILES'S WORKS.

**LIVES OF THE ENGINEERS.** Illustrated.  
5 vols. 7s. 6d. each.

"We cannot but refer to the captivating and instructive  
volumes, which Mr. Smiles has devoted to the 'Lives of  
the Engineers,' a record not before attempted of the  
achievements of a race of men who have conferred the  
highest honour and the most extensive benefits on their  
country."—*Edinburgh Review*.

**LIFE OF GEORGE STEPHENSON.** With  
Illustrations. 21s., 7s. 6d., or 2s. 6d.

We hardly ever remember to have read a biography so  
thoroughly unaffected. . . . It is an artless attempt  
to set out the character and career of one of the most in-  
genious, honest, resolute, homely, and kind-hearted of  
human beings. The entire style of the work is unambitious,  
lucid, thoroughly manly, and good."—*Saturday*  
*Review*.

**JAMES NASMYTH, ENGINEER: AN AUTO-  
BIOGRAPHY.** Illustrated. 6s.

"The whole range of history biography may be searched  
in vain for a more interesting record of an active, useful,  
successful, and happy life, than is presented by the deli-  
cious autobiography of James Nasmyth."—*Edinburgh Review*.  
A few copies of the Large Paper Edition, with Portrait  
etched by E. J. B. & Co., 18s., may still be obtained.

and Countries in the Universal Postal Union, 10s.

E. H. LIBBY, Publisher, 751, Broadway,  
New York, U.S.A.

**WANTED**, by a Gentleman in Sussex, a  
HEAD WORKING GARDENER, married, and without  
young children. Must have a thorough knowledge of his  
profession in all its branches, acquired in first-class Private  
Gardens. State age, and copies of testimonials, and apply in  
own handwriting, to BEACONHILL, Mr. Reading, 127,  
Fulham Road, S.W.

**Gardener, Laundress.**  
**WANTED**, for Surrey, a married couple,  
without children — man as SECOND GARDENER,  
accustomed to glass; Wife to take charge of Laundry and  
Dairy with assistance, to be by letter. COHEN, 3,  
Devonshire Place, Portland Place, London, W.

**WANTED**, a FOREMAN. Must be well-up  
in Fruit and Plant Growing in general, especially  
Chrysanthemums. Wages, 10s. per week, and holiday pay,  
with full particulars, to J. CORNFORD, Quex Park, Bir-  
chington, Kent.

**WANTED**, a good PLANT GROWER and  
SALESMAN for the Indoor Department; a married  
man preferred.—Applicants to state age and wages expected  
to FISHES, SON, and SIBRAY, Handsworth Nurseries,  
Sheffield.

**WANTED, AT ONCE**, a trustworthy MAN,  
able to Grow Flowers for Market, and look after  
Small Nursery.—ALFRED BALL, Florist, Parkstone, Dorset.

**WANTED**, a young MAN, to Grow and  
Propagate Chrysanthemums and Clematis in quantity.  
Must be quick at Potting and Tying. One who has been in  
a Market Nursery preferred.—State age and wages expected.  
—S. S., *Gardener's Chronicle* Office, 41, Wellington Street,  
Strand, W.C.

**TO GARDENERS.**—The Managers of the  
Kensington and Chelsea School District REQUIRE  
for their Cottage Home School, at Banstead, Surrey, a respectable  
married couple, to take charge of and act as FATHER and  
MOTHER of a House containing about thirty-eight Boys. The  
man also undertaking the Cultivation of the Kitchen Garden  
and Grounds attached to the School, and imparting a know-  
ledge of Gardening to the Boys placed under him. Joint salary  
to commence at £20 per annum, rising to £24 annually to £24  
per annum, with furnished apartments, board, washing  
uniform, medical attendance, and an allowance of £2 per annum  
in lieu of beer. Candidates, who must be between 28 and 45  
years of age, must be able to read and write, and must furnish  
satisfactory personal references as to sobriety and respectability,  
as well as to the man's capability as a Gardener. Preference  
will be given to Candidates without children, or whose children  
do not wish to reside with them.

Forms of application may be obtained by forwarding a  
stamped, addressed, foolscap envelope to the undersigned, to  
whom applications, accompanied by copies of three testimonials  
of recent date, must be delivered, by or before 10 A.M., on  
Monday, December 10, next. By order.

JNO. H. RUTHERGLEN, Clerk to the Managers,  
Guardians' Office, Marlborough Road, Kensington, W.,  
November 24, 1888.

**WANTED**, MAN, to take charge of Pleasure  
Ground. Must have a knowledge of Herbaceous  
Plants.—Send references and salary required to A. BRAY,  
Floral Hall, Richmond.

**WANTED**, for a Market Nursery, a young  
MAN, well up in Potting and Watering. Situation  
permanent to a suitable person. Wages commencing at 18s.—  
State age and what experience, to TURNER BROS., Allerton,  
Liverpool.

**WANTED**, for the Counter, a HEAD SHOP-  
MAN, to take entire charge of Retail Work in Bulbs,  
Vegetable and Flower Seeds. The latter work to be personal.  
No one need apply unless able to produce first-class references,  
and have at least 12 years' experience.—WM. BAYLOR HART-  
LAND, Seedsmn, 24, Patank Street, Cork.

**WANTED**, a SHOPMAN, used to General  
Florist and Seed Trade.—Send reference and salary  
expected, to A. BRAY, Floral Hall, Richmond.

**WANTED**, a JUNIOR ASSISTANT, in  
Retail Vegetable Seed Department. Age from 17 to  
20.—Apply in own handwriting, with full particulars and  
references, to B. S. WILLIAMS, Victoria and Paradise Nur-  
series, Upper Holloway, London, N.

**WANTED,** a young Man, accustomed to packing Bulbs, Plants, &c.—**WILLIAM DENMAN**, 7, Catharine Street, London, W.C.

### GARDENING APPOINTMENTS.

**MR. J. LINDSAY**, late Head Gardener, Exton Park, succeeds his father, the late **MR. ALEXANDER LINDSAY**, as Head Gardener to the Duchess of Buccleuch, Ditton Park, Slough.

**MR. J. McDONALD**, late of Leyton Hall, Salop, has been appointed Head Gardener, to the Earl of Gainsborough, Exton Park, Oakham, Rutland.

### WANT PLACES.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

**NOTICE TO ADVERTISERS.**—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when consenting to give their Names and Addresses, and a Reference to the Advertisement which they wish repeated.

**POSTAL ORDERS.**—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable to **NO. 42, DRURY LANE, W. RICHARDS**, as, unless the number of *the Postal Order* is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

**N.B.**—The best and safest means of Remitting is by **POST-OFFICE MONEY ORDER**.

**B. S. WILLIAMS** begs to intimate that he has at present in the Nursery and upon his Register some excellent Men competent either to fill the situation of **HEAD GARDENER, BAILEIFF, FOREMAN, or JOURNEYMAN**. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—**Holloway, N.**

#### Head Gardeners.

**JOHN LAING AND SONS** can at present recommend with every confidence several energetic and practical **MEN** of tested ability and first-rate character. Ladies and Gentlemen in want of **GARDENERS and BAILEIFFS**, and **HEAD GARDENERS** for first-rate Establishments or Single-handed Situations, can be suited and have full particulars by applying at **Stansfeld Park and Rutland Park Nurseries**, Forest Hill, London, S.E.

**To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BAILEIFFS, or GARDENERS.**

**JAMES CARTER AND CO.** have at all times upon their Register reliable and competent **MEN**, several of whom are well known to Messrs. **Carter**. Enquiries should be made to 237 and 238, High Holborn, W.C.

Gardeners, Foresters, Land Stewards.

**R. D. LAIR AND SONS** can recommend with every confidence Scotchmen who can be styled as **GARDENERS, FORESTERS, or LAND STEWARDS**, either for large or small establishments, and will be pleased to furnish full particulars on application.—17, Frederick Street, Edinburgh.

**GARDENER (HEAD WORKING).**—Age 38, married, one daughter (age 12).—**MR. LEACH**, Albany Park, Guildford, can highly recommend a thorough good man to any Lady or Gentleman in want of a practical and reliable servant.

**GARDENER (GENERAL), and practical Hardy** Fruit Cultivator of large experience, desires an appointment as such, or in any similar capacity.—Middle-aged, married (small family). Well acquainted with the Management of Land Property in all departments. First-class references.—**POMOLOGIST**, Dickinsons, Royal Nurseries, Chester.

**GARDENER (SINGLE-HANDED), or where boy is kept.**—Age 33, married, (one child); understands Vines, Greenhouses, Flower and Kitchen Gardening.—**GARDENER**, Roden Hall, High Ercall, Wellington.

**GARDENER (SECOND), or KITCHEN and FLOWER GARDENER.**—Married; nine years' experience Inside and Out. Well recommended.—State wages and particulars to **J. MAJOR**, Holmbyr, St. Mary, Dorking.

**GARDENER (UNDER).**—Age 25; two years' good character.—**H. TRASK**, 59, Queen Street, Yeovil.

**GARDENER (UNDER).**—Age 22; well recommended from last situation. Two and a half years' good character. Experience Inside and Out.—**ATKIN**, 42, Chatham Road, Rock Ferry, Cheshire.

**FOREMAN, or FIRST JOURNEYMAN**, in the Houses. Practical experience for eight years in good places. Good temperance.—**T. COLLINS**, 10, Clarence Road, Birkdale, Southport.

**FOREMAN, PROPAGATOR or GROWER.**—At New year.—Feras, Palm, &c., in quantity. Stone Greenhouse, Soft-wooded Plants.—**H. G. C.**, 320, Green Lanes, S.W.

**FOREMAN PROPAGATOR and GROWER.**—Age 34; thoroughly experienced. Efficient in the Cut Flower Trade. Good reference.—**S. L.**, Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

**NURSERY FOREMAN.**—Age 24, married; thoroughly experienced. Highest references for character and ability.—**R. STOREY**, Masfen, Newcastle-on-Tyne.

**PROPAGATOR and GROWER of Soft-wooded Plants for Market.**—Age 29; fourteen years' experience.—**A. B.**, 13, Peerless Buildings, Peerless Street, City Road, E.C.

#### To Nurserymen.

**PROPAGATOR and GROWER, or SECOND.**—Age 27; well up in Tea Roses, Vines, Clematis, and General Soft-wooded Apply, giving particulars, to **H. CALLOWAY**, 3, St. Rode Road, London, S.W.

**MARKET GROWER and PROPAGATOR** of Roses, Fuchs, Chrys, and Lily of the Valley, and all Flowering Bulbs and Plants for Cut Bloom. Trade and Market. Good all round London practice.—**F. E. WILLIAMS**, Elton Nurseries, Bury, Lancashire.

**GROWERS for MARKET.**—ADVERTISER can recommend a reliable young man, accustomed to Growing Roses, Ferns, Tomatos, Cut Flowers, &c., extensively for Market.—**THE MANAGER**, The Vineries, Framfield, Sussex.

**JOURNEYMAN**, in the Houses.—Age 20; good character. Total abstainer.—**W. DAVIES**, The Gardens, Downton Castle, Ludlow.

**JOURNEYMAN**, in the Houses.—Age 19; five years' experience. Good character.—**W. ELLIOTT**, The Gardens, Guy's Cliffe, Warwick.

**JOURNEYMAN**, Inside or Out.—Age 21; four years in present situation; two under Glass. Thorough good practical and obliging.—**H. C.**, Moreton Gardens, Bideford, Devon.

**JOURNEYMAN**, in the Houses.—Age 20.—**G. HARKETT**, The Gardens, Huntley's, Tunbridge Wells, can highly recommend a young man as above; understands Fruit and Plant Growing. Good working and industrious; and who will be pleased to answer any inquiries concerning him.

**TO FRUIT GROWERS.**—The Advertiser, thoroughly experienced in Market Work, could undertake entire Management of a large estate in the way of fruit growing, combined with Growing under Glass, Grapes Cut Flowers, Tomatos, and all requirements of a First-class Trade (demand).—**EXAK**, 11, Wellington Street, Strand, W.C.

**TO NURSERYMEN.**—The Advertiser, a young man accustomed to work, seeks re-engagement in the Hardy Propagation and Planting of a good firm is second. Has had five years' thorough practical experience in present situation, where all kinds of Hardy Plants are propagated in great quantity by the best known methods. Age 21. **HOLLOWAY'S PILLS.**—The chief wonder of modern times.—This incomparable medicine increases the appetite, strengthens the stomach, cleanses the liver, corrects biliousness, prevents flatulency, purifies the system, invigorates the nerves, and reinstates sound health. The enormous demand for these Pills throughout the globe astonishes everybody, and a single trial convinces the most sceptical that no medicine equals Holloway's Pills in its ability to remove all complaints incidental to the human race. They are a blessing to the afflicted, and a boon to all that labour under internal or external diseases. The purification of the blood, removal of all restraint from the secretive organs, and gentle purgative action are the prolific sources of the extensive curative range of Holloway's Pills.

# "PRESIDENT CARNOT."

## NEW AND SELECT STOCK OF BRUSSELS SPROUTS.

**JOHN ETHERINGTON DIXON**, having purchased the entire Stock of this extraordinary variety, purposes sending it out for season 1889. It has proved, by all who have grown it to be the best extant for size of knobs and habit of growth. It grows similar to a pyramid, and has been selected with the greatest care possible, so that it may be depended upon as something specially good.

### TESTIMONIALS.

From Mr. ALBERT WIFE, Gardener to NATHANIEL CLAYTON, Esq., J.P., Eastcliff Gardens, Lincoln.

"SIR,—Your strain of Brussels Sprouts is the best in cultivation. I tried it the first year alongside three of the leading strains, but it proved so much superior to the others that I have grown no other since."

"The exhibit of your strain of Brussels Sprouts at our Chrysanthemum Show will not easily be forgotten by those who were present, drawing high encomiums from the Judge, Mr. J. WRIGHT, *Journal of Horticulture*. January 5, 1888."

The Fern Nurseries, Leamington, Oct. 16, 1888.

"DEAR SIR,—Your Brussels Sprouts, 'President Carnot,' are, without a doubt, the best we have ever grown for crop and quality.—Yours truly, RAPER AND IRWIN."

Bentley Road, Doncaster, Oct. 21, 1888.

"DEAR SIR,—Your 'President Carnot' Brussels Sprouts are the best I have ever grown.—Yours truly, JNO. TURNER."

11, Midland Road, Wellingborough, Oct. 25, 1888.

"SIR,—I consider 'President Carnot' Brussels Sprouts are just what we require, being compact in growth, fine sprouts, and excellent quality.—Yours respectfully, GEORGE DOUGLAS."

Wantage, Oct. 25, 1888.

"DEAR SIR,—Your Brussels Sprout, 'President Carnot' is undoubtedly a variety of great excellence.—Yours truly, W. CAUDWELL."

1, Sepulchre Street, Sudbury, Suffolk, Oct. 24, 1888.

"DEAR SIR,—I believe the Brussels Sprouts 'President Carnot' to be a very good one. I have grown it by the side of several others and find it much the best.—I am, dear Sir, yours truly, C. CANDY."

Swanley, Kent, Oct. 25, 1888.

"DEAR SIR,—It is rather early to speak of Brussels Sprouts, however, we can see sufficiently that your 'President Carnot' is a very fine selection; every plant is well studded with close, round, hard heads of Greens; we are of opinion it will prove the best in our trial ground, where we have all the best varieties of vegetables in cultivation.—Yours truly, H. CANNELL AND SONS."

Ordnal Lodge, Retford, Oct. 15, 1888.

"DEAR SIR,—Your Brussels Sprouts, 'President Carnot,' are the largest and best I have ever grown. You deserve much praise from all lovers of this most useful vegetable, for introducing such an excellent variety.—Yours truly, THOS. BESCOBY."

North Walsham, Oct. 16, 1888.

"DEAR SIR,—The 'President Carnot' Brussels Sprouts are, in my opinion, as good as can be, being large and firm buttons. I may add, I shall grow a larger quantity another year.—I am, Sir, yours truly, A. D. HEALEY."

Aberdeen, Oct. 26, 1888.

"DEAR SIR,—Owing to an exceptionally dry season at the time of planting out many of our plants were lost, but those which remain are excellent sprouters. We like the 'President Carnot,' Brussel Sprouts, and can confidently recommend them to our customers.—We are, yours faithfully, J. MAYOR AND SONS."

Brigg Nov. 12, 1888.

"DEAR SIR,—I find my gardener is very well satisfied with the 'President Carnot' Brussel Sprouts they are the best we have this year.—Yours truly, D. J. BRIGGS."

### OPINIONS OF THE PRESS.

A BROEDINGNAGIAN BRUSSELS SPROUT.—To local vegetarians a paradise is shortly in store in the shape of a succulent Sprout of mammoth proportions, the only seed in existence of which has been secured by Mr. JOHN ETHERINGTON DIXON, Seedman, Lord Street. This new variety is known as the PRESIDENT CARNOT BRUSSELS SPROUT, and the plants are of huge size and symmetrical proportions. The Sprouts being of excellent flavour, market gardeners will put in a strong demand for the limited quantity of this seed in the market.—From the "Retford and Gainsford Times," December 30, 1887.

Mr. J. ETHERINGTON DIXON has some extraordinary "BRUSSELS SPROUTS" of a new variety, as may be judged by the name "PRESIDENT CARNOT," the seed of which will be sent out during the coming spring in sealed packets. The product of the first year's growth are of a truly wonderful size, firm in the heart, the plant being of a pyramidal shape, and very thickly studded with large sprouts.—From the "Retford, Worksop, and Gainsborough News," December 24, 1887.

Price 2s. 6d. per Packet, Free by Post.

# SALES BY AUCTION.

Barnet, N.

In the High Court of Justice, Chancery Division,  
Corwall v. Corwell.

SIX DAYS' CLEARANCE SALE of the whole of the extensive  
and well-grown NURSERY STOCK and GREENHOUSE  
PLANTS.

MESSRS. PROTHEROE AND MORRIS (the  
persons appointed by Mr. Justice Stirling, the Judge  
to whose Court the cause is attached) will SELL by AUCTION,  
on the Premises, the Hadley Nursery, High Street, Barnet, and  
the Common Nursery, Barnet Common, within a short distance  
of the High Barnet Railway Station, on MONDAY, December 10,  
and five following days, at 12 o'clock punctually each day, the  
whole of the unusually well-grown NURSERY STOCK and  
GREENHOUSE PLANTS, including the following:—

20,000 Conifers, of sorts	10,000 Standard Roses
500 Specimen Conifers	10,000 Dwarf Roses
3,500 Aucubas	1,000 Standard Roses, Gloire
2,000 Laurels	1,000 Standard Roses, Gloire
2,000 Green and Variegated	10,000 Privet

in Trade, &c.

May be viewed one week prior to the Sale. Catalogues may  
be obtained at the Home Nursery, High Street, Barnet; of  
Messrs. HOUGHTON and BYFIELD, Solicitors, 85, Grace-  
church Street, E.C.; and of Messrs. MORTIMER,  
BARNES and BAKER, Solicitors, 10, Gray's Inn Square, W.C.;  
and of the Auctioneers and Valuers, 67 and 68,  
Chancery Lane, E.C., and Leytonstone, E.

Monday Next.—The Hadley Nurseries, Barnet, N.

VALUABLE LEASEHOLD INTEREST.

MESSRS. PROTHEROE AND MORRIS will  
SELL by AUCTION, on the Premises, the Hadley  
Nurseries, High Street, Barnet, N., on MONDAY NEXT,  
December 10, at 12 o'clock precisely, immediately preceding  
the Sale of the Stock, the VALUABLE LEASEHOLD PROPERTY,  
comprising 55 acres of Land, eight Greenhouses, Dwelling-  
house, and Seed Shop, held at a very moderate Ground Rent.

The Sale presents an unusual opportunity to any one desirous  
of securing a First-class Nursery, as the whole of the Stock  
will be disposed of by Auction, thus enabling the Purchaser  
to secure only such items as may be necessary for continuing  
the business.

Dutch Bulbs.—Monday and Thursday Next.

GREAT UNRESERVED SALES.

MESSRS. PROTHEROE AND MORRIS will  
SELL by AUCTION, at their Central Sale Rooms, 67  
and 68, Chancery Lane, E.C., on MONDAY and THURSDAY  
NEXT, December 10 and 13, at half-past 11 o'clock precisely,  
extensive quantities of first-class HYACINTHS,  
TULIPS, CROCUS, NARCISSUS, and other BULBS from  
Holland in lots to suit large and small Buyers.

On view morning of Sale, and Catalogues had.

lots of first-class HYACINTHS, TULIPS, and CROCUS, being  
the surplus selected Stock of a London Seedsmen.

Tuesday Next.

New ODONTOGLOSSUMS, received direct, for Unreserved

Sale.

MESSRS. PROTHEROE AND MORRIS will  
SELL by AUCTION, at their Central Sale Rooms, 67  
and 68, Chancery Lane, E.C., on TUESDAY NEXT, Decem-  
ber 11, at half-past 12 o'clock precisely, 8 Cases, containing  
about 300 plants of ODONTOGLOSSUMS, described by  
the sender as being new. The vendor writes that these Orchids  
are quite unknown in the trade, and were found in a cold region  
about 8000 to 9000 feet above the sea-level. They bloom in  
July and August, grow very freely, and have a large variation  
in the flowers. Dried flowers will be shown at the time of  
Sale.

The Sale will also include a quantity of imported ODONTO-  
GLOSSUM ALEXANDRE, and other ESTABLISHED and  
SEMI-ESTABLISHED ORCHIDS, from Mr. G. T. White; and  
about 100 lots of various ESTABLISHED ORCHIDS and other  
PROPERTIES.

On view morning of Sale, and Catalogues had.

Tuesday Next.

English-grown CAMELLIAS and AZALEAS, and a fine assort-  
ment of GREENHOUSE PLANTS, Standard and Dwarf  
ROSES of the best sorts, selected FRUIT TREES, Hardy  
EVERGREENS, DUTCH BULBS, &c.

MESSRS. PROTHEROE AND MORRIS will  
SELL the above by AUCTION, at the City Auction  
Rooms, 58 and 59, Gracechurch Street, E.C., on TUESDAY  
NEXT, December 11, at half-past 12 o'clock precisely.

On view morning of Sale, and Catalogues had at the Rooms;  
and of the Auctioneers, 67 and 68, Chancery Lane, E.C.;  
and Leytonstone, E.

Wednesday Next, December 12.

15,000 LILUM AURATUM, 50,000 Crown Lily of the  
VALLEY, BARN'S DAFFODILS, English-grown  
LILIES, JAPAN LILIES, 500 AZALEAS and CAMEL-  
LIAS from Belgium, STOVE and GREENHOUSE  
PLANTS in variety, SPIRÆA JAPONICA, various  
HARDY BULBS, Standard and Dwarf ROSES from  
English nurseries, &c.

MESSRS. PROTHEROE AND MORRIS will  
SELL the above by AUCTION, at their Central Sale  
Rooms, 67 and 68, Chancery Lane, E.C., on WEDNESDAY  
NEXT, December 12, at half-past 12 o'clock precisely.

On view morning of Sale, and Catalogues had.

Wednesday Next.—Great Sale of Liliu auratum.

Important to the Trade, 15,000 splendid Bulbs, just received  
from Japan, in excellent condition, and a consignment of  
various other LILIES.

MESSRS. PROTHEROE AND MORRIS  
will SELL the above by AUCTION, at their Central Sale  
Rooms, 67 and 68, Chancery Lane, E.C., on WEDNESDAY  
NEXT, December 12, at half-past 12 o'clock, precisely, without  
reserve.

On view morning of Sale, and Catalogues had.

Friday Next.

1400 PHALÆNOPSIS REGINIERI, ABRIDES MITRATUM,  
CYPRIPEDEUM LAWRENCEANUM, direct importations  
for Unreserved Sales.

MESSRS. PROTHEROE AND MORRIS will  
SELL by AUCTION, at their Central Sale Rooms, 67 and  
68, Chancery Lane, E.C., on FRIDAY NEXT, December 14,  
at half-past 12 o'clock precisely, 8 cases of CYPRIPEDEUM  
LAWRENCEANUM, also 1400 PHALÆNOPSIS REGINIERI,  
and 2 cases of ABRIDES MITRATUM. These plants are  
arrived in excellent condition and will be sold without reserve.

Also about 200 lots of ODONTOGLOSSUMS and other  
IMPORTED ORCHIDS, from Messrs. Shuttleworth, Carder &  
Co., and about 100 lots of various ESTABLISHED ORCHIDS.

On view morning of Sale, and Catalogues had.

Cypripedium insigne Horsmanianum.

MESSRS. PROTHEROE AND MORRIS beg  
to announce that the whole Stock of this beautiful  
variety, named by Dr. Reichenbach, and described in  
*Gardener's Chronicle*, December 15, will be offered for SALE  
at their Rooms in about three weeks. The plant has been  
divided into six, but each plant represents two plants. These,  
together with other new Messrs. F. Horsman &  
Co., will be fully advertised later on.

Sales by Sample.

MESSRS. PROTHEROE AND MORRIS  
desire to announce that their NEXT SALE by SAMPLE  
will take place on TUESDAY, December 18, for which they  
will be glad to RECEIVE NOTICE OF ENTRIES as soon as  
possible.

Orchids in Flower.—Friday, December 21.

MESSRS. PROTHEROE AND MORRIS  
desire to announce that their NEXT SPECIAL SALE of  
ORCHIDS in FLOWER will take place as above, for which  
they will be glad to RECEIVE NOTICE OF ENTRIES as  
early as possible.

Monday Next.—(Sale No. 7820.)

## THE METROPOLITAN BOARD OF

WORKS will meet at the Office of the Board, Spring Gardens, S.W., on FRIDAY the 11th day of January, 1889, at Twelve o'clock, at noon, and will then be prepared to OPEN TENDERS by persons who may be willing to contract for completing the LAYING OUT OF DULWICH PARK, Dulwich, in the County of Surrey. Persons desirous to submit Tenders may obtain copies of the Drawings and Specifications (with Form of Tender) on payment of three guineas. Application to be made at the Office of the Superintending Architect of the Board, at Spring Garden, between the hours of Nine A.M. and Four P.M. (or on Saturdays between the hours of Nine A.M. and Two P.M.), until Thursday, the 10th day of January, 1889. The Tenders, which must be on the form supplied from this Office, and be addressed to "The Clerk of the Board," and enclosed "Tender for Works, Dulwich Park," are to be delivered at the Office before Four o'clock on the last-mentioned day, and no Tender will be received after that hour. The parties tendering must be in attendance at the Board, at Twelve o'clock on the 11th January, 1889. Any Tender which is not fully filled-up in every particular will be rejected.

The Board do not bind themselves to accept the lowest or any Tender.

J. E. WAKEFIELD, Clerk of the Board.  
Spring Gardens, S.W., December 6, 1888.

# HUGHES' Soluble FIR TREE OIL

FLORISTS AND NURSERYMEN SHOULD NOT  
BE WITHOUT IT.

Unsurpassed as an insecticide, it kills effectually all parasites and insects which infest plants whether at the roots or on the foliage, without injury to tender plants—such as ferns, etc., if used as directed. Used as a WASH it imparts the gloss and lustre to the foliage which is so desirable on exhibition specimens.

Dog Fanciers should not be without it! It makes a silky Coat and produces healthy Skin Action; kills fleas, and is excellent for washing dogs.

Housewives should not be without it! Used with ordinary household soap it is an effectual DISINFECTANT, BLEACHER, and CLEANER OF FABRICS. It kills insect life on man, animal, or plant, without injury to the skin, wherever parasites may appear.

Sold by Seedsmen and Chemists, 1s. 6d., 2s. 6d., & 4s. 6d.; ½ gallon 7s. 6d., 1 gallon 12s. 6d., or less in larger quantities.

A Treatise on FIR TREE OIL as an INSECTICIDE, its Application to Plants and Animals, sent Post free on receipt of address, by the Manufacturer,  
**E. GRIFFITHS HUGHES, Manchester.**

WHOLESALE from all the London Seed Merchants, and Patent Medicine Houses.

NEW YORK—ROKER & SONS.

**GISHURST COMPOUND**, used by leading Gardeners since 1859 against Red Spider, Mildew, Thrips, Green Fly, and other Blights. 1 to 2 ounces to the gallon of soft-water; 4 to 16 ounces as winter dressing for Vines and Orchard-house Trees; and in later from the cake against American Blight. Has outlived many preparations intended to supersede it. Boxes, 1s., 3s., and 10s. 6d.

## THE LOUCHBOROUGH GREENHOUSE HOT-WATER APPARATUS.

This is the simplest, cheapest, and most powerful apparatus made. It requires no brick setting, no stove-hole, and no hot-water filter for fixing. The Boiler stands in the

Greenhouse, the front only being outside, so that the whole of the heat from the Boiler itself is utilised. It burns over twelve hours without attention, at a nominal cost.

Price, as engraving, with Boiler, open feed syphon, 12 ft. of 4-inch hot-water pipe, and patent joints, complete, £4 5s.

Cost of apparatus COMPLETE for Greenhouses as below, delivered free, with pipes cut and fitted ready for fixing.

### THE GIANT PRUNER.

*The New and Latest Invention for Scientific Pruning and Training on a large scale.*

The great success of the "Standard" Tree Pruner and the "Myticuttah" has induced us to give our attention to the production of a somewhat similar Implement, but of a much more powerful construction. In the Giant Pruner you have a tool capable of EASILY cutting a branch 7 inches in circumference, with an exerting pressure of  $1\frac{1}{2}$  tons.

Prices and Lengths in future Advertisements.

For Illustrated Price LISTS of above and other Novelties in Pruning Tools, Fruit and Flower Gatherers, &c., apply to the Principal Ironmongers and Seedsmen at home and abroad; or of the

Small size. Length 18 in.  
Price in box, 4/6.

Post-free, 6d. extra.

### "MYTICUTTAAH"

The New and Ingenious Hand to Hand Pruner

(Registered Trade Mark and Title).

Patented in Great Britain, France, and Germany.

Hitherto, strictly correct Pruning could only be done by holding the branch with one hand and using a Knife with the other, but then only for small branches, whereas the "Myticuttah" itself holds the branch, cutting over an inch in diameter, and in case of prickly bushes, &c., it saves the hands from injury. Garden and Lopping Shears, which hack and bruise the branch, are entirely superseded by this new Patent, and its many advantages will at once commend it to the practical Gardener or Forester.

Large Size. 21 inches long.  
Price in box, 9s. 6d.

Sole Proprietors and Makers: **THE STANDARD MANUFACTURING COMPANY, ST. ALKMUND'S CHURCHYARD, DERBY.**

*A New Edition. Fcap. Cloth. Price 7s.*

## MRS. LOUDON'S LADIES' COMPANION TO THE FLOWER GARDEN.

SATURDAY, DECEMBER 8, 1888.

## NOVEMBER IN THE GARDEN.

**H**OW good the saints have been to us this  
 year! One after the other they have  
 given us their little summers; St. Michael, St.  
 Luke, and St. Martin (only that St. Martin's  
 seems to have begun earlier than usual), so that  
 now, in the middle of November, its dark hours  
 are quite lit up by the blossoms in the garden.

Although sharp frost, with snow in many  
 parts on October 1, took from us all tender plants,  
 yet the soft sunlit days that succeeded enriched  
 and prolonged the blossoming of all hardy  
 flowers.

To-day, after a wild storm from the south,  
 the air is soft and balmy. The robin sings in  
 the old Apple tree, among whose yet unfallen  
 amber leaves are twisted sprays of purple  
 Clematis. The crested wren darts here and  
 there among the branches, resting still a moment  
 or two to warble forth her few low, flute-like  
 notes. The thrushes hop leisurely over the close  
 mown grass, and the blackbirds hurry from the  
 fragrant Escallonia bushes with their noisy,  
 startled cry. Let us look around and see what  
 flowers are left us in the heart of November.

Being constantly wind-swept, the walk down  
 the middle of the garden affords the most shelter,  
 for wherever the wind strikes the walls and  
 rebounds with added force there is blackness and  
 destruction to plant life. Thus, in the very  
 centre, are placed our greatest treasures, sure  
 that there they will find the most protection,  
 and utmost calm that is possible on a storm-  
 beaten lull.

On either side of this walk is a broad border  
 filled with old-fashioned flowers, arranged in  
 large groups of colours. Although the position  
 of each plant has been thought over, and planned  
 with regard to its neighbour, the whole effect is  
 that of the most natural and simple possible, no  
 trace of design remaining apparent; on the con-

trary, the flowers look as if tossed from Nature's lap. At the back of the border is a trellis with various climbing plants, and Roses flinging over it their wild wreaths of glossy foliage, still sprinkled with the buds and blossoms of the old Gloire de Dijon, Rêve d'Or, Safrano, and W. A. Richardson. These deep bronzy-leaved Roses make a beautiful background, and how valuable that ever is! Just now the Marguerites are shining out from it in a mass of starry-white blossoms, and Chrysanthemum Madame Desgranges looks like clustered snowflakes, while long-growing white Pansies remind one of the fluttering butterflies of June. How noticeable the healthy vigour of Pansy plants from cuttings made each year in the month of May, from those left undisturbed from one year to the other. *Helleborus maximus*, the earliest of its race, is in full blossom. The Malva bears its milk-white flowers above its rich green leafage. Cyclamens and Iberis clothe the ground beneath, while from the Primrose tufts peep out already the double white buds.

From the abundant summer moisture, *Schizostylis coccinea* is much finer than usual. Large patches of it, with several dozen flowering-spikes open together, are very striking, with their fire-light glow, especially if near the winter Jessamine, that has let fall all its summer leaves to be replaced by golden blossoms along its brown green stems.

The *Schizostylis* well repays division in early spring and replanting in rich soil, for if let remain in clumps for any length of time, the centre dwindles, and only the outer rootlets that run on into fresh soil bear vigorous flower-stalks. For indoor gathering this plant is invaluable, as the blossoms open out in water one after the other, and only need to have the withered ones removed to continue fresh and bright for a considerable time. The old China Roses, though always valued, seem more to be prized this month than any other in which they bloom, their hardy constitution resisting rough weather, and their blossoms content to expand in the slant rays of sunlight from which warmth is fast waning. How cheerful are their clusters of dainty crimson buds! How fresh and delicate the petals of the expanded blossoms! How firm and glossy the deep green foliage! Near to these China Roses are pink Chrysanthemums, *Anemone japonica*, and *Erigeron roseum*, with its pink silken fringe and soft eye of gold. *Lobelia fulgens*, though storm-tossed, still bears its fine bronzed foliage unharmed. With moisture and rich soil this is a really noble plant, but if placed in the vicinity of hungry neighbours, it makes no effort for itself, and the ill-effect is seen in weak growth. Given a covering of leaf-mould, it remains here safe all winter in the open ground. Low growing Fuchsias and Carnations yet linger, while crimson-stained Polyanthus are pushing up through their thick-set leaves side by side with the autumn Cyclamens.

The *Agapanthus Lily*, now past its best, has been beautiful, surrounded by *Agathaea coelestis*, whose charming shade of blue just matches that of the African Lily. This Daisy seeds freely, and a boxful sown in autumn, wintered in a cold frame, and pricked off into small pots, will give nice little sturdy plants for the open ground in May. The blue butterfly blossoms of *Linum provinciale* still hover around it. This is the best of the blue Flaxes, constant in bloom, of a compact growth and pleasant foliage. Stray Campanula blossoms are still to be found, and little sprays of Forget-me-Not wander here and there.

Michaelmas Daisies have been especially fine in all their varying shades of blue, mauve, and amethyst. Divided each spring, replanted in rich soil and with only a few stems left, the flowers are so much larger, and the branched growth so much prettier, that one hardly recognises them as the same plants which one generally sees tied to a stake in a thick mass like a broom—enough to disfigure any flower border. The

double lilac *Colchicums* are still in flower, they have made a spring bulb bed very beautiful since October began, having with them *Cyclamen hederifolium*, whose purple-pink blossoms blend with those of the autumn Crocus admirably. These Cyclamens form a thatch over a border of Hyacinths, that spring up in profusion between the corns in their own season.

Melladores, the Roman *Ranunculus*, have been quite a feature in the garden this autumn. From seed sown in spring and grown quickly on, they, like the *Anemone coronaria*, begin to blossom in August or September. No doubt their flowers will yield to the first heavy frost, as they have not the fine resisting power of the *Anemones*. These Melladores are of a clear yellow, gold colour, slashed with chestnut-red and pure crimson. Spring and autumn have indeed met together in the garden when I gather these *Ranunculus* with a handful of yellow Oxlips and sweet Violets, and see around me the Chrysanthemum, late Roses, the Cactus Dahlia, and *Datura sanguinea*. These latter two had their young leaves blackened on October 1, but have since recovered.

As the *Helianthus* blossoms are fading the *Doronicums* spring up anew, with fresh flowering stems that bear large, gold-edged blossoms. The yellow Daisy, *Etoile d'Or*, is covered with bloom. Gold and orange-brown *Calcarias* are yet fine, tall yellow Chrysanthemums are letting fall their weight of blossom beside the *Rudbeckias*, and the old yellow *Auriculas* are pushing up their powdered heads.

Sunshine, and flowers such as I have not counted over, make bright the hours of "dark November." L. A. L.

## NEW OR NOTEWORTHY PLANTS.

### LILIUM (ARCHELILION) HENRYI, Baker, n. sp.\*

The two parts of the world from which new and interesting plants are at present pouring in at the most rapid rate are Western China and Madagascar. We have just received at Kew from our indefatigable correspondent, Dr. Henry, a fine series of dried specimens of Lilies of the province of Ichang. Amongst them are *L. giganteum*, *L. tigrinum*, *L. longifolium*, *L. Brownii*, and a fifth species which is evidently new, and which I propose to name after its discoverer. In general habit it most resembles *tigrinum*, but the fully-developed leaves more recall those of *auratum* and the narrow perianth-segments those of *polyphyllum*. As to its horticultural merits I will not venture at present to express any opinion. Both this and its geographical neighbour, *L. Davidi*, of Duchartre, still remain to be introduced in a living state.

Bulb globose, 2 inches diameter; outer scales ovate, fleshy,  $\frac{2}{3}$  inches long by half as broad. Stem 2-3 feet long below the inflorescence,  $\frac{1}{2}$  inch thick at the base, furnished with close erecto-patent subsessile leaves up to the very top. Fully developed leaves lanceolate, 6-8 inches long, 1-1 $\frac{1}{2}$  inch broad below the middle, tapering gradually to a long point, moderately firm in texture; upper gradually smaller, those of the uppermost half foot of the stem ovate, 1-1 $\frac{1}{2}$  inch long. Inflorescence a lax corymb sometimes a foot in breadth, consisting of four to eight flowers, bracteated at the base by a whorl of small ovate leaves. Perianth yellow, 3-3 $\frac{1}{2}$  inches long; segments lanceolate, sub-obtuse,  $\frac{5}{8}$ - $\frac{3}{4}$  inch broad below the middle, spreading from the middle when the flower is fully expanded, marked in the lower half with a few irregularly-scattered minute red-brown spots, furnished at the base with a sort of linear nectary  $\frac{1}{2}$  inch long, which is some-

times, but not always, fringed with a few subulate concolorous papillae. Stamens as long as the perianth-segments; anthers linear,  $\frac{3}{4}$  inch long. Ovary sub-cylindrical, an inch long. Capsule oblong, obtusely-angled. J. G. Baker.

### LÆLIA ANCEPS AMESIANA.

With the wide range of beauty which the new white and coloured varieties of *Lælia* anceps imported of late years have brought us, it takes a very fine novelty indeed to rank as first-class among them. Such a one, about which there can be no two opinions, is now in flower in the Orchid establishment of F. Sander & Co., of St. Albans, and has been dedicated by them to that enthusiastic orchidist F. L. Ames, Esq., of Boston, Mass., U.S.A. The outline of this superb flower is exactly that of *L. a. Dawsoni*, and it has the same firm substance and wax-like appearance of the petals, and which are 1 $\frac{1}{2}$  inch in width, the flower in its full expanse being 4 inches. The sepals and petals are pure white, with a delicate pearly blush on the outer halves; the sepals have at the apices an emerald-green dot, and the petals a crimson feather at their tips, after the manner of *Cattleya Trianae* *Bachousiana*. The labellum is altogether extraordinary. The side lobes forming the tube are white outside, and yellow inside streaked with purple; the mouth of the tube being prettily turned back so far as its bluish-white margin extends—about one-eighth of an inch; a raised rich orange-coloured keel of three ridges extends up the middle of the labellum, finishing in one ridge on the front lobe, whose rich violet-crimson colour excels that of all other Mexican *Lælias*. The plant may be a cross between one of the *Dawsoni* type and a coloured *L. anceps*; but where such a rich and dark labellum comes from it is impossible to say. It appears that this treasure was bought by E. Harvey, Esq., of Riverdale, Aigburth, Liverpool, from St. Albans, in July, 1883, and it now finds its way back again at 200 guineas. J. O'B.

## PLANTING SANDHILLS.

This interesting and important operation is commented upon at pp. 389, 447, and 845, and valuable information, success and failure, have been recorded. Your correspondent at p. 447, recommends the best plan suitable for such an object, viz., by using wattled bundles on the seaward side of the plantations, but evidently he has abandoned his useful and good work. Still, after all, planting has been successful in such positions, and under such difficulties as boisterous winds, shifting sands, and all the other evils mentioned.

The best recommendation I can suggest, is to follow Nature's plan; and the best illustration of this is found in a description of how this very thing has been accomplished on the sea coast of France.

By Nature's plan, I mean, first, suitable shelter; 2ndly, sowing seed and trusting to seedlings in the first instance, instead of planting; and 3rdly, supplementing this by planting better and more varied shrubs and trees when the planting is sufficiently advanced to shelter both the trees and that which they would be intended to decorate—a residence or garden.

This information is derived from a report by Major J. Bailey, R.E., on forestry in France, and this particular extract refers to "the dunes of the west coast of France." The winds that blow continuously from the ocean on the west coast carry with them enormous quantities of sand, which, advancing steadily over the country at the average rate of some 14 feet per annum, in the form of moving hills, called dunes, bury under them the fields and villages they reach. It has been calculated that nearly 90 cubic yards of sand per yard of coast-line are thus annually transported inland. Works to arrest the destructive effects of this invasion of sand have been in progress since 1789; they were originally carried out under the Department of Public Work, but since 1862 they have been placed under the Forest Department. The total area of the dunes is

\* *Lilium (Archelilion) Henryi*, Baker, n. sp.—Bulb globose, tunicis magnis ovatis, caulo 2-3 pedali crebre foliato, foliis alternis lanceolatis semipetiolatis supremis reductis ovatis, floribus 4-8 in corymbum latum dispositis, perianthio luteo segmentis lanceolatis fere expanso ad medium patulis infra medium punctis parvis paucis rubro-brunneis decoratis ad apicem parvis papillis, staminibus limbo-sequalibus.

said to be 224,154 acres, a part of which belongs to the State, and a part to private owners, while a much smaller part is communal property.

Now follows the plan. In exposed situations the protective works consist of a wooden palisade (I would also add turf walls), erected at a short distance above high-water mark, and destined to promote the formation of an artificial dune, with a view to prevent fresh arrivals of sand from being blown over the country.

Under the shelter thus formed seeds of various kinds, principally those of the maritime Pine (*Pinus maritima*)—so far north I would suggest *Pinus austriaca* and *sylvestris* also—Broom, common Whin or Gorse, and Arundo arenaria are sown, the seeds being covered with brushwood to prevent the sand in which they are sown from moving, and the sowing is thus continued inland in successive belts, until a crop of trees is raised on the entire area.

In less exposed situations a walled fence is substituted for the wooden palisades. In the Departments of Gironde and Landes forests of the maritime Pine have been most successfully raised in this manner, the trees being tapped for resin, and the wood of those which have been exhausted being sold for sleepers and other purposes.

North of the Loire the maritime Pine is not sown, as in that region it does not yield a sufficient quantity of resin to repay the cost of its introduction, and here it is sought merely to establish a crop of grass on the ground. The French law of 1810 relative to the treatment of the dunes, which is still in force, provides that the Government can order the planting up of any area which in the public interest requires to be so dealt with. "Surely one of the pressing reforms in our own country."

When the land or any part of it belongs to commons or private owners who cannot or do not wish to undertake the work, the State can execute it, reimbursing itself with interest from the subsequent yield of the forests. As soon as the money so advanced has been recovered, the land is restored to the owners, who are bound to maintain the works in good condition, and not to fell any trees without the sanction of the Forest Department. Before the Department took over the work of re-forestation in 1862, 111,787 acres had been dealt with, and the entire area—more than 224,000 acres—has now been completed. The works have to be carefully maintained, in order to prevent a recurrence of the evil.

Referring now to p. 545, Major Bailey's remarks are worth repeating. Forests are not so exhausting to the soil as agricultural crops. In the case of the latter the entire plant, except the roots, which also are sometimes taken, is removed, whereas with a crop of trees the leaves, flowers, and fruit, which are far richer in nutritive elements than the wood, are annually returned to the soil, and thus serve to maintain its productive power, as well as by their protective action to keep it in a good physical condition. Hence forests can flourish on comparatively poor soil. *Wm. Clark, Carlisle.*

## CULTURAL MEMORANDA.

### SPIRÆA JAPONICA.

This winter and spring-flowering plant is almost indispensable as a decorative subject, and no time should be lost in potting up the desired number of clumps. The soil used may consist of three parts light sandy loam and one of leaf-mould. Stand the pots on fine coal-ashes in a cold pit, whence small batches can be drawn for forcing. The *Spiræa* is a moisture-loving plant when in growth, therefore it should be well watered once, and sometimes twice a day. Liquid manure applied at the roots three or four times a week, will also have a satisfactory result; failing this an occasional surface-dressing of Beeson's manure before giving water at the roots will answer the same purpose.

### LILY OF THE VALLEY.

All home-grown, and imported crowns and clumps should now be potted. Several "crowns" may be packed closely together in 4½-inch pots, in a compost consisting of about three parts light sandy loam and one of leaf-mould, working it around the roots in the process of potting, keeping the crowns just above the surface of the soil. The same remark applies to the potting of the "clumps," which should be potted according to their size, into 4½, 6, and 7-inch pots. The great secret in the early forcing of Lily of the Valley is to exclude light and air from the crowns until they have shown the flower-spikes, when they should be gradually inured to light, by placing them on a shelf, in the forcing-house, with an inverted flower-pot placed over them for a few days. The plan of plunging the pots a few inches underneath a covering of leaf-soil, in the Mushroom-house, or in a box of sawdust placed under the staging in a forcing-house, or anywhere in a temperature not below 50° or 55°, keeping the material in which the pots are plunged on the moist side, is, I find from long experience of its use, a capital one.

### CLIVEA MINIATA.

flowers during the winter and spring months, and is easily increased by divisions of the crown being potted any time after the plants have flowered. Use a mixture of four parts sandy, fibry loam and one of leaf-soil, with a dash of sharp sand, putting the plants in a moist, warm pit or house, and giving sufficient water at the roots to settle the soil. After the roots have pushed well into the soil, occasional applications of weak, tepid, liquid manure will prove beneficial. Unless the plants are intended to be flowered in small pots, they should be shifted into larger pots as soon as the roots have reached the side of the pots.

### AGAPANTHUS UMBELLATUS.

This is of very easy culture. Divisions of the crowns potted into 6-inch pots in any kind of moderately rich mould, and placed in a minimum temperature of from 50°–60°, and watered, will soon become established, requiring frequent shifts into larger pots until the desired size has been attained to. They are gross feeders, and, therefore, should have copious supplies of weak liquid manure during the period of growth. This will aid the production of flowers. Large plants stood out-of-doors have a good effect.

### CHRYSANTHEMIUM.

Cuttings for next year should be taken as soon as they have made between 1 and 2 inches of growth. Insert round the sides of 3-inch pots filled with any kind of mould surfaced with sand, and placed in a cold frame near to the glass, or, better still, a pit where a little heat can be employed occasionally to dry up excessive moisture, and so prevent the cuttings from damping off. None but good sturdy cuttings from the base of the plant should be taken. As soon as the cuttings are rooted, sufficient air must be given to insure a stocky growth. *H. W. Ward.*

## PLANTS IN FLOWER AT KEW.

THE following are the most interesting of the plants now flowering in the Royal Gardens, Kew:—

*Gladiolus recurvus*.—This plant commenced to flower early last month. It belongs to the small-bulbed Rush-leaved kinds, of which *G. tristis* is the best known representative. The former has leaves a foot long, a scape 18 inches long, bearing two or three flowers which have spreading recurved segments 1 inch long, and coloured yellow, thickly spotted with brown. The flowers are dull in colour, but very powerfully fragrant, and they remain fresh a fortnight or more. This species was the first *Gladiolus* to flower last winter, as it is this.

*Hemanthus Baurii* flowered for the first time at Kew in 1883, and it has been in bloom every year since. The plant now flowering has two short broad

recurved leaves, and a short erect scape projecting from the centre. The broad, petal-like spathe-valves are pure white, margined with emerald-green, and enclose the cluster of white erect flowers. This species bears some resemblance to *H. albifolius*, but the latter has longer scapes, shorter spathe-valves, and usually three or four leaves. *H. Baurii* is figured in *Bot. Mag.*, t. 6875.

*Reinwardtia tetragyna* is a most valuable winter flowering plant, much superior to *R. trigyna* (Linum) both in the manner of flowering, in the shade of yellow, and in the length of time it lasts. There are several groups of it in flower in the Begonia-house. For warm conservatories this plant deserves a very strong recommendation.

*Thunbergia laurifolia*.—This is an old stove-flowering climber, which produces its large handsome lilac-and-white flowers at various seasons. A fine example of it is in bloom in the Victoria-house. Its neighbour is *Ipomœa Briggsii*, a very pretty and floriferous form of *I. Horsfallii*.

*Vitis pterophora*, better known as *V. gongyloides* is also in this house, and is interesting just now on account of the swollen bulb-like character of the terminal internodes or joints of the principal shoots. These, when ripe, dehisc naturally, and falling to the ground, soon develop into plants. They are a near approach to propagation by cuttings on the part of Nature herself.

*Bromeliads*.—The most attractive of these plants now are *Billbergia vittata* Bakeri, a hybrid, also known as *B. Cappei* and *B. Brentana*. It is a handsome plant, 18 inches high, with semi-erect leaves, and an arching branched panicle of blue flowers, subtended by large boat-shaped bracts of brilliant crimson. *Echmea calyculata* is a dense-growing plant with erect dark green leaves, about a foot long, and compact heads of yellow flowers on peduncles a little longer than the leaves. *Æ. Barlei* has stout leaves arranged in a vaseform manner, and margined with large spinous teeth. The inflorescence is a long, arching, branched panicle, with small flowers and large crimson bracts. *Æ. mexicana* is a strong grower, nearly a yard across, with grey-green leaves and a stout panicle of flowers, the small blue petals just protruding beyond the grey nut-like calyx.

*Leuodica gratissima* is an unusual attraction in the greenhouse (No. 4). It is very good this year, the heads of bloom being large and full. A second plant, with smaller leaves, looser flower-heads, and the corolla smaller, is called variety *glabra*. It is what is cultivated in some gardens—as, for instance, Birmingham Botanic Gardens—as *L. Pinciana*, but it is not that plant. Is true *L. Pinciana* in cultivation anywhere? It has white flowers, larger than those of *L. gratissima*, and with a raised callus, almost a corona, about the base of the lobes of the corolla.

*Pleroma macrantha* (*Lasiandra*).—A first-class winter-flowering plant, if grown in a sunny position in a warm greenhouse; indeed, it is rarely out of flower. Two plants in the greenhouse (No. 4) are now covered with large purple-blue flowers.

*Callistemon rigidus*.—The large bush of this handsome Australian plant is now flowering freely in the south octagon of the Temperate-house. What beautiful flowers it bears! Exactly the form of a bottle-brush, the bristle-like stamens bright crimson, and each one tipped with a golden anther. It will continue to flower for some weeks yet. These plants, and the equally handsome *Beaufortias*, are rarely seen in English gardens now. There were some pretty examples of them exhibited at Ghent this year.

*Lilium nilgherrense*.—A little group of this large-flowered Indian Lily is flowering in the Temperate-house. It is an interesting species, not so pure a white as *L. longiflorum*, but well worth growing for the sake of its flowers at this season. It is almost hardy. The flowers are 8 inches long, narrow in the tube, 5 inches across the limb, segments recurved, the three inner ones 2 inches across. Colour creamy-

white tinged with green in the throat, wholly green on the tube.

*Dracena fragrans* var. *Lindenii*.—This is the well-known *D. Lindenii* of gardens. It is handsomest when young, old plants becoming much greener. The plant now flowering in the Palm-house is 7 feet high. The inflorescence is terminal, and in the form of an erect branched panicle, with small white pale yellow flowers.

*Orchids*.—Amongst *Masdevallias* in flower are *M. pulvinaris*, a very remarkable species, with tall peduncles, bearing the purple-brown flowers reversed (lip upwards), and with two oblong, fleshy, yellow processes on the inside of the two upper sepals. *M. Moorei*, or *melanoanthera* has large flowers with a chined cup 1 inch across, and three tailed sepals 3 inches long. Colour purple on lower sepals, upper creamy-yellow with purple lines. The labellum is large, and black-purple. *M. platyglossa*, with dull yellow papery pendant flowers; *M. cucullata*, with large deep black-purple flowers; *M. polysticta*, *M. Carderi*, *M. bella*, *M. Vallisii*, *M. macrura*, *M. melanopus*, and others, are also now in flower. A rose-coloured variety of *Sophronitis grandiflora* is blooming close to flowering examples of the type. *Cirrhopetalum Wightianum*, with a long peduncle, suddenly bent at the upper end, and bearing yellow flowers, in which the only conspicuous parts are the two long sepals, united by their inner edges and projecting outwards; *Pholidota conchoidea*, like *P. imbricata*, but larger; *Cattleya labiata*, autumn-flowering variety; *Huntleya marginata*, *Cologne* *Gardneriana*, *C. rigida*, *Polystachya laxiflora*, *Catasetum Garnettianum*, *C. fuliginosum*, *C. macrocarpum*; *Bolbopogon striatum*, and a very fine variety of *Odontoglossum Harryanum* with nine flowers on a spike, are the most noteworthy of the Orchids now in bloom. *W.*

## NOTES FROM A NATURALIST IN MEXICO.

WHEN at last one arrives at the so-called Valley of Mexico—which is not a valley in the usual sense of the word, but rather a high-lying plateau, containing large lakes which receive the drainage of the hills around, and have no natural outlet—one expects to see a view of unparalleled grandeur, but this is, like many other popular impressions, by no means the case. The distant cone of Popocatepetl and the more picturesque mountain of Ixtaccihuatl, which, though somewhat lower, has more snow at present on it, are no doubt very high and remarkable mountains; but their distance, the haze through which they are seen, and the want of beautiful foreground in the view, make the scene, in my opinion, infinitely inferior in grandeur and in impressiveness to many of far less reputation, both in the Alps, the Pyrenees, and the Himalayas.

As to the climate, one must not be too critical at this season, especially when one has just left a winter of unusual severity, both in the United States and Europe, but it is not my idea of a tropical or even a very nice climate. Bright sun and continual almost cloudless sky, cool air, even cold in the morning, with glare and dust, are the characteristics on the plateau and highlands of Mexico for five or six months of the year.

Pine forests, which I had always expected to find one of the features of the country, are diminishing yearly through the unchecked devastations of fire, charcoal-burners, goats and sheep, and I have not yet seen a tract of forest which has not been much injured in this way, or of which the more accessible parts have not been, in a great measure, destroyed. To find this one must go up to 8000 or 9000 feet on the slopes in the environs of the City of Mexico, so tempting to a naturalist at this season. We lost no time in going on to Orizaba, about two-thirds of the way in distance to the east coast, and at little more than half the elevation of Mexico City.

Here, in the midst of Coffee plantations, Sugar-cane and Bananas, with the volcanic peak of Orizaba,

17,000 feet high, at a short distance, one can find, by looking for them, some really charming bits of forest, but always in deep gorges or barrancas, and never in easily accessible situations. Birds, as in the Valley of Mexico, are numerous and varied, but not especially striking in colour, size, or form. Butterflies are fairly numerous, but mostly belong to the family of *Hesperidae*, which alone are common at this season. Moths, excepting a few day-flying *Agriæ*, are scarce, and other insects, excepting dragon-flies, not very showy or numerous. Orchids are fairly abundant, but few showy ones are now in flower, and though the gardens and plantations round the town are full of beautiful, showy plants in flower, of a more or less tropical character, such as *Hibiscus*, *Erythrina* and *Datura*, yet most of them are exotics. A fortnight's stay in Orizaba enabled me to explore the environs pretty thoroughly without finding a single spot within five or six miles which could be called a first-class collecting ground, though at the same time I feel sure that Orizaba would yield a very large number of plants, birds, and insects, to a resident collector. Tuxpango, about three hours to the south-east, is the best place I found, and here are some very picturesque waterfalls, and a lovely tropical gorge, with some fine Coffee plantations under the shade of the forest, which pleased us more than any spot yet visited. On the mountains around Orizaba, which, however, are very steep and pathless, there are some rich and interesting spots in which I found a few fine plants and rare insects; but the sky, though generally bright in the morning hours, usually clouded by noon, and the weather was not nearly so hot as one would expect in latitude 19°, at 4000 feet elevation.

Going on from Orizaba towards Vera Cruz, one passes through a very rich and fertile country, where Bananas, Pine-apples, Coffee and Sugar are largely grown about Cordoba, and here in the plantation of M. Tonel, a Belgian gentleman, who has been settled in Mexico for many years, I saw a large number of species of Palms, and very many interesting and beautiful tropical and sub-tropical plants. Indeed, I should say this was by far the most interesting garden in Mexico, as the proprietor has a Belgian gardener, and goes to much trouble and expense in making his plantation rather a botanic garden than an ordinary Coffee plantation. But still there is no virgin forest until one gets on towards Attoyac, where the railway passes through some scenery of the true tropical character, and in the few hours I was able to spend here I saw what I had been hoping for so long. As, however, Attoyac is said to be very unhealthy at all seasons, and there is no accommodation for a stay, I could only regret my inability to give it a thorough exploration, though probably there is no great amount of novelty to be expected, this part of Mexico having been better worked by naturalists than any other.

Below Attoyac you get into the dry plains bordering the coast, which are for the most part covered with low, thorny, or scrubby forest, or coarse dry grass, and infested with small insects called "pinolillos," which, judging from the amount of precaution and trouble the inhabitants take to get rid of them, must be very disagreeable indeed. A gentleman who got into the tram-car on our way up to Jalapa, two stations out of Vera Cruz, had got amongst these "pinolillos" in passing through some bush, and spent over half an hour, with the assistance of several other passengers, in picking them out of his clothes. A magnificent yellow-flowered tree, figured in Broderick's *Central America*, was the most conspicuous ornament, at this season, of these dry, low-country jungles, for I can hardly call them forests, and here alone have I as yet seen Palms growing as a conspicuous feature in the scenery, though several dwarf and slender climbing Palms were common in the gorges about Orizaba and Attoyac, together with two fine plants belonging or allied to the *Musaceæ*, both in flower at this season.

Vera Cruz, though unusually cool and healthy for the time of year, owing to the heavy northerly gales which have prevailed during most of the month of

March, and which account for the cloudy, cold weather at Cordoba and Orizaba, is not a place that would tempt any one travelling for pleasure to stay in; and as its hotels are detestable, we lost no time in getting off to Jalapa, which lies on the eastern slope of the mountains about fifty miles north of Orizaba.

The old road up to Jalapa is said to give an excellent idea of the gradual change of climate and vegetation from the coast upwards; but if this is true, I cannot say the same of the new tramway, which takes one over the forty miles and 5000 feet of ascent in about eleven hours, mules being the motive power, as on many other lines of Mexico. The first half of the way is all through the dry coast jungle, or chaparral, as it is here called, full of *Mimosas* and other thorny trees and bushes. *Bromeliaceæ* are very conspicuous and abundant, as in most parts of this region, and several very fine arboreous *Bonapartes* and gigantic *Cereus* were common at about 2000 feet. But on the whole line there is not a single mile of forest which can be called fine or luxuriant, and water is so scarce that the villages on the route are both few and poor. One fair-sized river is crossed at Puente Nacional, and here we saw some lovely flowering trees, though the speed of the mules, except on steep ascents, did not allow much botanising. A very graceful, feathery Bamboo, growing about 15 feet high, appeared at about 3000 feet in one place only on the road, growing gregariously among shrubs and trees, but beyond this I saw nothing very striking. When we got up to about 4000 feet, an open, grassy country, with occasional trees, and small groves in the ravines, was entered, which, through the influence of a small driving rain and dense mist, made the country look more like the Highlands of Scotland than Mexico; but, notwithstanding the cold, hedges of wild Pine-apples showed that the mean temperature must be high.

Jalapa itself, when reached, is decidedly the most enjoyable place of residence for a naturalist that I have yet seen in America. The climate is damper and cooler than that of any place of similar elevation I have seen. There are numerous bits of very charming country of varied character within a walk of the town. A very tolerable hotel, curé, and law-abiding inhabitants, a capital naturalist's servant, named Alysio Trujillo, who accompanied us for some time, and can both shoot and skin birds well, and fine weather, all combined to render our stay at Jalapa a bright and delightful sojourn. There is between Jalapa and Coatepec a good deal of real virgin forest, abounding in plants, birds, and insects, and having at least two broad and good roads through it, without which collecting in a virgin forest is so difficult and incomplete. At this season the forest, which consisted largely of Planes, Oaks, Liquidambers, and other trees of a temperate aspect, was dry and pleasant to go about in, and numerous small clearings in it made a variety which, if not carried to the extent which it generally is, is favourable to all animal life.

On the north side of the town, at about an hour's distance, is a delightful park-like, grazing country, covered with groves of trees, and intersected by richly-wooded gorges, a very paradise for birds, and having in fine weather a perfect climate, though it is said that the rainy days in the year outnumber the fine ones. Farther on towards the north we did not go, but Mr. Godman, who spent a month in and about Misantla, three days' ride north of Jalapa, describes the deep descent from the table-land to the dense forest as very fine, and the country extremely rich and productive to a naturalist. North-west of Jalapa is the Confe de Perote, a volcanic mountain 13,000 or 14,000 feet high, with fine Pine forests on its slopes, but at this season the high country was too cold to visit for collecting purposes, and I am unable to say whether the Pine forests on this slope are as much damper and richer in herbaceous plants and accompanying insects than those of the central plateau, as one would expect them to be.

We returned from Jalapa to Cordoba on horse-

back; a ride which for varied vegetation, beautiful scenery, and general interest, would be hard to beat in Mexico; and though on two of the five nights spent on the road our lodgings were of a very primitive character, yet a lady was able to enjoy it thoroughly. Some of the barrancas—five crossed on this ride—are very deep and perpendicular; two rivers have to be passed on rafts, the horses swimming or wading, but the ride along the edge of the Barranca de los Pescados, ascending from 2000 to about 5000 feet, on the second day, has many very fine views indeed, and the peak of Orizaba, both on this and the next day, is an object of culminating importance. In the Oak forest near Las Balsas, Bromeliaceae, Orchids, and other epiphytes were in the greatest abundance. I gathered thirteen or fourteen species of Orchids in an hour from the low trees without getting off my horse. This was between 3000 and 4000 feet, but a few miles further on we got into a region where, though the forest was much finer and denser with green undergrowth, Orchids were not so numerous or varied.

We saw a fine dark crimson Hibiscus, with a trailing habit, in this part of Mexico only, and a splendid Gesneriaceae plant of great size growing in the damp, shady ravines, together with many Tree-ferns and other large and handsome Ferns, which seemed more abundant about San Bartolo than anywhere I have yet been. In fact, we thought San Bartolo as good a place for collecting as any in this part of the country. It is charmingly situated in the midst of a good deal of virgin forest, at about 5000 feet, and within easy reach of deep, hot gorges, full of purely tropical vegetation, and close under the high slopes of the volcano of Orizaba.

Beyond Huatusco, where we slept on the third night from Jalapa and found very fair quarters, the country becomes less broken and picturesque, though still very pretty. Returning to the high plateau of Mexico, we found the contrast between the dry, dusty, windy climate, and the region we had just left, even more striking than at first. Round Puebla, where we stayed a week, there is little or no indigenous vegetation, except here and there on dry rocky hills, and in the few places where the soil is too poor for cultivation. The Malinche, an extinct volcano of 13,000 feet, is covered on its lower slopes with stunted Pines, which are fast succumbing to the attacks of the woodman and charcoal-burner; but the only spot where we have found any forest at all likely to contain much of interest is at El Pinal, about twenty-five miles out on the railway leading to Los Llanos, and here are a good many birds and insects quite different from those yet seen, and some Vaccinias and other plants, which are apparently quite at home on the dry sandy granite of which these hills seem to be mostly composed. *H. J. Elwes, Cirencester, in "Garden and Forest."*

## ORCHID NOTES AND GLEANINGS.

### ORCHIDS AT BURFORD LODGE, DORKING.

THE hybrid Calanthes in Sir Trevor Lawrence's collection always makes a bright feature at this season of the year, and each year seems to add new beauties. There is a brilliancy of colour in the coloured varieties and a softness of tints in the paler ones, which also include some sulphur-yellow tinted forms, and which seem to be peculiar to the Burford strain and are unapproached by any other. Among many now in bloom, *Calanthe burfordiensis* is the richest in colour, its flowers being like C. Sandhurstiana, but far more brilliant—a vermilion hue tinging its carmine-crimson flowers. C. Veitchii splendens is almost as fine in colour, but has a light eye in place of the dark crimson of C. burfordiensis; C. V. lactea is a charming milk-white flower; C. V. rosea, a delicate pink; C. canabilla, a very distinct and delicately-tinted kind, and C. nivea, a profuse flowering white. These are all hybrids from C. Veitchii, which gives a race with good constitution, profuse flower, and producing their flowers at a most desirable

season. Sir Trevor Lawrence also has many new and delicately tinted unnamed kinds of the same strain. Of the C. vestita section the Burford seedling named C. v. aurantiaca, with very large flowers with orange eye, faintly suffused with pink, excels all the rest, and now that there are large specimens of it with many spikes of flowers, they exceed all expectation. The pretty C. bella and the curious hybrid raised here between *Limatodes labrosa* and C. vestita are also in bloom, the latter with purplish sepals and petals, and yellow lip marked with purple.

Garden hybrids have now become one of the most interesting features in several Orchid collections, and especially at Burford where so many fine things have been raised, and a numerous progeny is coming on, especially of *Cypripediums*, of which the Burford variety of C. Leeanum named maculatum now in bloom offers a good example. Turning to the *Dendrobium* crosses the grand hybrids raised between D. Findlayianum and D. Ainsworthii, named respectively D. chrysodiscus and D. melandiscus, and the no less beautiful D. chlorostele (D. Linawianum × D. Wardianum), are showing well for flower, and other nurslings expectantly watched: with them the perpetual flowering D. rhodostoma is producing its rich claret-tipped flowers, and the D. splendissimum grandiflorum has in the past season proved again its superiority over all the Ainsworthii family.

In the numerous Orchid-houses at Burford, whose occupants Mr. Bickerstaffe fails not to keep up to the mark—and that is not an easy task where rare things abound—plenty of oft-noted things are in bloom, but among the rarer and remarkable were the scarlet *Epidendrum cinnabarinum* Moseni, the curious true E. scepterum, with numerous spikes; the richly tinted best variety of E. phoeniceum, E. Wallisii, and other *Epidendrums*. *Cypripedium Harrisianum* superbum (Burford variety), a richly coloured giant among the Harrisianums, C. H. nigrum, C. nitens, C. insigne Moorei, and many other varieties of C. insigne, and others.

At present three distinct varieties of *Mormodes* buccinator are in flower—one with clear yellow, another with white flowers spotted with pink, a third with handsomely mottled cinnamon and chocolate-coloured flowers, and there is yet another, which has reddish-purple blooms. Well might Lindley call it the most variable of the *Mormodes*. *Cynoches chlorochilon* is in bloom, the new and singular C. versicolor, just over; and *Catasetum Bungei* thii, C. macrocarpum, and others of these curious Orchids, are in flower or bud.

*Lelia anceps* (white and coloured) are well advanced in bud; L. a. Sanderiana, which is one of the finest, having five spikes; the richly coloured L. a. Protheroeana, too, introduced by Mr. F. Horsman, of Colchester, is a grandly formed flower; there will be a fine show of Mexican *Lelias* soon, and already some superb L. autumnalis atro-rubens are open and a large specimen of L. Gouldiana with five spikes is well advanced. The *Masdevallias* have some chimeras, M. hieroglyphica, a large pot of M. racemosa Crossii, M. Chelsonii, the pretty M. ludibunda rosea, and others in bloom, and other extra fine or rare things in bloom or bud are *Vanda Amesiana*, *Spathoglottis angustorum*, *Dendrobium streblloeras*, *Odontoglossum Harryanum*, O. Krameri, *Cattleya maxima* Backhouseana, with finely veined lip, sepals and petals; *Sophranitis grandiflora* coccinea, *Esmeralda Clarkei*; *Aerides Lawrenceana*, *Angraecum Chaillunum*, A. pertusum, *Lycastes*, *Maxillarias*, *Pleiones*, &c.

### ORCHIDS AT CASTLE HILL, ENGLEFIELD GREEN.

The small but increasing collection belonging to G. C. Raphael, Esq., now that it is under the care of such a grower as Mr. Swan has proved himself to be, bids fair to rank among the more important ones. Upwards of fifty distinct species and varieties of *Cypripedium* are represented by very fine and healthy specimens, among which a good display of bloom is given by the varieties of C. insigne and C. Spicerianum, and lesser quantity by some of the

hybrid forms, and the *Calanthes* very effectively arranged along with them.

In the cool-house the pretty violet *Odontoglossum Edvardii* has a very strong spike, and many other *Odontoglossums* are in flower, as well as *Masdevallia chimera* and other *Masdevallias*, and fine pans of *Pleione*; and the plants of *Cattleya citrina* suspended overhead exhibit extraordinary vigour. The *Phalenopsis* and *Angraecums*, too, in the house here devoted to them are very promising for a good show of flowers in their seasons.

### ORCHIDS AT THE GRANGE, HACKBIDGE.

The great success which has attended the experiments of growing Orchids for the four warm months in the open air in the Fern Valley in the noted garden of A. H. Smea, Esq., whose doings in that direction have been repeatedly recorded, must have done much good by showing that it is at least unnecessary to give many Orchids the high temperature to which they are subjected in some gardens. The whole of the Orchids at The Grange are grown under very cool treatment, and it is only a representative selection which is placed outdoors in summer, but when this selection is returned to the houses for the winter the improvement by outdoor sojourn is very marked in many cases, and deteriorations infrequent. It is also advanced that the plan's grown outdoors in summer are much less liable to be injured by cold in winter. If we may take a great specimen of a fine variety of *Odontoglossum leucopurpureum* with two very large spikes now in bloom as one example, the summer holiday in the open air is beneficial, and that it is so, is also borne out by some fine *Lycastes* and other things now in bloom, and the stout growths of *Dendrobium Wardianum* and other *Dendrobiums* made in the open air, but Mr. Cummins (the gardener here) who takes such an interest in these experiments, remarks that they require as much attention when growing out-of-doors as if they were kept in the houses.

*Disas*, *Satyrums*, and other Cape terrestrial Orchids, too, are very successfully managed in frames from which the frost only is excluded by covering up in hard weather. Here many fine *Satyrums* and *Disas* have flowered, and notably the blue one, which grows now begin to understand. A fine variety of D. graminifolia is now in bloom, and the rare D. lacera (see fig. 93, p. 664), with its beautiful blue and purple flowers, remained in flower over six weeks.

The flowering Orchid-house is that which was illustrated in *My Garden* as the fernery, but now the flowering Orchids are set up in it, and are delightfully effective when so arranged. At present some great masses of several varieties of *Oncidium protextum*—one with two spikes of over a hundred flowers—are very effective; and *Oncidium Forbesii*, O. abortivum, O. raniferum, O. varicosum, and a varied display of *Odontoglossums* look well with their sprays hanging over the frondage of the Ferns. Many varieties of the pretty *Barkeria* elegans, *Cattleya Dormaniana*, *Masdevallia macrura*, and some pretty, less known *Masdevallias* and *Restrepas*, *Epidendrum xanthinum*, *Ornithidium coccineum*, *Lelia anceps* *Protheroeana*, the richest of the coloured L. anceps; *Cattleyas*, large specimens of *Cypripediums* are here in bloom in this well-arranged house; and that delicately tinted *Lycaste Smeana*, as well as a new and very handsome species of *Lycaste*, with flowers of the L. macrophylla type, but with sepals shining reddish brown, petals white dotted with pink, lip white marked with rich crimson. It is proposed to call this L. Cumminii, after the custodian of the garden. The houses containing the general collection are in fine order, and brightened with the scarlet flowers of *Sophranitis*, *Calanthes*, and other showy things. J. O'B.

### DENDROBIUM CECYGYNE.

Referring to the account in the *Gardeners' Chronicle* on November 12, 1887, of the flowering of this plant, I have one which is now flowering for the second year. I should describe the sepals and petals as more of a brownish-green; the lip in my plant is

a deep black, and has the same texture as a bat's wing, and the sepals all curl upwards at the tip.

#### ORCHIDS IN THE OPEN AIR IN SCOTLAND.

On June 1 I turned out about 200 cool Orchids, *Masdevallias* and *Odontoglossums*, placing them along the edge of a burn flowing through a wooded glen; there they remained till the middle of September, getting occasionally watered when too dry. All did very well, some even flowering, and the *Masdevallia* blooms were very fine. They were then brought in to a frame, and are now making very strong growths in the *Odontoglossum*-house. I found out that in this cold climate they do not do so well when placed on or near the ground, and next year I shall place them on planks suspended between the Fir trees. *Walter T. Ogilvy, Ardshean, Dollar, N.B.*

### DISA LACERA, Sw.,

AND VAR. MULTIFIDA, N. E. Br. (N. VAR.).

The blue-flowered species of the genus *Disa* have long been a desire with the European Orchid growers, but hitherto very little success appears to have attended their importation; this year, however, some of the imported plants have flowered; one has been figured in the *Journal of Horticulture and Cottage Gardener* for September 6, 1888, p. 220, fig. 24, under the name of *Disa lacera*; of another, an illustration is given accompanying this (fig. 93), which flowered in the Botanic Garden, Trinity College, Dublin, and was noticed in this volume on p. 215; it was sent by Mr. F. W. Burbidge, as *Disa graminifolia*. A third flowered with Mr. F. G. Tautz, under the name of *D. graminifolia*; a fourth plant has just flowered at the Royal Gardens, Kew; and has been figured for the *Botanical Magazine*, and others, of which I have no knowledge, may have flowered elsewhere.

It is not easy to form an opinion as to what these four plants should be called; for if all of them were placed side by side when in flower, I think nearly every gardener would at least consider them to be four distinct varieties, for on comparing the figure here given with that in the *Journal of Horticulture*, striking differences at once become apparent. The plant which flowered at Kew is more like that here figured (which appears to me to have lost its freshness when it was drawn, as the flowers seem to have begun to close up), but has a less deeply fringed lip, and a more angular hook to the apex of the petals; that which Mr. Tautz flowered differs from all in having the lip entire, or with a slight crenation at the apex only, and a longer hook to the apex of the petals. Of the *Journal of Horticulture* plant I have seen no specimen, so will leave that out of the question; but the other three, it is quite clear, must either be considered as distinct species, or varieties of one species. I incline to the latter view, and propose to refer them to *Disa lacera*, Swartz. Mr. Bolus, however, who has also seen them, and whose knowledge of South African Orchids in a living state is unrivalled, is inclined to refer those with the fringed lip to *D. purpurascens*, Bolus, and that with the entire lip to *D. lacera*, as he considers the lip of South African Orchids as being comparatively constant in character and less variable than the petals. In this I cannot agree with him, as *D. purpurascens* has a differently shaped flower, and the apical portion of the petals is hatchet-shaped, whilst in these three it is hooked, as it is in *D. lacera*, and although the hook varies considerably in length, and the abruptness with which it is bent down, it makes no approach to the squarish or somewhat hatchet-shaped termination of the petals of *D. purpurascens*; and considering how variable the lip often is, even among South African Orchids—as, for example, in *Disa spatulata*—and as the general appearance of the plants, the size of the flowers, and the hooked petals, all accord with the plant considered by Lindley to be the *Disa lacera* of Swartz, I prefer to place them as varieties of that species.

In the original description of *D. lacera* given by Swartz, there is no mention made of the colour of

the flowers, but Thunberg describes them as whitish, which certainly does not agree with the colour of the plant now understood as *D. lacera*; but Swartz described from a specimen or specimens collected by Sparrmann, and Thunberg may either have described a different plant, or conjectured the colour from the dried specimens; it is impossible to decide which, as there is no specimen now existing of *D. lacera* in the herbaria of Swartz and Thunberg, both of which I have had the opportunity of examining. [The

petals as the character binding all these together. The following are briefly the characters:—

*D. lacera*, Swartz.—Dorsal sepal helmet-shaped, with a broadly ovate or triangular-ovate opening, sometimes apiculate at the apex, somewhat abruptly contracted behind into a conical spur  $\frac{1}{4}$ — $\frac{1}{2}$  inch long, which makes a very obtuse angle with the back of the sepal. Lateral sepals obliquely oblong, acute or sub-obtuse, concave (somewhat boat-shaped), directed forward and a little spreading. Petals with a broad oblong or elliptic oblong basal lobe or auricle, and a linear, very abruptly hooked, acute apical portion the hook varying in length and angle of deflection. Lip oblong, lacerate or fringed at the apex only, or nearly or quite entire.

Var. *multifida*, N. E. Br. (fig. 93).—Lip oblong-ovate, fringed all round from base to apex. (See small figure at left-hand corner.)

The colour in both forms is of a rather bright bluish-purple in all parts, but not of an uniform tint throughout; in the plant here figured the fringe of the lip was of a reddish-violet colour.

The true *Disa graminifolia*, I believe, has not yet flowered in this country—at least, I find no record of it; since, if it had, there can be little doubt, that it would have been figured, as from all I can learn, its brilliancy of colour far surpasses that of the other blue species, and would be sure to have been written about.

P.S.—Since writing the above I have received, through the kindness of the Editor, another flower, grown by Mr. Cummins, of Hackbridge. This flower only confirms my opinion that the plants here commented upon are quite distinct from *D. purpurascens*, which is very similar indeed to *D. graminifolia*, but flowers at a different season. Mr. Cummins' flower has a nearly entire lip, like that of the flowers received from Mr. Tautz's collection, but the petals differ from those of all the other flowers seen, in having the hooked portion much broader, somewhat rectangular, and 3—4 toothed in front. The colour of this flower also differs a little from that of the others I have seen, the dorsal sepal being bluish-purple, the lateral sepals blue, and the lip reddish-purple; the petals are bluish-purple, as in the other flowers. From what I have seen of *Disa lacera*, living and dried, I consider it to be an exceedingly variable species as to lip, petals, and colour; but at the same time it appears to me readily distinguished from *D. graminifolia* and *D. purpurascens* by the bluish-purple, more or less hooked petals, for in those two species the petals have a yellowish-green hatchet-shaped apex. *N. E. Brown, Herbarium, Kew.*

[For the sake of comparison, and also to show the adaptability of *Disa* for pot culture, we give (at fig. 94) *Disa grandiflora*, which was grown by Mr. W. Denning, Lord Londesborough's gardener at Norbiton, and figured in the *Gardeners' Chronicle* for April 3, 1875. The plant was rather more than 3 feet in height. Ed.]

FIG. 93.—*DISA LACERA* VAR. *MULTIFIDA*.

description of Swartz, however, so far as it goes, so well agrees with the plant now called *D. lacera*, that I see no reason why that name should not be maintained for it.

Until we know more about these plants I think it best not to give them a too prolific nomenclature, and am disposed to group all the forms of *D. lacera* that I have seen, living and dried, in the following manner:—I would call all those specimens which have lip entire, or crenate, or fringed at the apex only, *Disa lacera*; and all those that have the lip more or less deeply fringed all round I propose to call *Disa lacera* var. *multifida*, regarding the hooked

### BEDDING VIOLAS, OLD AND NEW.

It is many years, probably, since bedding Violas generally have been so well suited as during the now past cold, sunless, rainy summer of 1888. If many things in the garden have signally failed, these, on the other hand, have been equally successful in producing their bright pleasing flowers in greater profusion than ever. If I rightly remember, it was a more than usually wet summer in 1879, and Violas did splendidly that year—at least, with me in Cheshire. But saying this I do not wish it to be understood that these charming bedding plants do well only in wet seasons—far from it; I merely mention it as a fact that they do better than in exceptionally dry seasons. What these Violas really delight in is warm, showery weather, and when th's is not forthcoming, copious waterings should be given them late in the evening. In northern districts this is hardly needed, but in southern counties, to ensure their doing well in all sorts of weather, special treatment must be given them.

As one much interested in this truly beautiful group of plants, I may be permitted to briefly detail my practice, which I doubt not, if followed, would prove helpful to growers, or would-be growers,

are required to be at their best, will, to a great extent, regulate that of the planting; but assuming that they are required—as they are in most cases—for early spring and summer display, then there is no

month of October, will well need reminding of the superiority of the system. Many people plant from divided stock, but these always lack the vigour and energy of strong, newly-rooted stock. Provided cuttings of the right sort have been selected, *i.e.*, those from near the base of the plants, and which have flowered but little, plants of the right kind will be forthcoming also as a natural consequence. These inserted at the time stated will be in fine condition for planting out during the month of October. It is such as these that, if cared for after planting, will be found bristling with underground shoots before the end of the year—the best possible promise of a rich bloom in the future. Even the newly rooted plants will exhibit this tendency to break freely from the base, and from this fact I glean that they should be buried just below the surface, as they are too young and tender at this time to endure continuous change; in fact, they are benefited by being earthed up as the young shoots are made, with refuse from the rubbish fires, road scrapings, leaf-soil, or well-decayed manure. This method is of real value in low-lying foggy places, where damp and a raw cold atmosphere are frequent in winter time, as they suffer more from continued damp and cold than from actual hard frost in drier districts.

Few plants enjoy a richer soil more than *Violas*; and in planting them I use cow manure wet from the sheds; in this state it is of great value when the summer comes in, keeping the ground moist and cool about their roots, which by that time will have got down to it. Those, therefore, who would grow *Violas* to perfection should manure freely, especially when the soil is gravelly, and consequently dry. I do not believe that gardeners generally are aware of the many and various purposes to which *Violas* may with advantage be put, otherwise they would be grown by thousands where only scores are at present grown. Take, for example, some of our London parks and public gardens, and here you will find a vast number of either empty beds or at least bare surfaces in that portion occupied by bulbs, with no other chance but that this monotony must prevail till the bulbs push through the soil three months hence. How much more natural and pleasing the effect if, meanwhile, such beds as these, after the *Tulips*, &c., are planted, were carpeted with such things as *Violas* or even *Myosotis dissitiflora*, or some such simple plant; *Limnantes Douglasii*, again, would here and there make a change if necessary, though among *Violas* there is an almost endless variety of form and colouring. A natural carpet such as this would make a very pleasing and desirable change, and the effect would be enhanced by studiously avoiding a yellow *Tulip* and a yellow *Viola* appearing on the same bed, or in short any two of like colour. The *Violas* may readily be planted after the bulbs, and thus, instead of a bare surface to gaze upon, the public would have something to relieve the monotony for the moment, and which would burst into bloom in the earliest days of spring.

This plan need not be monopolised by public gardens, for it is quite as desirable in any garden, and I doubt if anyone will gainsay its usefulness and effectiveness. Again, take a bed of standard or dwarf *Roses*, and what more delightful companions have we than these *Violas*?—the latter crowded with endless buds and flowers, while the *Roses* are only bursting as it were into new life. Is it impossible for those who have the management of these large public gardens, to make an attempt at what I describe? or are they content to continue their round of carpet designs year by year, which entails a great amount of labour annually, while little if any change or improvement is noticeable? Slowly, but still surely, the bedding *Viola* is becoming more popular, and it only means a little waiting to see these useful flowers in much more general use than now, and their hardiness and free-flowering properties cannot but assist in popularising them. The great improvements of late years among these has brought us many fine varieties, a brief notation of which, as well as of some of the older,

FIG. 94.—*DISA GRANDIFLORA*: FLOWERS CRIMSON AND PINK. (SEE P. 664.)

of these plants, particularly in the South. By many, the most important fact in regard to their culture is lost sight of, and that is the right time for planting. Many people imagine—and rightly, too, so far as it goes—that *Violas* will transplant readily for several months in the year. Quite so, but only with a certain amount of success. Of course the season they

time for planting them to guarantee these results like early autumn. Any one who requires *Violas* to make an early display should plant early in October, from cuttings taken in the end of July, or early in August. These are the right stamp for producing the best effect. Those of your readers who have planted largely from summer-struck plants during the

though equally good forms, may serve to exhibit their diversity of colour.

*New Varieties*.—Sir Joseph Terry, rich black-violet self; a very free and continuous bloomer; Ethel Baxter, bright rosy-pence, with darker veins, the upper petals shaded lilac, also an excellent variety; Mrs. Baxter, rich rosy-purple, shaded with lilac and lavender; a fine bedder; Merchiston Castle, rich crimson, shaded with violet, and margined with white—a most distinct shade; Spotted Gem, a rosy-purple flower, flushed with white—very free and distinct.

The following are among the best of the older varieties:—Whites: Countess of Hopetoun, Jaffray-anum, Pilrig Park, Champion, and Mrs. Smith, the first being decidedly the best white *Viola* yet raised. Yellows: Ardwell Gem, Bullion, Golden Prince Improved, and Golden Queen of Spring. Lavender or mauve shades: elegans and Duchess of Albany are the best. Then we have excellent kinds in Bronze Queen, True Blue, Cliveden Purple compacta, Queen of Lilacs, and Queen of Purples, all of which enjoy descriptive names and are first-rate bedders. Archic Grant is a bold, handsome kind, with rich, violet, purple-blue flowers; while Countess of Kintore, a most popular market variety, has purple, slate-blue and white flowers, an excellent bedder in every respect. There are many other good kinds, but the above will be ample to select from, while those who select from them may have the satisfaction that they are all excellent bedders, free bloomers, and possessed of sound, vigorous constitution. *Viola*.

## HARDY FLORISTS' FLOWERS.

### THE AURICULA.

DECEMBER is the resting period for these plants, but whether it is so will greatly depend upon the weather. It was cold enough in October, but from the middle to the end of November the weather has been exceptionally mild, and the appearance of the plants is more like spring than November. I like my plants to put on their best dress in April, not in November and December. No plant known to me likes less to be excited at unseasonable times; and they seldom afford first-class trusses of bloom in April unless they have a season of perfect rest in December and January, and this resting period can only be obtained if the weather be cold. All we can do at present is to remove the lights from the frames entirely when possible, admitting air freely when the lights cannot be removed. It is favourable weather for seedlings and small offsets; these are looking very well, and none of them have died off from damp. I am of course careful to remove all dead and decaying leaves, alike from the old and the young plants. I have so often urged the importance of destroying all the aphid tribe, that nothing further need be said on that head. Of one thing I am more and more convinced as the years go on, that grave errors are committed by standing the pots on, or plunging them in, ashes or cocoa-fibre refuse. I have only just heard of an amateur who has lost some of his plants, and had others injured, by merely standing the pots containing the plants on ashes which must have contained deleterious substances. Some years ago I placed a frame full of plants on cocoa fibre refuse, and about an equal number on trellis-work in the frame, the trellis being of wood—the plants did best on the wooden trellis. Mr. Horner grows his best plants on a wooden trellis all the year round; so also does Mr. Simonite, of Sheffield. All our plants have this year been grown in a similar manner. I merely mention this as one of the details of the work, worth the notice of amateurs. It may be a small matter, but attention to the smallest details of our work brings success in the long run. Out-of-doors, plants look remarkably well, and, in my own case, have for some time been almost smothered with decayed leaves blown into them from Lime and other trees near. As long as the leaves are dry there would be

no danger of the plants being injured, but if a long-continued period of rainy weather set in, decay of the main stems may be engendered, and the plants might die. It is better, therefore, to clear off all these leaves together with the decaying leaves of the plants and leave the latter without this protection. Pot plants should not be allowed to suffer from excessive drought, although quite the minimum of water is required in December and January.

### CARNATIONS AND PICOTÉES.

At p. 446 of the present volume I made some comments upon taking off the layers for potting or planting-out. At that time many growers were complaining about the layers being badly rooted and the weather being very cold; the prospect of getting the plants well established before the winter was not very promising, but November has been much better than October for the plants, and if they have been well cared for they will now be in a good condition to pass through the winter. All my pot plants are well established, and at present they look very promising. The whole collection has been thoroughly cleaned, and the surface soil stirred up, removing weeds, and killing any insects found on the leaves. Where the plants are well established, the lights are removed entirely from the frames to allow the air to play freely around them. I have a number not so well established, and these have been placed in a small frame by themselves where they can be kept closer; the plants always keep more plump, and produce roots more freely in a close frame.

Out-of-doors plants are looking very well, the seedlings better than one could expect, after the way they were deluged with rain, in some cases being under water for two days, about August 1. The ground became excessively hard afterwards, but since it has been stirred up the plants have become well established, and are now quite vigorous, although of small size.

### TREE OR PERPETUAL FLOWERING CARNATIONS.

These plants require a night temperature of 55°, less or more, to develop the flowers perfectly. The plants are not so strong this season as usual, and the best is the yellow fringed variety, Andalusia. This has always flowered freely with me at this time of the year. Besides the perpetual flowering varieties we potted up a number of plants of the ordinary kind of Carnations, and included a few of the ordinary Picotées. These were plants that spindled for bloom soon after layering. We have been able to cut blooms out-of-doors during the last week in November in sheltered places, so mild has been the weather. I saw in Messrs. Paul's nursery at Cheshunt some very dwarf varieties flowering most freely; they had been dug up from the open ground and potted some time in October. The plants were about 1 foot high and a mass of bloom. The best of them were Albertine Carle, blush; Alegatiere, scarlet; Jean Sisley, buff, scarlet stripes; Madame Carle, pure white. *J. Douglas*.

## TREES AND SHRUBS.

### NOTES FROM COOMBE WOOD.

DAPHNE MEZEZEON AUTUMNALIS.—A fortnight ago, on a visit to the Coombe Wood nurseries of Messrs. Veitch, we noticed a number of plants of this handsome Mezezeon in full bloom. Scarcely a fully expanded flower was to be found on any of the plants of the typical species, and in addition to its precocity in the matter of flowering, the individual blossoms were decidedly larger, and of a deeper shade of colour, than those of the old-fashioned but deservedly popular *Daphne Mezezeon*. We were informed that the variety whose name figures at the beginning of this note had already been in flower a week or two previous to our visit. Does any reader of these columns know the history and origin of this fine variety? If so, he would doubtless confer a favour on many readers by publishing the facts,

### LIGUSTRUM MASSALONGIANUM.

In vol. xvi, p. 149, of the *Gardeners' Chronicle* is given a figure of this handsome Privet, which we recently saw flowering freely in pots. Although not as hardy as many of the Privets, it is a plant well worth growing for the beauty of its compact panicles of white flowers with reddish-brown anthers. Its floriferousness, compact habit, and the peculiar aspect of its long narrow leaves, make it a very desirable plant for corridor or cool conservatory decoration. It is a native of the Khasia Hills.

### HYMENANTHERA CRASSIFOLIA.

One of the most remarkable of hardy shrubs now to be seen in the nursery is the plant figured in the *Gardeners' Chronicle* for 1875, vol. iii, p. 237. Messrs. Veitch's finest specimen is a dense bush, nearly 5 feet high, and as much through, laden with small white berries. It is a native of New Zealand, and is remarkable as being the only member of the *Violet* family (of a shrubby nature) which is hardy in the climate of Britain.

### CYDONIA JAPONICA MOERLOOSEI.

Among the numerous forms of the old Japan Quince this is perhaps the most continuous flowerer. At any rate it is the only one in the nursery which exhibited quite a profusion of scarlet flowers. It is said to be almost always in flower, and the effect it produced on a dull November day can be readily imagined. Evidently there are two plants—quite distinct from each other—cultivated under the name given at the head of this note in different nurseries; for on consulting the descriptive catalogue of one of the principal German establishments, *Cydonia japonica* Moerloosei, we found, was credited with having white flowers washed with carmine. Whatever may be the right name of the Coombe Wood plant, it is a good thing.

### MAGNOLIA GRANDIFLORA.

Without a doubt this is truly a very fine shrub, and its white, sweet-scented, cup-shaped, very fragrant flowers of large size never fail to elicit admiration, whether viewed on the plant, or when cut. Unfortunately as cut flowers they are of short duration. In a fair-sized room two flowers are sufficient to scent it, and any more would be less pleasant. The blooms are not very much inferior to those of the *Victoria Regia*, to which, at first sight, they bear a considerable resemblance. It is somewhat strange that although the plant has been in this country for over 150 years, yet fine specimens are rather the exception than the rule in gardens—a fact which may be due to its being too tender to do well in the colder and rougher parts of the kingdom. At all events, as a flowering shrub, or half tree in the open, but with the protection of a wall, in a warm position, it will grow vigorously and flower freely, attaining large dimensions. Good examples of the plant on a wall may be seen in the Earl of Ashburnham's gardens at Ashburnham Place, Battle, Sussex, where, amongst others, two large plants of the Exmouth variety have been in splendid flower this past season. The plants cover a great expanse of a wall, which is about 20 feet high, and not a few of the blooms were nearly a foot across. Mr. Holmes, the gardener, informed me that these specimens were more or less in flower for the greater part of the year, and that the variety is much superior to the ordinary form of *M. grandiflora* in the quantity and quality of its flowers. *F. Ross*.

## PLANTS AND THEIR CULTURE.

ASPIDISTRA LURIDA.—There are few plants can so well withstand the adverse conditions to which they are exposed in house decoration, but it is of much importance that the leaves be kept free from dust by frequently sponging them. Notwithstanding its enduring qualities it is desirable to occasionally renew a portion of the stock; and this, owing to the comparatively slow rate at which it can be propagated, is possibly a great drawback. Seeds

may sometimes be obtained, but the general practice is to cut up the creeping rootstock into small pieces with one leaf or more attached. These pieces should then be either potted singly into pots slightly larger than the pieces, then sinking the pots in plunging material over a gentle bottom-heat, or the pieces may be planted thickly in the plunging material, if this be leaf-soil, and potted up afterwards; but by potting at once they become sooner established. A moderately moist atmosphere at about 60°, will accelerate rooting, but they may also be successfully grown on in an ordinary greenhouse, taking care, however, not to break them up into very small pieces, as latent buds do not start so readily under cool treatment as under warm. Moreover, in warmth, finer and larger leaves are developed, especially in the case of the variegated variety, which is by far the more prized. They delight in a rich loamy compost, well-drained pots, and a good exposure to light, with copious syringings. While the plants are small and not yet established the leaves should be held upright with sticks to prevent the pieces being moved.

**Tuberose.**—The fragrant blossoms of the *Tuberose* are usually much appreciated, and they are alike useful for bouquets of all kinds, button-holes, and sprays. To keep up a steady supply nearly all that is necessary is to put in, or rather start successional lots of bulbs at intervals. There is now, owing to the early arrival of African bulbs, not much difficulty in maintaining an unbroken supply, as by the time the last of the American are out of bloom Africans are ready to take their places. Sometimes disappointment is experienced when roots miss to flower, and in some cases this arises from the bulbs not being properly ripened; but I have known cases where the failure was attributable to mismanagement. A common cause of loss to flower is by attempting to force them into flower before the bulbs have had time to make roots; and when this happens, even if flowers are produced, they are not of the fine quality obtained from well-rooted plants, therefore see that root-growth is well in advance of the top. In potting, a convenient plan is to place three bulbs in a 32-pot; this size being sufficiently large to grow them well, and as they grow tall, and require staking, one stick inserted in the centre of the pot is sufficient for the three flower-stems. If grown singly, pots of a size smaller may be used. A strong, rich, loamy soil suits them, and after being potted, plunge them in a mild bottom-heat, but avoid watering much until the roots appear freely round the ball; indeed, if the soil be properly moist at the time of potting watering will rarely be needed until the bulbs are rooted, after which they may be pushed on in a moist stove. By potting up a quantity at one time, a long succession of bloom can be maintained by plunging them where only an intermediate temperature, or under 60°, is kept, there they will come on slowly, and may be hastened by introducing them as required into the forcing-house. There are several varieties, and although all are good, the Pearl, on account of its dwarf habit, is often preferred to any other. After flowering, if they are to be kept for another year, plenty of heat, light, and water, until their leaves begin to show signs of ripening off, when drier and arier conditions should be maintained. But imported bulbs are now so cheap that it is scarcely worth while to keep old ones.

**Fuchsias.**—Late struck cuttings should be potted on as they require it, for if allowed to get into a stunted condition, it is difficult to start them freely afterwards. A loamy compost, with a good proportion of leaf-mould, or decomposed manure, and rough sand to make it porous, will grow Fuchsias well. After potting they are much assisted by a few degrees more warmth for a fortnight, with a moist atmosphere, as this enables the roots to lay hold of the new soil readily; but as soon as they begin to grow, the less fire-heat there is employed the better, and where greenhouse pits are found, no better position need be desired for them. Being placed on shelves near the glass in a greenhouse answers well, and while the plants are in pots not exceeding small 60's, it is a convenient practice to place them in shallow boxes before standing them on the shelves. The pots are then not so liable to be knocked off the shelf, nor are the plants so much trouble to keep moist. *F. Ross, Bletchingley.*

## THE FLOWER GARDEN.

**GENERAL WORK.**—See that all is neat and orderly in the flower garden and pleasure grounds, not neglecting the more distant parts of the grounds. Clumps and shrubberies should receive timely attention, staking and tying any branches that may have become misplaced by wind, shortening back straggling shoots, but not carrying out a general pruning of evergreens or deciduous shrubs for the present, that operation being better deferred to a later season. Rake and clean the ground under shrubs, and lightly point over the surface with a fork. The present time is opportune for repairing drives and walks, and any defective drains should be put in order, and catchpits cleaned out. Gravel walks which have long been laid should be turned, and re-surfaced with a layer of fresh gravel, and the latter, if of a rough character, should be passed through a half-inch screen or sieve before using. The walks should be 2 or 3 inches higher in the centre than at the sides, and must be well rolled at frequent intervals. In the case of shrubs, border plants, hardy perennials, and bulbs of doubtful hardiness, it will be advisable to have means at hand for protecting such, for notwithstanding the mildness of the season, a change to severe weather may occur without much premonitory warning. As a material for the purpose, Spruce Fir branches, when used sparingly, are very good. For Hyacinths, Tulips, and similar subjects I do not know of anything to equal coarsely-sifted leaf-mould, coal-ashes, or cocoa-nut fibre refuse, a 2 or 3-inch layer of which will ward off many degrees of frost. This may also be used for protecting the crowns of tender species of herbaceous plants. Put handlights over *Helleboros niger* if clear and well-developed flowers are required for decorative purposes, not forgetting, however, to afford ample ventilation by tilting up the tops of the lights in the day-time.

**Frame Ground.**—Frames containing half-hardy perennials as well as young stock should be ventilated daily, taking off the lights entirely in the day time in fine weather; keep the plants free from decaying leaves, and the surface soil from moss, paying due attention to the covering up of the frames at nights. *J. Horsfield, Heytesbury.*

## FRUITS UNDER GLASS.

**VINES.**—If the buds on the early Vines are on the move the temperature may be advanced to 55° on cold nights, and to 60° on mild ones; and the latter figure should not be exceeded until such time as the Vines approach the flowering stage. Whenever the leaves begin to unfold discontinue syringing the Vines, and let the atmospheric moisture be wholly supplied by sprinkling the paths and borders, and by turning over a portion of the fermenting material every morning. Guard against spilling water on the hot pipes, this proceeding raising a cloud of steam, which is highly prejudicial to the young foliage of the Vine.

**Pot Vines** which were recommended to be started on a bed of fermenting leaves will require slight additions to be made from time to time to the materials of the bed, so that the heat may be maintained. This should not, however, exceed 85°. When the leaves unfold discontinue syringing, as in the case of planted out Vines, and supply the necessary humidity as above advised. Tie the rods to their supports in time, and where two shoots spring from one joint rub off the weaker; stop the shoots at the second or third leaf beyond the bunch, and remove all the bunches excepting the best six as soon as their size can be distinguished. When the foliage is fairly developed assistance with weak manure-water may safely be afforded the plants, and as soon as the roots are discernible through the surface-soil an inch in depth of rich loam, horse droppings, bone-meal, or Thomson's manure, should be placed over them, and when this has got washed in by watering another similar dressing may be given, and repeated when it should appear needful. If Vines which are confined in a 12-inch pot suffer from scarcity of water, or insufficient root food, the produce will not be worth much. Advance the temperature to 60° when the buds have burst, and when the leaves are fully developed raise the night temperature to 65°—10° higher by day if cloudy, and 5° higher than that with sunheat. Vines started this month require a treatment precisely similar to those started last month.

Grapes hanging on any Vines will require to be frequently examined, and all decaying and mouldy berries cut out, as these soon communicate decay to the sound ones; the night temperature in such houses may be kept at about 45°—not higher, and when the weather permits of it being done plentiful ventilation should be afforded, but in wet and foggy weather the ventilators must be kept shut. Look over the bunches in the Grape-room once a week, and keep up a steady temperature of 45°.

Prune and cleanse late vineries, removing the top-dressing of soil down to the roots, and re-surface with sound loam, lime rubbish broken small, and Thomson's Vine manure, afterwards giving a copious watering with tepid water. Secure the requisite quantity of shoots for making Vine eyes, and lay them in soil for the present. The shoots selected should be of medium strength, and well ripened. *W. M. Baillie, Luton Hoo.*

## THE HARDY FRUIT GARDEN.

**PRUNING.**—The leaves now being off the trees, pruning may be commenced, and where a large number of fruit trees is grown advantage should be taken of the open weather to push on with it. Apple, Pear, and Plum trees in the open quarters should first receive attention, the prunings and leaves raked up, and the borders made tidy. If these trees received proper attention during the summer, but little will remain to be done beyond shortening back and spur-ring in any young growths that were then overlooked; but where the pruning was not done at that season it must be seen to now. All trees which have filled their allotted space should have the young wood spurred-in to two or four buds, according to the variety. For medium and weakly growers spur-in to two buds, and the stronger growers to four buds. It frequently happens that when the trees have become fully established they are found to be crowded with branches, and in consequence sunlight is excluded from the inner parts of the tree, and the quality of the crop much impaired. In such a case some of the worst placed and oldest branches should be sawn clean out, taking care to pare the surface of the wounds with a knife or chisel. Attend to the training of young growing trees, thinning and regulating the branches. For the purpose of training, stakes about 3 feet in length should be provided, and these to the number of six or seven should be driven in the ground at regular intervals round the tree, and by means of strong twine the branches can then be placed in any desired position. After one or two years the ties can be removed, as the branches will then have become set in the wished-for form. If it is desired to propagate any particular variety, the scions should be selected and cut off before the tree is pruned, labelled and laid in a shady place.

Pears and Plums on walls should next be taken in hand and with these—young trees excepted—the principal part of the pruning will consist of merely spur-ring in the young wood to two or three buds, and leaving a sufficient number of young shoots to fill up gaps caused by loss of branches. Unless well looked after, old trees are in course of time apt to become crowded with spurs, and as a natural consequence the produce is inferior. These spurs should be reduced in number and length; and when the work is finished they should stand at 4 or 5 inches apart on the branches. With young trees the wood that has been laid in during the summer will require to be regulated and thinned, bearing in mind that only sufficient should be retained for forming the main branches, the number depending on the style of training adopted. When a certain number of the trees have been pruned, the nailing of such should be began. Examine old shreds and make good deficiencies; but in nailing use no more shreds than are necessary to make the trees secure, and see that they are not fastened too tightly round the branches. For fastening the main branches tarred twine is preferable to wide shreds.

**The Fruit-room.**—Remove all specked and decaying fruit, and as regards Pears do not trouble about filling up the gaps caused by the removal of decayed fruit, for the less they are handled and moved about the better. Allow a free circulation of air to pass through the room by keeping the ventilators open on all favourable occasions. Endeavour to use up all the earlier varieties of Apples and Pears for present consumption, reserving the late keeping varieties for future use. *A. Ward, Stoke Edith Park.*

Advertisers are specially requested to note, that, under no circumstances whatever, can any particular position in the paper be guaranteed for advertisements occupying less space than an entire column.

#### SUBSCRIBERS TO

**THE GARDENERS' CHRONICLE** who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

Liliun auratum, Dutch Bulbs, Roses, &c., at Small's Rooms.

SOME three years since Mr. N. E. BROWN published in our columns a notice on the terrestrial Orchids of the Cape of Good Hope (see *Gard. Chron.*, August 22, 1885), which excited some attention among orchidists. Mr. Brown's article was avowedly based, to a considerable extent, upon the notes of Mr. HARRY BOLUS—a hard-working and eminent botanist resident at Cape Town, and specially conversant with the most interesting flora of that peninsula. Since the time to which we refer Mr. Bolus has contributed various articles to the Linnean Society, and now we have before us a very valuable work on the *Orchids of the Cape Peninsula*, and which is described as an offprint from the *Transactions of the South African Philosophical Society*. The work in question is modestly denominated an attempt to describe "the Orchids growing on the peninsula of the Cape of Good Hope, to give their names and synonyms, to arrange them as far as possible in groups, to adduce the stations where they have been found, and their further distribution so far as known." To this is added a list of collectors, and of books and papers already published upon the subject of South African Orchidology.

The Cape peninsula is as remarkable for the singularity as for the beauty of its flora. The Cape Heaths, the Proteads, are known and appreciated among horticulturists, while they are botanically interesting in that they are for the most part peculiar to the Cape, and not found

elsewhere. In the corresponding corner of the Australian continent, however, occurs a flora equally characterised by singularity and beauty. Proteads and Restios abound as at the Cape, but while the larger groups or genera are the same the species are all different, while the place that the Heaths occupy at the Cape is filled by the nearly allied yet quite distinct Epaorids of Australia. We cannot pursue the subject further now, but we have probably said enough to indicate one of the reasons why the Cape flora is so interesting. Botanists belong to that group of inquisitive people who want to "know the reason why," and, of course, the near relationship, coupled with the absolute distinctness of the two floras above-mentioned, offers a problem of no little interest, the solution of which is probably to be found in the original land-connection of the two countries now so widely separated. If this were so the original flora was probably different from both those now existing, and divergences have taken place subsequently. The collection and investigation of evidence in support or refutation of these hypotheses necessarily adds largely to our knowledge, and on this account may appease the hunger for facts of those people who complacently prefer an ounce of fact to a ton of theory, ignoring the truth that reasonable speculations are eminently serviceable in bringing to light facts which, but for their assistance, would remain latent. Turning, however, to Mr. BOLUS' book we find the Cape peninsula described as—

"A tract of land about 40 miles long, varying in width from about 3 to 11 miles, and connected with the continent by a broad and low sandy isthmus, 11 miles wide. In area it is rather larger than the Isle of Wight. A great part of its surface is occupied by a central mountain range, running north and south from Table Mountain, which attains an elevation of 3562 feet, to the southern extremity at Cape Point. . . . The exposed rocks are, for the most part, sandstone on the mountains, with patches of the underlying clay slate, and also granite; on the low ground are sandy downs of considerable extent. The climate is temperate, the mean annual temperature 61° F. Frosts on the low ground are rare, and even on the mountain-tops snow is an unusual occurrence, and never lies for more than a few hours. The annual average rainfall varies in different localities from 23 to about 60 inches, and two-thirds of it falls during the winter months of May, June, July, and August, the warmth of the summer months being tempered by the prevalent southerly winds of that season. In many respects the climate resembles that of the Riviera.

"The steep ravines of the mountains are filled with indigenous shrubs or trees, while their sides are in many places dotted with the Silver Tree (*Leucadendron argenteum*); at their feet are scattered bushes or copses of imported Pines and Oak, all else, including the sandy downs of the isthmus, is covered with a Heath-like growth of small dull-coloured shrublets, from 1 to 3 feet in height, yet not closely, but interspersed with a great variety of herbs, Restiacea grasses and bulbous plants. Stretches of grasses or grass-like plants, occur in a few places, where the bushes by continued burning and grazing have been eradicated, but are not common; surface water, except for a few months of the rainy season, is deficient, and aquatic plants, though not absolutely wanting, are not abundant in species or individuals."

We cite the foregoing paragraph as supplying cultivators with some details which may be of value to them. Mr. BOLUS pursues his subject by giving special details with reference to the number and distribution of Orchids in the peninsula, and the resemblances or differences to be discovered between the Cape Orchids and those of Chili and South-west Australia. The total,

like the proportional number of Orchids in this corner of South-west Africa, is very large and only surpassed by that of some parts of Australia.

Most of the 102 species are confined to the mountains or to the flats, as the low sandy downs of the isthmus are termed. The majority of the species flower in early spring and summer.

An interesting appendix to this portion of the introduction consists in a list of the chief collectors on the Cape peninsula, with brief biographical details. This is followed by a corresponding list of botanical writers who have treated of Cape Orchids. The bulk of the volume comprises a detailed systematic account of the ten genera and 102 species, founded upon actual comparative investigation of the living plants, and therefore most valuable to the student, for whose convenience also analytical keys are added.

Of *Satyrium* eighteen species are enumerated, while it may surprise some Orchid lovers to hear that *Disa* comprises no fewer than forty-six species, natives of this particular region. Of these the best known and the most beautiful is the species here called, in compliance with the law of priority, *D. uniflora*, but which is better known in gardens as *D. grandiflora* (fig. 94). This plant grows along the margins of streams (which frequently become dry in summer), on Table Mountain, at an elevation of from 1100 to 3300 feet, flowering from January to March. As this plant is such a universal favourite the following particulars, given by Mr. BOLUS, may be of interest:—

"This beautiful flower is the object of universal admiration, and the name which has been given to it—The Pride of Table Mountain—indicates the honour in which it held. It is, indeed, the queen of terrestrial Orchids in the Southern Hemisphere, as *Cypripedium spectabile* may be said to reign, though with less magnificence, in the Northern. The first mention hitherto discovered of this plant is in the *Historia Plantarum* of our old English botanist, JOHN RAY, in the third volume of which, published in 1704, p. 586, it is enumerated as '*Orchis africana flore singulari herbacæ*, D. OLDENLAND, Mus. Pet. 280', and, after a brief description, RAY adds that he received a dried specimen from D. PETTIVER, amongst other rare plants sent by D. OLDENLAND. This, however, was before the time of LINNÆUS. The first botanist to describe and publish it under the Linnean binomial system as *Disa uniflora* was BERGIIUS in 1767.

"LINNÆUS the younger, with the laxer notions which prevailed in his day in regard to the law of priority of nomenclature, thinking that BERGIIUS' name was inappropriate (since the plant has usually more than one flower) changed the name to *Disa grandiflora*. By the latter name the species has been so long and widely known, that to revert to the older one will cause inconvenience for a time. But BERGIIUS not merely established the species; he also founded the genus upon this species, which has always been recognised; and, besides, gave an adequate figure, which left no sufficient reason for disregarding his name. Botanists are bound to admit such a claim, even at the cost of inconvenience.

"The earliest record of the flowering of this plant in Europe appears to have been in the *Botanical Register* for 1825, when it was figured from life. It is still abundant on Table Mountain, although of late years large quantities of the tubers have been annually exported to Europe, and much needless destruction arising from wasteful gathering by unskilled hands resulted; but the summit of the mountains being Crown land, the Government has recently intervened and restricted the removal of tubers within reasonable limits; so that, if the supervision be continued, there will be little reason to fear the extinction of this truly noble species."

Among other species of *Disa* are *D. megaceras*, the macrantha of gardens; the rose-coloured

*Disa racemosa*, figured in the *Gardeners' Chronicle*, 1888, fig. 81, p. 592; and various blue-flowered species, which form the subject of a note by Mr. N. E. BROWN.

Our notice of this book has extended to such a length, that we cannot add any further particulars concerning it, except to say that the author has carefully consulted the requirements of students by supplying an index, and, best of all, by supplying a series of thirty-six partially coloured lithographic illustrations, in which the botanical details are so clearly given, and in so workmanlike a way, as to give every confidence in their accuracy. As this book is likely to be in demand among Orchid lovers, we regret to note the omission of any publisher's name.

**NEPENTHES RUFESCENS**  $\times$  (*hyb. nov., in hort. VERRUC effecta*; fig. 85).—This is stated to be a cross between *N. Courtii*  $\times$  out of *N. zeylanica rubra*. *N. Courtii* itself is a cross between an unnamed Bornean species and *N. Dominiana*  $\times$ , this latter being also a cross between *N. Rafflesiana* and the same undetermined Bornean species; so that our present plant is very much crossed, and combines the blood, if one may so say, of three species and of two hybrids. The stem is cylindric, reddish in colour, closely covered with decurrent, broad, sheathing leaf-stalks, ciliate at the margins, and each about 1 inch long. The leaves measure about 12 inches in length by  $2\frac{1}{2}$  inches in breadth; at the base they taper gradually towards the stalk, while at the apex they are rather acute. Two ribs run through the leaf parallel to the margin, and at a slight distance from it. The midrib is red. The pitcher itself is cylindric, green, flushed with red,  $7\frac{1}{2}$  inches long, by 2 in width; the mouth  $1\frac{1}{2}$  inch across, surrounded by a reflexed regularly ribbed rim; the lid, 2 inches long by  $1\frac{1}{2}$  inch wide, is oblong and spurred. The wings are  $\frac{1}{4}$  inch deep, fringed. The plant was raised in Messrs. VERRUC's nursery at Chelsea, and is an interesting addition to the genus.

**ROYAL HORTICULTURAL SOCIETY.**—It is anticipated that there will be at least six vacancies on the Council to be filled at the annual general meeting in February next. We understand that the following gentlemen have signified their wish to be relieved of the work which during the present year has been very heavy, viz., Mr. Thiselton Dyer, Professor Michael Foster, Dr. Hogg, Sir Edmund Loder, Mr. Harry Veitch, and Mr. G. F. Wilson.

**NATIONAL AURICULA AND PRIMULA SOCIETY (SOUTHERN SECTION), AND NATIONAL CARNATION AND PICOTEE SOCIETY (SOUTHERN SECTION).**—Mr. J. DOUGLAS informs us that a committee meeting of the above societies will be held at the Horticultural Club, Hotel Windsor, Victoria Street, Westminster, at 4 P.M. on Tuesday, December 11, to make final arrangements for the exhibitions. Members are urgently invited to attend.

**GARDENERS' ORPHAN FUND.**—We are informed by Mr. BARROW that he has received £31 from Mr. O. THOMAS, Chatsworth, as the result of the floral concert, held at Chesterfield, on November 14, in aid of the Fund. This result must be extremely satisfactory to the promoters and all concerned.—The usual monthly meeting of the committee took place at the Caledonian Hotel, Adelphi, W.C., on Friday, the 30th ult., Mr. George Deal presiding, there being, as usual, a good attendance, including Mr. George Bishop, Local Secretary for the Teddington district. The minutes of the last meeting having been read, the Chairman reported that the sub-committee appointed to open negotiations with the City Companies with a view of obtaining support from their funds, has commenced work, but nothing definite had at present transpired. The balance at the bank in favour of the Fund was announced to be £254 7s. 3d. Mr. W. Bates handed in the sum of £2, obtained

FIG. 95.—NEPENTHES RUFESCENS: COLOUR OF PITCHER GREEN, FLUSHED WITH RED.

through a collecting box at the recent exhibition of Chrysanthemums at Twickenham; Mr. G. Bishop the sum of £3 6s, similarly collected at the Teddington Chrysanthemum show; Mr. G. W. Cummins the sum of 14s. 9d. from the collecting box at The Grange Gardens, Wallington, and 6s. 7d. obtained at the local Chrysanthemum show; Mr. Garnett, St. John's Gardens, Wakefield, the sum of £3, as a donation from the funds of the Yorkshire Association of Horticulturists; Mr. R. Scott, Moorfields, Manningham, the sum of £1 10s. 6d., the proceeds of a box at the exhibition of the Bradford Chrysanthemum Society; Mr. Wooderson, Bexley Heath, the sum of 1 guinea, from the Chrysanthemum Committee of Bexley; and Mr. H. J. Clayton, The Gardens, Grimston Park, Tadcaster, wrote stating that the committee of the York Floral Gala had voted the sum of £5 to the Orphan Fund. It was thought that if the gardening Press would give publicity to contributions of this nature, others might be induced to exert themselves in the same direction. A letter was read from Mr. Owen Thomas, The Gardens, Chatsworth, stating, in reference to the recent entertainment proposed in aid of the Fund by the gardeners of the Chesterfield district, that it proved a great success, 700 to 800 persons having been present, and the decorations made with autumn foliage and berries were unique, and greatly appreciated by the company. Mr. Drummond, nurseryman, Stirling, local secretary for that district, wrote expressing his regret that his efforts to obtain subscriptions from gardeners in Scotland had met with so little success, they appearing to think that the Institution is essentially an English one, and not intended for the Scotch. The committee regretted that this prejudice existed, but desired it to be widely known they were desirous of receiving applications from the friends of necessitous orphan children from every part of Great Britain and Ireland. Another gross of collecting boxes was ordered at a cost of £8 10s., the Secretary reporting that the sum of £15 18s. had been obtained through this means. A hearty vote of thanks was passed to Messrs. Bates, Bishop, Cummins, Garnett, and Scott for the contributions received through their agency. The proposal to hold another Covent Garden *fête* on behalf of the Fund was mentioned, but deferred for further consideration. A cordial vote of thanks to the chairman concluded the proceedings. The letter read from Mr. Drummond, seedsman, of Stirling, referring to the difficulty he has experienced in obtaining contributions to the fund from Scotch gardeners, owing to the prejudice which exists against the fund on account of its being considered an essentially English institution, conveys an impression that is altogether incorrect. It will be remembered that the committee announced in all the leading gardening papers their intention to elect six children upon the Fund, and applications were invited in the most open manner. We are greatly mistaken if it is not the earnest desire of the committee to make their Fund a blessing in all parts of the United Kingdom, however remote. An application from the northernmost parts of Scotland will, we are sure, be as favourably entertained upon its merits as would be one from Middlesex. Let our Scotch brethren put forth two or three candidates at the next election, and so practically test whether the feeling of exclusiveness really exists. Scotchmen are to be found upon the committee.

#### THE NATIONAL CHRYSANTHEMUM SOCIETY.

—A meeting of the general committee took place at Anderson's Hotel, Fleet Street, E.C., on the 3rd inst., Mr. E. SANDERSON, President, in the chair, nearly the whole of the members of the committee being present, including several representatives of local societies. The minutes of the last meeting having been read, the Hon. Secretary, Mr. WILLIAM HOLMES, announced that the arrangements for the annual dinner on the 13th had been made. A cordial vote of thanks was passed to the members who had acted as stewards of the November exhibition at the Royal Aquarium. Mr. C. H. PAYNE, the Foreign Corresponding Hon. Secretary, announced that a

growing interest in the Chrysanthemum on the Continent and the United States was shown in the applications he had received for catalogues, including some from Barbadoes and Constantinople. He had also received applications for membership from foreigners, and suggested that Americans should be required to pay an annual subscription of a dollar, and French and Belgian members five francs each, to cover cost of postage of documents, &c. Eventually Mr. PAYNE was requested to prepare a scheme for foreign membership, and bring up the same at the next meeting of the committee. The Society having offered for competition among societies affiliated with it a Challenge Trophy, to be in the custody of the President of the society winning the same for the space of the year, a sub-committee, consisting of Messrs. E. SANDERSON, R. BALLANTINE, and P. C. JUKES, was appointed to procure a salver, at a cost not exceeding £15. A letter was read suggesting that a Chrysanthemum Conference should take place on the day of the annual dinner. Eventually it was unanimously resolved that it should take place at the Royal Aquarium in connection with the winter shows on January 9 and 10, and a sub-committee, consisting of Messrs. C. H. PAYNE, L. CASTLE, and G. GORDON, were appointed to make arrangements for carrying out the same. The Hon. Secretary announced in reference to a provincial show in 1889, that he had received applications from York, Leeds, Hull, Derby, and Brighton, in each case a further application would be received, setting forth the proposed terms upon which such an exhibition could be held. The question of the proposed celebration of the centenary of the importation of the Chrysanthemum to Europe was postponed for the consideration of the new committee to be appointed in January next. Thirty-four new members were elected, including two new Fellows; bringing the total membership up to 630. The Hull and East Riding Chrysanthemum Society was admitted into affiliation. A vote of thanks to the Chairman closed the proceedings.

**BROMELIACEÆ.**—We are pleased to announce that Mr. J. G. BAKER has in the press this winter a *Handbook of Bromeliaceæ*, on the same plan as his *Handbooks of the Fern Allies and Amaryllidææ*. Upwards of 700 species are now known, which is twice as many as Mr. BENTHAM estimated in 1883. About 250 of them have been, at one time or another, in cultivation, and of nearly all of these fine coloured figures, life-size, are contained in the splendid collection which was made by the late Professor EDWARD MORREN, and after his death purchased by the BENTHAM Trustees and presented to the Kew library. The London herbaria contain specimens of about half the known species. Mr. BAKER has visited Paris; and also had the loan of the entire Berlin collection, and has found in these more than a hundred undescribed species. Dr. WITMACK is going to publish very shortly a paper on LEHMANN'S Bromeliaceæ, of which about thirty are new. The collections made by ANDRÉ in New Grenada and Ecuador have now been thoroughly worked out by himself, and are found to contain about sixty novelties.

**PLANTS IN FLOWER IN THE OPEN AIR AT KEW.**—It is almost unprecedented to see so many Alpine and herbaceous plants in flower at this time of the year at Kew. Many plants are growing fast, such as Clematis, with young shoots 3 or 4 inches long. Rhododendrons are just bursting into flower; a Smilax are also noticed covered with flowers—indeed almost all plants are in such an advanced state as one only expects to see about February. Many species of *Wahlenbergia saxicola*, *Schizostylis coccinea*, *Brodiaea Leichtlinii*, *Crocus Clusii*, *C. ochroleucus*, *C. Cambesidensis*, *C. serotinus*, and many others, including *C. alaticlavus* albus and *C. Korolkowi*, spring flowering; *Lychnis pyrenaica*, *Arabis procurrens*, *Anemone blanda*, *Lithospermum prostratum*, *Sternbergia lutea*, *Campanula Portenschlagiana*, *Polygala chamaebuxus*, *Triteleia uniflora*, *Helleborus niger*, and other species; *Aubrietia deltoidea* and vars., *Viola odorata*, *V. tricolor* vars.,

*Symphytum tuberosum*, *Grindelia lanceolata*, *Aponogeton distachyon*, &c.

**BOTANICAL MAGAZINE.**—The December number, which completes the sixty-fourth volume of the third series, contains illustrations of—

*Begonia Scharffii*, t. 7023.—An introduction of Messrs HAAGE & SCHMIDT, of Erfurt, from the Island of St. Catherine, South Brazil. It is one of the grandest species of this popular genus. The plant is about 18 inches high and hairy, the branches, flower-stalks, and the under surface of the leaves are blood-red, the leaves are dark green on the upper surface, with reddish nerves, and are about 1 foot long, very obliquely ovate-cordate, with rounded lobes, and an acute sinus. The flowers are white with a few red hairs outside, the male flowers being 2½ inches in diameter; sepals round, petals narrow. The females have elliptic segments, and measure nearly 2 inches in diameter.

*Iris Suawarwi*, t. 7029.—A native of Central Asia, being gathered wild in Turkestan by Dr. REGER in 1885. The segments of the perianth are closely veined with oblique claret-purple lines on a ground of greenish-yellow. The outer oblong-cuneate with a lilac-blue beard; inner oblong with a long claw, sometimes bearded. The glaucous green leaves are ultimately 1 foot long and a quarter of an inch broad. The flowers are borne singly, on a peduncle 1 foot long, bearing much reduced leaves.

*Pentapera sicula*, t. 7030.—An ericaceous shrub, with pale pink flowers. A native of Sicily, and also recorded very recently from Cyprus and from Barca. Illustrated in our columns for September 23 of this year, p. 335, fig. 45.

*Hecivia bidentata*, t. 7031.—This Orchid is an introduction from the United States of Columbia, Panama, and Nicaragua. It has flowers of scarlet, about 1 inch in diameter, and borne from between the leaves in few-flowered racemes; the segments are ovate-oblong, obtuse, petals smaller than the sepals. The lip is sharply deflexed from the claw, which is adnate to the column; it has straight sides and a triangular apex, which is bifid, and darker than the rest of the flower. It is pointed out that the lip is not erect in the specimen figured, whereas in the *Genera Plantarum* it is stated to be one of the characters of the genus.

*Prinula Rusbyi*, t. 7032.—This is a very pretty recently discovered American Primrose, and was introduced into this country by Mr. A. DEAN, Bedford, in 1885. It was first found on the Mogollon Mountains, in New Mexico, by a traveller whose name it bears. It has also been found on the summit of Mount Wrightson, in Arizona. The drooping flowers are bright rose-red, with a darker eye, and yellow in the tube, which is not thickened. The leaves are 3–5 inches long, narrowly spatulate, subacute, callously crenulate, and narrowed to a slender petiole; pale green above.

**HARDY FLOWERS IN DECEMBER.**—Mr. BURBIDGE kindly sends us from Dublin a bouquet that would not pass muster in Covent Garden, nor obtain a Certificate from the Floral Committee—one to which little or no commercial value could be assigned, but which, nevertheless, is of great interest. We will begin with Primroses and Polyanthus, of which there is a good bunch to lure us on. Then there is a seedling single quilled pompon Chrysanthemum, of a lilac colour, and delicious aroma, the quills showy and attractive, but the real work is done by the less conspicuous flowers in the centre. *Amicia zygomeris*, a curious Leguminous plant, with huge stipules, encasing, as in a box, the young pinnate leaves, and with racemes of yellow Pea-shaped flowers, the upper sepals very large in proportion to the other three, and forming two side pieces like cheeks to the flower, or again reminding one of those plates of gold with which Dutch ladies are wont to bedeck their temples. Doubtless these two side pieces, like the stipules in the case of the leaves, are in some way connected with the protection of the flower-bud in the young stage, or with the fertilisation of the flower, or both. *Senecio pulcher* is very showy with

its brilliant lilac flower-heads, but there is a lack of refinement and "finish" about the plant that seems to call for the aid of the florist. *Eurybia argyrophylla* is remarkable for its bold, Holly-like foliage, the under surface of the leaves being covered with white, felted down; when crushed the leaves emit a fruity odour. Then there is that strange, straggling skeleton Bramble, *Rubus australis*, that no one would value it for its appearance alone, but so curious that the botanist would find it as much to his catholic tastes as the most gorgeous *Cattleya*. The leaves, in fact, are reduced to their ribs, and these having nothing to carry stretch out rampantly bearing at their tips just an apology for a leaflet which enables one to say that these miniature scaffold poles really are leaves. There is not much leaf-green (chlorophyll) in the plant, but what there is, must needs work hard. Another straggler equally interesting, but more beautiful is the *Cuscuta verrucosa*, a leafless twiner with clusters of white, bell-shaped fragrant flowers about half the size of those of the Lily of the Valley. If the skeleton Bramble had but little chlorophyll, this has still less, but it makes up for its own deficiencies by appropriating the property of its neighbours, its neighbour in this case being the pretty *Calceolaria violacea*. In fact, the plant is a Dodder, such as is common enough on heaths and in Clover fields, and which sometimes appears in the Pelargonium-house to the astonishment of the gardener, the mystery being readily explicable from the fact that the seeds are introduced with the peat used for potting. *Ficus diversifolia* has curious thick wedge-shaped leaves, the mid-rib of which branches with two equal divisions above the base. Our correspondent asks why? The only suggestion that occurs to us is that the plant, as its name implies, sometimes produces lobed leaves, and this branching of the mid-rib affords an indication of a propensity which would otherwise not be suspected from the very reniform leaves of the specimen before us. Great water pores exist on the under surface here and there, and a purplish blotch (gland?) in the fork of the mid-rib. In point of fact there are all sorts of "whys" to be asked respecting this curious plant, to not a few of which it would be difficult to find an answer, all the more interesting to the searcher after truth. The specimen before us bears several of its small ovate "figs," the marvels of which have been desecrated on from time to time in our columns by Dr. GEORGE KING and Mr. HEMSLEY. Lastly, we may mention the "Buffalo-grass" *Stenotaphrum americanum*, remarkable as a forage plant and for the thick flattened rachis on which the florets are borne.

**H. ALOIS KROPATSCHEK.**—This well-known correspondent on horticultural matters in the pages of a contemporary has been appointed as Head Gardener at the Imperial Gardens at Laxenburg, near Mödling, Upper Austria, in place of H. J. EHRLICH, who has been transferred to the Prater, Vienna.

**A GOOD LACQUER FOR LABELS.**—The *Revue de l'Horticulture Belge et Etrangère* gives the following as a means by which garden labels of wood may be rendered lasting:—After writing the name on the labels they are to be coated with a solution of gum arabic digested in 90 per cent. pure alcohol, using a soft camel-hair pencil, and observing to cover the edges of the label thoroughly. When this lacquer is dry it is brushed over with another made from mastic ten parts, two-tenths fluid storax, and thirty-five parts alcohol.

**RETINOSPORA PLUMOSA.**—In a garden at Canterbury the other day we noticed a shrub of this denomination covered with unmistakable cones of *R. pisifera*. Earlier in the year we saw at Wolverston Park a bush of *R. squarrosa*, of which Mr. Sheppard kindly sent us a specimen, and which was also covered with cones of *R. pisifera*. These cases afford proof that both *plumosa* and *squarrosa* are only forms of *R. pisifera*. Cats have nine lives,

greenfly nobody knows how many, and many plants live under many different guises.

**PANDANUS FURCATUS.**—Of this rather rarely met-with plant, Mr. HARROW, Cambridge Botanic Garden, says—"It is only in very large glass structures that the large growing species of this genus can be accommodated, and this is one that requires a good deal of room to develop its foliage which, when this is effected, gives the plant a handsome appearance. Both margins of the leaves are set with numerous sharp reddish-brown spines, as is also the keel, and here some spines point towards the apex while others are reversed, as if to make the plant extra secure against invasion. Your correspondent, 'W. W.', p. 631, mentions, that 'It is only rarely that cultivated species of *Pandanus* flower.' A female specimen, some 10 feet or more in height, planted out in a cool stove here, has flowered twice during the past three years. There is nothing remarkably handsome in these huge, ponderous, cone-like inflorescences. Previous to its last time of flowering, a cone was allowed to remain on the plant, which, when ripe, scented the whole house with a very powerful perfume resembling that of Pine-apple and Melons, quite a mixture, but the flavour was rather inferior, and not to be compared to its odour."

**SEASIDE SHRUBS.**—For a genuine evergreen with silver and golden varieties (the variegation being either temporary or permanent), commend us to the Japan Spindle tree, *Euconymus japonicus*; but if variety be needed, *Ligustrum ovalifolium* may be introduced. It is all but evergreen, and bears the sea blast with impunity. *Tamarisks* and Austrian Pines do thoroughly well on the Kentish coast, but the Pinaster cannot be recommended, its gaunt, straggling branches being suggestive of nightmare or other horrors rather than of shelter or elegance such as one looks for in a tree. *Cupressus macrocarpa* and *Pinus insignis* are quite at home in some seaside places, and *Ribes alpinum* is in such a hurry to set up business that its buds are already half open.

**FLORAL DESIGN.**—Some of our earliest attempts at handwriting, if it may be so called, were made with the aid of Mustard and Cress duly sown in the forms of letters. We were reminded of this the other day by seeing the name of a hotel at one of the south coast towns picked out with alpine *Auriculars*. In this mild season most of the *Auriculars* were in bloom, so that the floral caligraph was every bit as distinct as it would usually be in spring; and, indeed, much more so than it is likely to be next spring.

**ROYAL SOCIETY MEDALLISTS.**—At the anniversary meeting of the Royal Society, held at Burlington House on St. Andrew's Day, the Medals awarded by the Council were, according to custom, formally presented after the delivery of the presidential address. The Copley Medal, the most ancient of the Society (dating from 1736) was given to Professor HUXLEY; the Rumford (which dates from 1880) to Professor TACCHINI; and of the two Royal Medals (first founded in 1826 by GEORGE IV., and continued by each succeeding sovereign), one was given to Professor OSBORNE REYNOLDS, and the other to Baron VON MÖLLER, as was mentioned by us in our issue for November 24; while the Davy Medal (originated in 1877) was given to Mr. W. CROOKES.

**ENGLISH APPLE AND FRUIT GROWING CO.**—We are requested by Mr. A. F. BARRON to state that he is not, as advertised, a director of this company, his position in that respect having terminated some time ago, other duties requiring all his attention.

**CARTER'S PROVIDENT SICK FUND.**—The third annual meeting was held recently in the warehouses of the firm at High Holborn, Mr. C. H. SHARMAN in the chair. The number of subscribers during the year had been 289—making a total of 449, there was no case of death to be recorded; but fifty-three

members had become chargeable to the funds, by reason of sickness, and the payments on that head were in excess of the previous year. Nevertheless, a further sum of £25 could be carried to the reserve fund, £10 to the Hospital Saturday Fund, and a bonus distributed to the members at Christmas which will amount to rather more than half the year's subscription, and a working balance would still be held in hand. The executive officers were all re-elected.

**PULQUE.**—This product of the young flower-spice of *Agave americana* is such an important article of consumption in Mexico that it forms the principal item in the goods traffic of the Mexican Railway Company, the report of the company showing that in the half year ending December 31, 1887, they carried no less than 41,607 tons, which brought in for freight as much as £35,376.

## ROSES.

### ROSES FOR WALLS AND FENCES.

BESIDES the *Noisettes* of the *Gloire de Dijon* type which I have already enumerated there are others of a different character, which will be found very suitable for these purposes; it is well for those who are able, to give them the benefit of a wall, but a substitute for it may be found. I have a letter before me from a friend in Ireland who says that he has erected a wooden wall about 14 feet high, has painted it a terra-cotta colour, and placed wire along it; on this wire he has trained fruit trees, which are doing well, and look very handsome. There is no reason whatever why the same should not be done for the purpose of growing Roses; it will last, if well attended to, for a great number of years, and of course the comparative cheapness with which it can be done is much in its favour. As the place where my friend has raised his wall is in the wind-swept county of Clare, there is evidently stability as well as cheapness about it, and lovers of Roses may be tempted to imitate the example.

The Roses already mentioned are nearly all yellow, but there are amongst the *Noisettes*, Roses of other shades of colour which are very effective. There is *Aimée Vibert*, a very old Rose—indeed, one of the oldest we have in cultivation; it was sent out by Vibert in 1827. It is said by Ketten in their catalogue to have been a sport of the *Noisette* "Repus;" it is pure white, sufficiently full, very free flowering, and blooms in clusters. This is also another white well known to many.

*Lamarque*.—This was raised in 1830; it has a slight saffron tinge in the centre, which has no doubt been the origin of the yellow sport sent out by Ducher in 1869 under the name of *Lamarque* Jaime, like the type, but with bright yellow flowers. As a white climbing Rose, *Lamarque* has long been valued.

*Fellenberg* is a light crimson *Noisette*, very bright and effective, blooming in clusters.

*Narcisse* is a Rose which I have seen in some situations, notably at a friend's house near Maidstone, as a capital Rose for covering a wall; the plant I allude to was always full of flower, and I have seen some exhibition blooms cut from it.

*Solfaterra*.—Sulphur-yellow, of long straggling bare habit, the flowers very light, but very apt soon to open too much and show the eye. There is a fine plant of it on a house close to me, facing the south, which always blooms freely; it suffered in the severe winter a few years ago, but has made a fresh start and is now doing well.

*Ophir*.—A light nankeen copper-yellow, very distinct and full.

*Rève d'Or*.—I have already mentioned this, but it is impossible to give a list of climbing Roses without again referring to it; my plant is on the east side of my house, but withal it flowers most freely, and is a delight when in full flower; the foliage, too, is close, and almost evergreen. Nor would the list be complete without naming

William Allen Richardson—for although not

actually a climbing Rose, its growth is so vigorous, and its flowers or buds so charming that it is impossible to pass it by. Who has not admired the deep orange buds (for an expanded flower it is worth little), and how many fair dames have rejoiced in it as forming such "loves of blooms" for a breast or shoulder bouquet? Sometimes it loses its colour on a wall in hot weather, and is perhaps more suitable for a pillar.

Amongst Tea Roses, as distinguished from Noisettes, it is somewhat remarkable that there has not been a greater starting off into climbing varieties than there has. As far as I am aware there is but one of those in commerce which has developed this rampant habit. You may have strong growers, such as Marie van Houtte, Catherine Mermet, and others which will soon cover a space on a wall or fence, but they are not climbers.

*Climbing Devoniensis* is the only one as yet in commerce, and is one of the most remarkable instances of divergence from the type that can be seen. *Devoniensis* itself is a moderate grower, but here is a Rose which has no one knows how (although we do know where) is, in Mr. Pavitt's garden in Bath, developed into the most rampant climber, sending out shoots 15 to 20 feet long in a season, and retaining the beautiful flower of its type.

I have said that there is only one in commerce, but I hope that shortly we shall have another:—

*Climbing Niphetos*.—This was exhibited by Messrs. Keynes, Williams & Co., at one of the Royal Horticultural Society's meetings, and was awarded a First-class Certificate, and deservedly so. It retains the character of the type as far as bloom is concerned, and we know that there is no such popular Rose, even surpassing *Maréchal Niel*, as it comes in so usefully for wreaths for either weddings or funerals, and I am informed that shoots from plants worked in May have attained the length of 15 feet. How beautiful it will be climbing up the rafters of a Tea-house!

Passing on to hybrid perpetuals, of these there are a few which are distinct Roses, and others which are only rampant sports of previous varieties, thus amongst the former we have:—

*Princess Louise Victoria*, raised by Mr. Knight of Battle, who, like Mr. Ward, the raiser of John Hopper, must rest his reputation as a raiser on one Rose. It was sent out a good many years ago, and is a very strong grower, of a light pink or rosy-flesh colour, and of good form; it does not attain exhibition size, but if allowed to grow it will furnish a large number of particularly fresh and light blooms, which I saw excellently employed in one of the prettiest baskets of Roses I ever saw exhibited at Eitham by Miss Bloxam last July—baskets of Roses are generally "lumpy," but this was light and graceful.

*Longworth Rambler* has been in some catalogues put down amongst the hybrid Teas, but that really means hybrid perpetuals, and is a very free-flowering deep crimson Rose; the foliage is very ample and completely covers the wall—its growth is rapid and it blooms freely in the autumn. Another is:—

*Reine Marie Henriette*, a deep carmine, but a flower that soon fades off into dull magenta; it has a long pointed bud, and is very pretty before it opens fully.

Of the new series of Hungarian Roses I know nothing; they are said to be hardy, but they all have the character of lilac-purple attached to them, and we know what that means. Amongst the sports which have arisen in the hybrid perpetuals—sports in growth, not in bloom—may be mentioned climbing Charles Lefebvre, climbing Captain Christy, climbing Pride of Waltham, climbing Jules Margottin, climbing Bessie Johnston, climbing Edouard Morren, climbing Countess of Oxford, and climbing Mdle. Eugene Verdier; as I have said, the blooms of these partake of the character of the types.

It will thus be seen that there is a great variety of climbing Roses to choose from. I have not mentioned the summer-flowering, such as the *Ayrshire* and *Prairie* Roses, or the species of single-flowering Roses, many of which are very beautiful, but rather fleeting in their character. *Wild Rose*,

## PHILLYREA DECORA.\*

The genus *Phillyrea* belongs to the Olive family, and is a near ally of *Osmanthus*. It contains four species, all of which are in cultivation. The three Mediterranean plants, viz., *P. latifolia*, *P. angustifolia*, and *P. media*, although distinct enough in their typical states, are united by so many intermediates, that Caruel and Timbal have merged them under one species, with the respective names of *P. vulgaris*, Caruel, and *P. variabilis*, Timbal. By far the best plant of the whole lot—and a considerable number of forms have received distinctive names—is the one figured (fig 96). It is a strikingly handsome shrub, of whose claims to specific rank there can be no doubt. It is also much the hardiest, having stood many years at Kew without ever being in the slightest degree injured by frost, though more than once within the last fifteen years the other three have been badly cut during severe winters. Another point in favour of *P. decora* is the fact that it is an excellent town shrub, its rigid glossy leaves seeming quite at home in the smoky dust-laden atmosphere of London.

From its general aspect the subject of the present notes might be mistaken by a casual observer for a fine form of the Portugal Laurel, the dark green leaves varying from 2½ to 4½ inches in length by a width of 1 or 1½ inch. The pure white flowers, fully double the size of those of *P. latifolia*, are borne in May in clusters in the axils of the leaves, and the reddish-purple fruits ripen in September. According to its discoverer it attains a height of 10 feet. The figure in the *Botanical Magazine* was prepared from specimens which flowered in 1883 in the nursery of Mr. Anthony Waterer, at Knap Hill, and the fruiting twig here represented was taken a month ago from a plant in the Kew Arboretum.

Fruits, no doubt collected in 1886 by Balansa—the discoverer of the species—in the native habitat of plant, viz., Lazistan (the Pontus of the ancients) on the south-east shore of the Black Sea, were offered at 15 francs per hundred in the Supplement to the Catalogue of Messrs. Vilmorin-Andrieux & Co. for 1887. The description there given is a good one, and antedates by some dozen years that under another name in Boissier's *Flora Orientalis*. Besides, the plant being as frequently met with under the name of *P. decora* as under *P. Vilmoriniana*, we have another reason for following the laws of botanical nomenclature and accepting the older name, *Geo. Nicholson*.

## CHRYSANTHEMUM CULTURE.

The following papers were read at the Chrysanthemum Conference held at Sheffield on Friday, November 16. We append an abstract of the more practical extracts of Mr. Tunnington's "A Chat about Chrysanthemums."

### THE BEST TIME TO STRIKE CUTTINGS.

This is a point on which a variety of opinions exist. My experience has led me to divide the plants into two sections, and to treat them differently. In this matter I have found that Japanese require a longer season of growth than the incurved section, except a few varieties, such as *Barbara*, *Eve*, *Mabel Ward*, &c., which should be rooted with the Japanese; those we strike in December, and the incurved by the end of January or any time during February. I have always succeeded in obtaining better flowers with broader florets by late than early striking. This applies especially to the Empress and Queen group. All the growers about Liverpool do not strike their cuttings on the same principle. Some insert them in cold frames, some place them thickly together in pots and place them on a shelf, and are not particular about flagging, and so on. I make up a slight hot-bed in a vinery about to be started, with leaves and

a small quantity of manure. Particular care is taken that the heat is only of the gentlest description, in order to prevent the cuttings from flagging, and at the same time assist them to root in less than half the time than would be the case by cool treatment. Weak growers are rooted singly in small pots, and also those intended for trained specimens. Others are rooted together in 5 or 6-inch pots. By the time the plants are rooted hotbeds are made for them in cold frames of the same description as for rooting them; they are potted singly and plunged. They become established by the time the beds cool down, which avoids checking the young plants. Weak plants, as well as those for trained standards, are potted on and encouraged by a little bottom-heat. Under this treatment they gain strength and make rapid progress. The object to be attained is strong but sturdy growth from the time the plants are hardened to cool-frame treatment to the time they are placed out in May. This is achieved by giving abundance of air and the removal of the lights as the season advances, when the weather is favourable. The weather must guide the cultivator whether he is to place the plants outside early in May or towards the end of that month. A sheltered spot should be found for them, or a temporary protection should be given to them in the case of late frosts or cold cutting winds. Every care, however, must be taken of them at this stage, for they are easily injured. I have seen the leaves blown off them, and plants subjected to such cruel treatment seldom recover.

### POTTING.

Before potting is commenced we place in the position the plants are intended to occupy, old boards, 1 yard apart, on which we stand the plants, pot to pot, until July, when they are placed 6–9 inches apart, according to the number of shoots that the plants are allowed to carry. The plants are placed in their flowering-pots during May as they are turned outside. We have found 9 and 10-inch pots most suitable, and if larger are used two plants may be placed in them with good results. In draining the pots oyster shells are preferred to crocks, whole ones at the base, and for the top they are broken up moderately fine. Over this a good pinch of soot is scattered to keep out worms and act as a stimulant to the plant. In potting, the soil that I shall recommend should be pressed firmly into the pots. When potting is finished room should be left in the pot for the addition of at least 2 inches of soil. We use turf green from the field chopped about the size of an egg. To this is added one 8-inch potful of soot, the same quantity of pounded oyster shells, the same quantity of bone-meal, and a small quantity of leaf-mould to each barrowful of sod.

### THE MAY BUD.

There appears to be a good deal of misconception about the May bud. In my opinion it is the result of a check or early striking, and I scarcely remember an example of this when the old stools have been cared for and the plants struck at the time suggested. My advice is, avoid this bud. In nine cases out of ten it throws the bud that should appear from the middle of July wrong. If the plants show this tendency help them out of it as quickly as possible by removing the points of the plants, and select three or four shoots to carry one bloom each. In the case of doubtful kinds that occasionally go blind stop them in May and run up five or six shoots, and when you have secured the right-time buds and observe them swelling, thin out the shoots to three or four. If we do not stop them we always run up more shoots than we intend to retain—that is, from the natural break in July. We stop some and grow others without, and then seldom fail to secure a good flower at the time it is wanted.

### FEEDING.

We feed very little before the bud is secured. What we are in the habit of using is liquid from the farmyard diluted with water and, a little soot dusted on the surface of the soil during showery weather.

\* *Phillyrea decora*, Boiss. et Bal., in Vilmorin-Andrieux et Cie, Supplement aux catalogues, on liste des plantes qui paraissent pour la première fois sur nos catalogues (1867). *P. Vilmoriniana*, Boiss., *Flora Orientalis*, vol. iv., p. 37, (1879); *Botanical Magazine*, 6800. *P. Vilmorinensis*, *Gardeners' Chronicle*, ser. ii., vol. xx., p. 494. *P. laurifolia*, Hort.

A few years ago we had in the garden a cesspool, the contents of which, liberally diluted with water, I found an invaluable food for the *Chrysanthemum*. To those who have not used it my advice is give it a trial. At one time we had practically only natural liquids, but nowadays we can make liquid from such a variety of special manures, or dust them on the surface of the soil, and most if not all of them are useful for a change.

#### TAKING THE BUD.

I have said I am a little later than most growers in securing buds. For the incurved I do not care to take them before the last week in August, or the first three weeks in September, though some of the Japanese might be taken earlier. The aim of the cultivator should be to secure them during the latter

vator has a slightly different method, and all plans answer the purpose, as long as the plants are not broken, and each shoot is secured separately, so that light and air can reach them on all sides. One other matter of importance is, that we allow all the shoots of our plants to sway loose 18 inches above the tie, which saves many points from breaking. Some say birds will break the shoots if they alight upon them, but in over twenty years I have observed a solitary robin on these plants, and the shoot it rested on did not break. Damage is mostly caused by wind and rain, when the plants are tied too near the top.

#### RIPENING THE WOOD.

I do not attach much importance to this; all that I have ever found to be necessary is to stand the plants sufficiently far apart so that light and air can

the limit of the pot by placing pieces of turf above the rim. The soil when the flowers are expanding should be full of active roots. This keeps the lower foliage in a healthy condition to the last. Here lies the secret of large flowers possessing depth, solidity, and breadth of petal.

#### AFTER HOUSING.

Now begins one of the most critical periods in the plant's life, and many plants go wrong from the day they are housed. Many a young grower has had all that could be desired in the way of plants, and evil results have followed a continuation of the treatment the plants received outside. The same strong feeding must not be continued for a time. The plants sulk after losing what they delight in—namely, night dews. If bright weather continues, consider-

FIG. 96.—*PHYLLEIA DECORA*: FLOWERS WHITE, FRUIT REDDISH-PURPLE. (SEE P. 672.)

dates. When plants have been pinched in their earlier stages some of the shoots will show before others, although on the same plant. This can be regulated to a very large extent in July; for instance, if they show early in that month allow them to grow on until the middle of that month. They must then be pushed to make the next growth by clearing out lateral growths from the axils of the leaves. At this stage examine the remaining shoots on the plant, and if small growths have commenced showing in the axils of the leaves rest assured that a bud is forming. My plan is to clear out all growths as in the preceding case, take out the point of the plant, and do for it what it would otherwise do for itself. But if left alone it would come in too late to be of service for showing.

#### STAKING AND TYING.

This may be passed over, for nearly every culti-

play all round them. The ripening of the wood depends largely upon the time the bud is taken. Ripening commences rapidly after bud-formation and the leaves below it have fully expanded. If the buds are taken too early in August the wood in some seasons ripens too much, and the result is a flat flower and a multitude of narrow petals. Over-ripened wood is, in my opinion, the cause of smaller flowers in the South, and narrower petals than we are in the habit of producing.

#### TOP-DRESSING.

I advised room in the pots for 2 inches of soil, and this space is to be filled up with rich material as a top-dressing for the plants. This is an important matter. It keeps the roots in full activity, and they are therefore capable of taking up food much more freely than they could possibly do if the roots became sluggish. We top-dress to the extent of exceeding

ably more moisture is evaporated from the foliage, and any failure in making up for these deficiencies will prove detrimental to the plants. Syringe them thoroughly two or three times a day, according to the weather. When they are accustomed to their new quarters we feed again on the same principle as before housing, and continue to do so until the flowers are ready for cutting. We fumigate with tobacco-smoke after housing, for neither plants nor flowers will thrive if fly exist upon them.

I shall pass over the subject of dressing, for enough has been written about it,—in fact, sufficient to frighten a beginner. My advice is, grow the flower fully out, as, however good the dresser may be, he cannot make a good bloom out of a bad one.

#### KEEPING THE BLOOMS.

After they are expanded, put them into a dark outhouse as dry as possible. Once I had occasion

to place some plants in a certain shed, and there was some time in a corner that was just falling. This I had always thought assisted in keeping them by absorbing the moisture in the atmosphere. The flowers kept three weeks, and were staged in good condition afterwards. I give this for what it is worth, and think it well worth trying. My last advice is, beware of fogs if real success is to be attained, for in one night they will undo the work of the whole season.

### INFLUENCE OF WOOD RIPENING ON BUDS AND BLOOMS.\*

The ripening of the wood of *Chrysanthemum* is a very important matter in the growth of these plants for the production of high-class blooms; indeed, without perfectly ripened wood it is impossible to have blooms of the finest quality in all respects. Let it be understood that what I mean by perfectly ripened wood is wood that is ripened sufficiently by natural means as the result of correct treatment throughout. Sun is essential for the maturation of plants in all stages of their growth; but in some seasons and districts there may be too much of it, and in others not enough, and we must make the best of both circumstances. Wood-ripening does not consist in merely hardening the wood, but storing it with nutriment for the blooms. Forcing the ripening, so to say, by drought or in other ways, contracts the sap vessels unduly, impeding the free flow of nourishment for the blooms at a critical time, and those persons who practise such methods in cultivation act erroneously, and fail to produce the best blooms.

Seasons vary so much that the locality in which growers reside is a very important factor in the production of good or bad blooms. Circumstances occur over which cultivators have no control, which prevent them showing the ability they may be admitted to possess. They cannot, for instance, excel during a cold wet summer in a low damp district. The higher and drier the locality the harder the wood and the greater the disposition of the plants to set buds prematurely. Where buds are persistently formed long before the time we wish to see them much valuable time is lost in the growth of the plants in their various stages during the time the buds are forming. Moreover, high and dry localities predispose to narrow petals, and rather small but solid blooms; while reverse conditions are conducive to the formation of broader petals and larger blooms. Where the locality is high the air, although much rain may be registered, is drier than in the lowlands, and it is this dry air that precipitates bud formation that gives so much trouble to some growers. The proper time to "take" buds of some varieties is upset altogether under such conditions. They form either too early or too late for producing the finest blooms.

Then the question of dew is important. During a hot and dry summer, as in 1887, the absence of dews in high-lying districts is much felt. Dew invigorates, and its scarcity or absence has been the cause of many small blooms. We can regulate and control moisture in the soil, but have practically no power over it in the atmosphere. We may do our best, and may do some good, but, after all, the most we can do is but little in providing compensation for what we may consider the shortcomings of Nature.

When the growth of plants is soft and gross, the latter particularly, and the wood pale green instead of brown in colour, a want of ripeness is evident. Such plants produce blooms large in diameter, but they are usually lacking in depth and solidity of the petals. This is more noticeable in the incurved section than in the Japanese family. Blooms which are composed of extra broad florets are seldom if ever as solid as medium-sized blooms, having narrower petals; neither can the former be considered of such high quality as those deeper in build

and consequently firm and likely to stand fresh a long time. Blooms having unusually broad florets often show decided roughness and irregularity, and the dresser is not able to present such blooms in the same highly finished condition as when the petals are narrower and the blooms more solid.

The present season is considered to have been a bad one for the growth of large high-class blooms, especially in the incurved section. This is borne out by examples which have been staged at various exhibitions. It cannot be said they have been of the highest quality, or as they have been shown in some past seasons. Some stands have been extra heavy in the size of the blooms, owing to the immense breadth of their florets, but many of the blooms lacked depth in proportion to diameter, consequently, they were not so solid as they would have been had the blooms been deeper in proportion to their breadth. After a summer like the past one, we expect to see large blooms which lack solidity and closeness of the petals, a condition which is owing mainly to the unripened state of the wood. I am not in favour of extra large blooms of the incurved section, which are only large in one way—diameter, for the reasons stated—they lack depth and solidity. My idea of an incurved bloom is one not great in diameter alone, but deep and firm in build, consequently of a better shape. Such blooms are never seen with extra broad petals, but they carry what is known as a good "shoulder," being more Orange-shaped. Such blooms as I have described are the result of perfectly ripened wood, and are seldom met with after a season like the past. Where prizes are offered for the premier incurved bloom in a show, this honour generally falls to a specimen of the character indicated, and not to a flower which has merely two points in its favour—extra width of bloom and broadness of florets. Blooms which are generally chosen for this honour are usually remarkable for solidity and high finish, which two latter qualities cannot be obtained from blooms which have extra broad and thin florets. The ripened character of the wood is the all-important factor in the production of blooms of the highest possible standard of excellence, and the complete maturation we seek is obtained, as far as seasons allow, by careful treatment from the beginning.

### CULTURE.

The method of culture I advise as the most likely to obtain the desired end is that of growing the plants from the first stage on to the culminating point in a regular steady manner, not by starts and stops, such as applying water regularly for a time, then neglecting the plants for a few days. Regular attention to potting is important, or before they become so root-bound many roots must be broken in the process, causing a check to the steady progressive growth that is so desirable in plants for producing the finest blooms. Crowding the plants in their younger stages of growth is most hurtful, and antagonistic to the development of vigorous wood and foliage. Sufficient space should always be allowed the plants. When in their summer quarters they should be arranged in an open position where the sun can shine directly on them, but the position should be protected from north, east, and south-westerly winds, which are often so destructive early in the season when the plants are first placed out of doors. Many plants have been so injured by a loss of their lower leaves during May, that they have never recovered the desired strength. South-westerly winds, which are prevalent during the end of August and the early part of September, often do much damage to the buds and leaves where the plants are much exposed. The flower-buds and their peduncles are at that time so tender that the skin may be much injured by being whipped about, so to speak, that a check occurs to the development of the blooms owing to the tissues being broken, thus checking the full and regular flow of sap.

Some growers set too much store on plants with extra thick stems and gross green leaves. These

are, perhaps, pleasant to look upon during the summer by the uninitiated, but when the test of good culture comes to be looked for, blooms possessing the desirable characteristics are generally missing. Very exuberant plants produce blooms devoid of solidity and other essentials as a rule.

It is possible in some seasons to have the plants ripened too much in dry localities. The summer of 1887 was a most trying one to contend with in high and dry districts, where not a drop of rain fell for eleven weeks, and scarcely any dew during a greater part of that time. The remedy in this case is to shade the pots from the sun during the hottest parts of the day, by boards set on edge in front of them, by Fern, cocoa-nut fibre, or mats. Thus the roots may be kept in a cooler state than they otherwise would be with the sun shining directly on the pots most of the day. In the absence of shade to the pots the roots on the sunny side are almost sure to be killed, and we all know what that means. Plants in low-lying districts invariably produce the broadest florets, and the largest but not the best wearing blooms. The advantage of those which are more solid in character is often exemplified when the two kinds have stood two days at a show and borne the heat of crowded rooms. Those which are firm remain so longer than those which are more or less loose. These latter quickly show an "eye," which proves their weakness and non-sustaining form.

Flower-buds are generally produced upon plants at a more regular time in the various stages of growth when the plants are steadily, hence properly, ripened than when they are not, except in very high and dry localities, where they ripen their growth too early, causing premature bud formation; this must be counteracted as much as possible, though it cannot always be prevented. Growers in the extreme southern counties often experience too early bud formation, caused by a too early ripening of the wood which their northern brethren are strangers to. This generally occurs with the whole of the Queen group. The plants forming flower-buds at times between the end of March and the same time in April, causing a serious interruption in their future growth, and preventing the formation of buds at the time most desirable for the district in which the grower resides.

### VEGETABLES.

The past season, although it has been anything but favourable for fruit, has been one of the best that gardeners have experienced for many years past, for during the whole of the summer months the supply of all kinds, save Tomatos, was most abundant, and had it not been for the early October frosts, Scarlet Runners, Beans, and Peas, would have continued in full bearing to a very late period, and it was rather distressing to see rows of these, so full of blossom and pods, cut off in a night; but we have reason to rejoice over that that was left, for have we not Veitch's Autumn Giant Cauliflower, Brussels Sprouts, Broccoli, and Spring Cabbage, in fine order; Celery, Spinach, Endive, and Lettuce, all looking at their best, and consequently, with a favourable winter, the promise of a full supply for some time to come. The one great danger with Cabbages is, that after the spell of warm weather we have had they may become too "proud," and run, as the growth has been very rapid, and, that being so, it will be advisable to save all plants now standing on the seed-beds, and prick them out at once, if not already done, as the check from removal will be of great benefit to them, and they will lift with good balls for transplanting in spring.

Young Cauliflowers, too, excepting those sown late, are also too vigorous, and are almost sure to bolt, but gardeners now do not place so much dependence on autumn raised plants that they once did, as we now have not only earlier kinds, which, when sown in spring, come in quickly, but we have much later Broccoli, and between the two the space

\* A paper read at the Chrysanthemum Conference by Mr. E. Molyneux, Stanmore Park Gardens, Bishops Waltham.

is bridged over, and we have either the one or the other to cut. However, I like to save some plants through the winter, and not having a large stock of handlights to spare in which to plant, I generally have a few hundred potted, as one can never make sure of them standing when pricked out under walls, or in frames, and if they do, they do not transplant half so well when turned out in the spring—and the potting takes up but a very short time.

The way we manage is to use 60-sized pots, in which we drop a good pinch of half-rotten leaves over the hole, and then finish the potting with light rich soil, after which they are plunged or stood in a cold frame near the glass, and there get plenty of air, by tilting the lights at the back, both day and night, unless the weather is very severe. By treating them thus, the plants are kept sturdy and strong, and from having no coddling, or check in turning them out, there is not that tendency to "bolt" which is so usual with others pricked out. As to Celery, I never like earthing it up till it has completed its growth, for the double reason that it cannot well be watered afterwards, and the soiling, therefore, checks growth; but what we do—and it is of great advantage and benefit to the plants when the earthing comes on—is to tie them round with a piece of Rafia, or strong matting, which keeps the leaf-stalks upright and close together, and the soiling can after that, go on at a rapid rate, as all that the man, carrying out the work, has to do, is to chop down and push forward the earth with the spade. This season has quite shown the advantage of this system, as during October we had little or no rainfall, and Celery stood in need of water as much, or perhaps more, than at any period since it was planted out, and the growth of late has been rapid. The earthing-up with us is now nearly completed, and as we grow nearly all the Incomparable or Sandringham Dwarf White, there is not much top for the frost to act on, and what there is will be and-by be covered with Bracken, or long straw. Endive soon suffers from frost, and is much more tender than Lettuce; but any one having dry sheds, either light or dark, may safely winter a good deal of this salad, or a lot may be laid in, and stored in spare pits or frames. Parsnips are best either left in the ground where they are, or dug and laid closely in rows. J. S.

#### VEITCH'S LITTLE GEM LETTUCE.

The seed of this Lettuce was obtained last January, and were sown soon afterwards, and by June 21 we had White Heart Lettuce very compact and firm. The same variety was grown all through the summer, and we have plenty of splendid stuff now. As there are so many different varieties of Lettuces, care should be taken to get this one true to name. R. C. T.

## FOREIGN CORRESPONDENCE.

### ÆSCULUS TURBINATA.

As I do not take in the *Revue Horticole* (see *Gardeners' Chronicle*, Nov. 24, 1888, p. 608), nor know where to look for it, may I ask you:—

1. Is it the Sapindaceæ given in *Phonix Zon Fon* (Kew Library), fasc. 62, fig. 17, or something akin to *Æsculus indica*, *Bot. Mag.*, 85, fig. 5117, which is very much like the Horse Chestnut I saw in blossom in Japan (probably the *E. sinensis*, which has not yet flowered with me)?

2. Does the *Revue Horticole* say where it can be got for love or money? *J. Van Volzen*.

[Mr. N. E. Brown, Kew, to whom we forwarded the above note, in his reply, says:—"It was some time before I could find out which of the Japanese books was meant, as we do not understand Japanese, and our books are not labelled in English; but having now compared the figures indicated, I see no reason why they may not represent the same species. The *Revue Horticole* only states that the plant figured came from the *Segrez Arboretum*." Ed.]

## HOME CORRESPONDENCE.

Correspondents will greatly oblige by sending early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Photographs or drawings of gardens, or of remarkable plants, trees, &c., are also solicited.

PEARS.—I should like to add my word of commendation to those of Mr. Rust, of Bridge, on p. 608, as to the good properties of Pitmaston Duchess. I crown-grafted it on to a rather wild-growing twenty or thirty year old Maréchal de la Cour bush three years ago, and this season I gathered at least a peck—nearer a peck and a half—of good medium-sized fruit from it. To my surprise and gratification, they ripened so slowly that I was able to use every fruit. I expected that it would go sleepy, but was agreeably convinced to the contrary. The fruit, for the season, was good, as no fruit, inside or outside, has been up to even its average quality in the year 1888. I am now putting it by degrees on to a fifty to sixty year old Crassane Pear tree, which, try as I will, I cannot get to fruit. It is the largest Pear tree, surely, in existence. I shall be glad to get the Duchess all over it. I am glad to hear the true history of this Pear, as many growers believe it to be a sort of sport of Duchesse d'Angoulême. Mr. Rust's note on its origin sets the matter right. Whilst on the subject of Pears, and the limitation of varieties to grow, it appears to me, that the requirements of the family for whom the gardener has to provide, as to quantity required, and the fertility of Pears in the neighbourhood must settle very largely the question of varieties a gardener grows. For instance, our consumption here goes somewhat on these lines. We begin our season in August with Doyenné d'Été, and Green Chisels—both orchard grown. By the time these are done, and they do not keep very long as everybody knows, Jargonelles are in; then Clapp's Favourite, and Windsor, followed by Williams' Bon Chrétien, and Beurré d'Amanlis. After these come Louise Bonne de Jersey, Fondante de Charneuses, a great favourite here, then Marie Louise, Pitmaston Duchess, Beurré Diel, Brown Beurre, Autumn Nelis, Welbeck Bergamot. I say nothing for Beurré de Capiaumont and Hesselis: I always market these kinds. Beurré d'Aremberg, Doyenné Gris, Maréchal de la Cour, Beurré d'Anjou, (eating now in prime condition), Winter Nelis, Easter Beurre, Josephine de Malines, Bergamote d'Espérance, with Ne Plus Mearis, and Beurré Sterckmann; these fill up the Pear season well. In addition to these twenty-five varieties we have added lately Beurré superfin, Fondante d'Automne, Beurré Hardy, Emile de Hayest, Doyenné du Comice, D. Boussoch, Souvenir du Congrès, Marie Louise d'Uccle (thirty-three varieties), in order that the house supply may not in anywise be interrupted; and to these we must put the stewing Pears, Catillac, Verulam, Triomphe de Jodoigne, Vicar of Winfield (some seasons this is fit for table—last year, for instance), and Beurré Brettineau, thirty-eight varieties, which we count upon year by year to keep our establishment supplied. It may be urged that it would be wiser to grow more of certain safe cropping varieties, but I do not see that, for the very simple reason of the short keeping qualities of Pears. To be "ripe at 12 o'clock and rotten at 1" is unfortunately too true of too many varieties, and this season this habit has been annoying in the last degree. Mr. Wildsmith, in his paper at the recent Conference at Chiswick, gave a best twelve varieties of Pears, but said, and very wisely said, he should not like to be expected to keep a table supplied with less than twenty-five varieties. He gives his twenty-five, and a most useful twenty-five they are. To sum up; the question of number of varieties must depend on household consumption and the fertility of Pears in each particular neighbourhood. Lists of varieties are useful as showing which do well in the majority of instances. I have mentioned none but what do well with us here in Notts. N. H. P.

I should not have ventured to express my views upon this very important subject were I not well acquainted with the difficulty of keeping up a regular supply of Pears throughout the Pear season; and as I have repeatedly proved that we cannot place sufficient dependence in any one variety cropping annually, I consider that twelve or fifteen sorts are not enough, and that twenty-four are

none too many, and further, I think it would be very unwise of any gardener who attempts to follow that course. I am in possession of all the varieties enumerated by your correspondent, Mr. Sheppard, at p. 553; and although I fully agree that his list contains the cream of varieties of Pears, I can assure him that with us, and growing under precisely the same circumstances, they all do not crop alike, and that while one Pear bears satisfactorily one season, it not unfrequently misses another. Taking, for instance, this season, Marie Louise, Beurré d'Aremberg, Louise Bonne de Jersey, and Pitmaston Duchess have borne splendid crops of fruit; while on the same wall Glou Morceau, Doyenné du Comice, Winter Nelis, and several other good varieties have nearly failed to crop; consequently I have been obliged to use Pears which, I may say, for the past two or three years I could very well have managed without. Emile d'Heyst was fit for use just after Marie Louise was over, and has done us capital service, as also have Huxley's Victoria, Beurré d'Aremberg, and they will be very useful in place of Glou Morceau, and they will keep good till l'Assé Colmar and Josephine de Malines are fit for use, which completes our list for this year. Beurré Rance with us is never fit for the table, being coarse, green and watery. The following is a list of those which find the most favour here, and although in some of them we find a deficiency in honey sweetness, they do not disgrace the dessert:—Doyenné d'Été, very early, sweet and refreshing when gathered from trees; Clapp's Favourite, Jargonelle, William Bon Chrétien—I believe we have two sorts of this, one being of much better colour and flavour, and keeps longer; Madame Treve, a very heavy cropper on espaliers, and becomes fit for use just after Williams'; Triomphe de Vienne, good on standards; Jersey Gratioli, a remarkably certain cropper on espaliers; Fondante d'Automne, Louise Bonne de Jersey, Pitmaston Duchess, Dron-deau, Marie Louise, Thompson's, Emile d'Heyst, Beurré Superfin, Doyenné du Comice, Huxley's Victoria, Conseiller de la Cour, Winter Nelis, Glou Morceau, Beurré d'Assé, Beurré d'Aremberg, Passe Colmar, and Josephine de Malines. H. Markham, Mereworth Castle.

ROYAL HORTICULTURAL SOCIETY.—In connection with your leader of December 1, p. 636, it might help those who are considering the system of floral certificates to state how they are now awarded, and why members are not asked to vote on plants with which they are not familiar. When a beautiful Orchid is exhibited, the award of a certificate often depends on its being sufficiently distinct from others already in cultivation, the judgment in this case mainly rests with the Orchid experts on the committee, as the majority of the other members have not sufficient knowledge of the subject, and, therefore, in many cases do not vote, and I think, wisely. Many of the Orchid experts act similarly in the case of rare alpine and other hardy plants. Some flowers bring out many voters, Chrysanthemums, for instance, but even here the opinion of the experts as to novelty carries great weight. Alpines, perhaps, have fewest voters, though with them I have never known "a verdict of two or three out of twenty or thirty then present." Friends have asked me if it was right that a single Dahlia should get a First-class Certificate, and that a grand new Orchid, such as *Cattleya exoniensis*, should only get the same award? I have for years suggested that some special distinction should be devised for plants of very exceptional merit; but this has to be done by the Council, not by the committee. At present a First-class Certificate means only that the plant is considered a novelty of great merit, or a very great advance on plants of its class. There is no comparison with plants of other classes, any more than when the same words of praise—What a remarkably fine flower—are given to a *Cattleya* and a *Primrose*. Again, I have been told that too many Certificates have been given at one meeting to Dahlias, and, offhand, this may appear to be correct; but, those on the spot see differently. Once or twice in the season the principal growers make a great effort, and send up the cream of their seedlings, selected from a vast number. As Dahlias are of many colours, red, white, crimson, purple, variegated, &c., each colour stands on its own merits. It sometimes happens that great improvements in colour or form have been made in most of the colours: in this case many certificates are necessarily awarded. As I cannot fall in with many of the suggestions which have been adopted in connection with the Floral Committee, I have given up my seat after this year, but, though freed from responsibility, I need hardly say that I wish to see it as

efficient as possible, and hope that it will keep as free from undue influence as I now believe it to be. *George F. Wilson.*

The very few certificates ordinarily granted by the Fruit Committee of the Royal Horticultural Society, probably save those awards from criticism. Although it is just possible that sometimes vegetables and even fruit may get certificated almost too freely at Chiswick. Such is human nature, that we are usually very good-natured in dispensing of that which costs us nothing, and the giving not only pleases, but possibly benefits some one else; hence many certificates are granted out of pure good nature. But it must be admitted that the Floral Committee not only does not err on the side of selfishness, but sometimes seems to have extraordinary outbreaks of good nature, so that certificates fall about "thick as leaves in Valombrosa," hence too many of these same awards attract much criticism. But the weakest element in the awards is, as you have pointed out, too often found in the fact that they are made by a very small minority of the committee present, and it is obvious that whilst in such cases the granting is a poor compliment to either the object certificated or to the exhibitor. The proposal that such awards should be made only on the authority of a full majority of the committee, seems to offer a very valuable improvement upon the present system, as not only would awards then have tangible worth, but negligent members of the committee would be forced to discharge on one side or the other the duties they have undertaken. That all such awards would be regarded with considerable respect may be taken for granted; but with regard to the proposal to publish the names of the members of the committee voting, I think that would, if sought to be enforced, create a revolt. The present method of voting does not always prove advantageous, as, although fairly private, yet no member can vote without the knowledge of all the others at the table, and possibly a desire to please, or to refrain from displeasing, may lead to votes being given somewhat partially; also it doubtless leads now to that abstinence from voting which seems to be so unfortunate. Now, I venture to propose that, if voting be enforced on all the members present at any meeting, and such enforcing will be useful if a full majority of votes alone will carry Certificates, then voting by ballot should be adopted, each member being provided with small pieces of paper or cards, on which shall be printed "for" or "against," which shall be dropped into a box, passed round the table, and, being shaken up, should be turned out on to the table, and be assorted and counted by the chairman. The work would be very easily accomplished, as twenty or so votes could be counted in so many seconds, and the result would be the real opinions of the members as to the merits of the respective exhibits without fear or favour. It is little less than a scandal when a certificate is lost by seven votes against, and six for, when the very next plant perhaps gets a certificate by five votes for, and four against. Compulsory voting would not only keep the members more thoroughly up to their work, but would also check that tendency to break away into gossip, and that upon irrelevant subjects, which a strong chairman should instantly repress, even at the expense of giving offence. It would not only bring to record the number of votes given in each case, but they should also be published, so that both exhibitors and the public might learn how large a proportion of the committee favoured the granting of the certificate. The method of recording votes proposed would, I believe, do very much in the provinces to strengthen confidence in the decisions of the committee. Without doubt certificates are eagerly sought for, not only by the trade, but also by amateur horticulturists, and as the Royal Horticultural Society is just now in great need of help, as well as of confidence, such action in relation to the committee, which would strengthen confidence in them, would also materially assist the Society in its efforts to win the confidence of the horticultural community. The proposal to appoint sub-committees having special knowledge to examine and report when such things as Orchids, florists flowers, hardy plants, Ferns, &c., are sent, is an excellent one; and provided the full committee would, after all, give to their recommendations full consideration if it was thought that the awards were made by small or select bodies of specialists rather than by the whole of the Floral Committee, the result would hardly prove unacceptable. The Council of the Royal Horticultural Society is very conservative in its actions, and hesitates to adopt broad views. Hesitancy kills, whilst

boldness and breadth of view bring life and renewed confidence. A determined plunge, therefore, into a path of healthy publicity might be productive of the most satisfactory results. *Spide.*

I have a rooted aversion to bush-fighting, and I think the Irish way of settling landlord's most objectionable; the old English highwayman's "Your money or your life," is far preferable, to my mind, as writing under pseudonyms always savours of cowardice more or less; let me, however, briefly review your correspondent (p. 607). "Over the sea," appears to me very much at sea! The composition of the Floral Committee under his guidance would be a doubtful one. As a rule, the ubiquitous gentlemen, known as "the trade," are fifty to one more alive to the value of a new plant than the amateurs; they know the horticultural world, and can tell almost at a glance the value, or want of value, of any plant placed upon the table, for after all, "the trade" may be selfish in their judgments, but these judgments usually result in the right estimate of value and beauty. Having to cater for the taste of the hour, the trade cannot afford to have fads, and if they award a first-class for a third-class production, they are soon brought to a sense of their error by the fact that the thing will not sell, and after all, money's worth must be the ultimate test of general value and utility. As a rule amateurs are specialists, and specialists are valuable when we do not get too many of them, but the composition of the Floral Committee is a very cosmopolitan one. They are specialists for hardy trees, for Orchids, for Roses, for Ferns, for herbaceous plants generally, and also for particular ones, as per example for Chrysanthemums, and almost every section of the vegetable world; but if we let the amateur element predominate where will the new plants come from? Pray tell me the result (without the trade), to the Begonias, the lovely greenhouse hybrid Rhododendrons, Azaleas, and Roses, or Gladioli, indeed, of every beautiful plant or tree which lends itself to hybridisation? Where would the present race of the most magnificent and useful flowering hardy shrubs in existence—the Rhododendrons—have been without the trade? My position will doubtless be assailed by young England with its exuberant specialism, but my three-quarters of a century experience can stand the onslaught. I next come to "Head Gardener" and agree with him in every particular even to the exhibitor's "selfishness." Just so, who is not selfish? Next comes "H., C."—Certainly Chiswick; but no Drill Hall. Then, "L."—"In the name of common sense don't have shows at Chiswick!" To "H." I will answer, In the name of sound sense go to Chiswick, and if the shows are worth coming to, the people will be sure to come; at all events people will not come to the Drill Hall! With "M." I cordially agree; and now I come to "A Fellow," and I beg to say to him, "You are a very good fellow, indeed, and have put the matter well to the fore." May such good fellows increase, and when the Drill Hall has gone back to its former obscurity and been forgotten, the Royal Horticultural Society may cease to be a laughing stock to its best friends! Just a few lines more: the threats of one or two exhibitors who say that they will not exhibit at Chiswick are worth very little, the loss of these few would be made up by twenty to one for each defaulter, I feel certain, and perhaps the presence of these loud-voiced gentlemen who will condescend to exhibit in London may not be absolutely essential to the stability of the Royal Horticultural Society, at any rate the subject is worth considering. *Charles Noble.*

**PROLIFEROUS ORCHIDS.**—I saw in two recent *Gardeners' Chronicles* a figure and account of the development of leaf-buds in the inflorescence of *Phalenopsis*. I have just found here a somewhat similar case in a little endemic *Oberonia*, viz., *Oberonia longi-bracteata*, Lindl. It is a small plant with sword-shaped distichous leaves and a raceme of minute orange flowers. In the lowest axils of the inflorescence the flowers (especially when the plant grows upon rocks and the inflorescence nods so as to touch the damp stone) are replaced by axillary buds which reproduce the plant. This is not an unusual or exceptional occurrence, but very common; in fact, almost invariable in damp rocky spots. I have seen whole patches of the plant layering thus. Another little Orchid peculiar to Ceylon behaves in a somewhat similar way, viz., *Podochilus saxatilis*—a little white-flowered Orchid, with stems about 3 inches long, covered with short distichous recurved leaves. The flowers appear in short few flowered racemes in the upper axils, and very frequently if the apex of the stem touches the tree or rock on which the plant grows, roots are emitted from it,

and eventually a stem is formed at this point, and the plant thus reproduces itself by layering. I have no doubt but that similar methods of reproduction occur constantly in damp tropical forests in other and more important species of Orchids. *Henry N. Ridley, Peradeniya, Ceylon.*

**BEURRE SUPERIEUR.**—Since my notes on the Pears of this season I have had a communication from Mr. Bunyard, who tells me that he is unable to find Beurré superieur in my list of Pears, and he is disposed to think it one of the synonyms of Comte de Lamy. This may be the case. I have grown B. superieur for thirty-five years, and have always found it as I have described it—A Pear of great excellence, but I have not grown Comte de Lamy. *W. Ingram, Belvoir, Grantham, Dec. 2.*

**WEATHER IN YORKSHIRE.**—We have here in the north of Yorkshire, passed one of the worst seasons. Some say the season is unprecedented. So far as my experience goes, I have seen nothing like it in the last forty years. In the spring everything was late, and what fruit escaped the frost was nearly all spoiled by the coldness of a sunless summer, so much so that Apples and Pears were not more than half their usual size. Farmers, too, suffered terribly from the same cause. Turnips and Mangels are only half the weight on the same ground. To add to this calamity, on October 2 we had 14° of frost, with a great quantity of unripe corn standing in the fields. The question now is, Will the unripe frozen corn make seed, or malt? I am trying the experiment now with some such corn for a farmer. Field Beans in many places were frozen to a pulp, and were a dead loss to the grower. Unripe Plums were spoiled on the trees, while the ripe fruit fared better and could be used for tarts, &c., but the flavour was very inferior. Pears and Apples grew very little after the frost, and are certainly the worst I have ever seen here. Beans, Peas, French Beans, and in fact everything tender shared the same fate. In consequence of the early frost the flower garden could be cleared off, and the spring plants planted out early. Since October 2 we have had a warm wave passing over us, so that in the North we are getting quite a St. Martin's summer. Grass and plants in the spring garden are in a fine growing state; Polyanthuses by the thousand are in fine bloom, the yellows showing off like a Calceolaria in summer—whites, too, are very conspicuous at this dull season; Pansies are also very gay, in fact every bed is now showing its proper colour; Violets are in good bloom; Peach trees are showing a new growth at the points; late Cauliflowers and Spinach are giving a good supply. *William Culverwell, Thorpe Perrow.*

**THE WEATHER IN WALES.**—I have sent for your information a list of outdoor plants at present in flower in these gardens. The present mild weather if it continue will soon do damage to vegetation—last night gave a temperature of 50° as the lowest, and a warm rain of 0.37 inch, and it is making many plants begin to move. The stormcock was singing his loudest, and the thrush is in full song, presaging windy and perhaps cold weather—which cannot come too soon. Red Currants are swelling their buds fast; Vicomtesse H. de Thury Strawberry is almost in full bloom, and other varieties are getting forward. The frosts at the end of September and beginning of October ruined all outdoor vegetation which was making up time for the paralysis of the cold wet dripping months of July and August, and the wood in fruit trees, &c., is indifferently matured. *P. Middleton, Wynnstay, Dec. 4.* [Our correspondent obligingly sent us names of about eighty different plants of which we note Broad Beans, Peas, Foxgloves, Roses, Scabious, Hydrangeas, Polyanthus, Auriculas, Currants, Ivy, perennial and annual species of Campanula, Nicotiana affinis, Laurustinus, Sunflowers, Cydonia japonica, Phloxes. We reiterate the wish of our correspondent that a seasonal change would soon occur. Ed.]

**SOILING DOWN MUSHROOM BEDS.**—Mr. Perkins, the gardener at Greendale, Henley, adopts a very simple and practical way of covering his Mushroom-beds. The beds are made up in the usual way, but instead of putting sifted soil on the surface of the manure he places turves cut fresh from a pasture, and about 2 inches in thickness. All the long unsightly blades of grass, &c., are cut off, then the turf is laid on the bed, the stems of the grass as it grew in the field, presenting at once a natural covering and tidy appearance. Another advantage is, the

turf does not become so quickly dry as loose soil, and can be more effectually watered when dry. That the beds do well with this covering there is no doubt, judging from the quality and quantity of Mushrooms to be seen, and Mr. Perkins assures me that the same beds have been in bearing for more than four weeks. I do not see why the same turves should not be used for two or more beds, as the ammonia, &c., from the fresh beds would be absorbed by the turf, and enable it to bring other crops to maturity. *T. F. D., Valentines.*

**FLOWERING POTATOS.**—The connection between flowering and tuberizing of Potatoes in this country is probably very slight. We have many kinds which flower freely, but very few which fruit. Very many of our finest kinds may, under the influence of bright sunny weather, be seen carrying literally masses of bloom, giving for the moment a charming appearance; but very soon all fall, for the simple reason that all are devoid of pollen. Just a few kinds, and mainly those fast passing into oblivion, viz., *Golden Wonder*, have not found relatives to other kinds that these free fruiterers have been exceptionally poor tuber producers. If anyone would like to test this matter fully let them obtain tubers of Woodstock Kidney, Radstock Beauty, American Purple Kidney, and in a lesser fruiting degree Reading Russet, and they will have a quartet of the freest fruiterers I have ever met with; on the other hand, I have had Magnum Bonum, Chancellor, Prime Minister, The Dean, and others to bloom with greater apparent profusion than have either of those named above, and yet not produce a single fruit. The why and the wherefore of this remarkable lack of fruitfulness presents a very interesting subject for inquiry. Many a time in attempting to make crosses between varieties I have been baffled by the impossibility, after testing scores of flowers, of obtaining a small grain of pollen. Woodstock Kidney has been such a fecund pollen producer, that it has been more largely utilised than any other as a pollen parent; but we do not want Woodstock Kidney progeny perpetually. From Radstock Beauty I have removed clusters of twenty fruits, weighing half a pound per cluster. A very interesting experiment in the case of these two kinds would be found in allowing one row of each of a given length to carry all the fruit possible, and one equal row of each to have all the bloom removed; then the tubers and fruit in the one case to be weighed against the tubers in the other case. Such a test might prove very instructive. *A. D.*

**STACHYS TUBERIFERA.**—Referring to your notices of this plant, or "Crosnes" of the Parisian markets, we are informed on reliable authority that in France they are stored in wood shavings to keep them through the winter; but of course the French climate is very different from ours. *J. Wrench & Sons.*

—I have grown the above plant this year for the first time, and find it a real acquisition as a second course vegetable. Our family and the company staying here are very pleased with it, as is also the cook. It grows without much attention, is perfectly hardy, and very prolific. Cannot you, Mr. Editor, give it a more homely name as becoming a modest vegetable? Cooks cannot very well wash their hands in *Stachys tuberosa* or *Crucifera*. *O. Thomas.* [Most menu cards being written in that language, why not adopt the French word, "Crosnes"? *Er.*]

**FRUIT TREE BORDERS.**—It is pleasant to find an old hand like Mr. Sheppard conceding, if sometimes with reservations, all the points I lay the most stress upon, namely, a border for the roots of the trees to be left uncropped, and a slope given to the cropping part of the border. We differ mainly in detail, and that may be due to the fact that Mr. Sheppard is living on a dry soil in a part of England which enjoys a warmer or at least a drier climate than other parts of the country. He would go to 5 feet, but I prefer 7 feet as the width of my fruit borders, if I had to make a large garden, or renew an old one that would admit of its being done. In small gardens it is advisable that the borders should be made of lesser width, and consequently with lesser fall from wall to wall than that which was recommended in my note. Mr. Sheppard wants no drains in a soil resting on gravel, but he should not condemn their employment in heavy land, nor the use of platforms of hard materials under the trees in clayey, shallow, and even wet soils. I know very well a large kitchen garden near London where no preparations were made for wall trees or Vines, and the produce

was very fine, especially Grapes, Peaches, and Pears; but there were specially favourable circumstances in a deep light loam overlying sand or gravel, and the water-level 80–100 feet from the surface. Similar inattention to draining and other means to good cultivation would result in disaster where the water-level is much nearer the surface, the soil heavy, and overlying clay, as is the case over much of the country. I would not use a board gangway on any border, were it not that in wet weather it is not possible to walk on a border without doing harm to it, besides bringing mud from it on to the walks. Trampling a border in dry weather results, as Mr. Sheppard says, in good only, the soil gets consolidated, and the roots ramify to a much greater extent than in loose soil. *F. M.*

**PEAR KNIGHT'S MONARCH.**—In your last week's issue, p. 641, mention is made of two varieties of Pear; I have never known but one—fruit roundish with a short stalk, and easily known from the fact that it persists in shedding its fruit when nearly ready for gathering. I find it an excellent plan to hang a net under those growing on the walls, in the same way as one does for Peaches; into these the fruits drop, when they should be carried to the fruit room and placed in the coolest place, and brought forward in November, when they will ripen splendidly. The tree grows well as a standard; and then to preserve the fruit from being bruised plenty of long mulching ought to be laid underneath the tree. The spurious variety is *Althorpe Crassane*. The Monarch was raised some sixty years ago by the late J. Andrew Knight, who wished to present the Royal Horticultural Society with scions of his seedling, and his gardener unfortunately took them from the wrong tree, hence the confusion. *J. Rust, Eridge Castle.*

**JUDGING AT WINCHESTER SHOW.**—Allow me as a disinterested (in this case) exhibitor of *Chrysanthemums* of some years' standing to corroborate the criticism contained in the report which you give of the Winchester show on p. 610 of the *Gardeners' Chronicle*, in reference to the Cup class for forty-eight blooms. I am one of the persons referred to by your reporter, who considered that the judges made a serious error in their award of the 1st prize at this show. I thought that they did not attach sufficient importance to the Japanese blooms of the 2nd prize stand, which were so very much superior to those of the same section in the stand which they placed 1st. I will admit that the front and middle row flowers of the stands of incurved varieties which were placed 2nd were not equal to the similar rows of the 1st prize stand; but the fact is beyond dispute that the blooms in the back row of incurved flowers in Mr. Molyneux's stand were certainly superior to those of the back row in Mr. Flight's stand; this and the superiority of the Japanese, certainly outweighed the defects of the two rows of incurved named, and entitled Mr. Molyneux, in my opinion, to 1st honours. *E. Wills, Bassett, Southampton.* [We accepted our reporter's comments in good faith, and believe that he only stated what he considered to be true of these stands. *En.*]

**HERBACEOUS BORDERS.**—I am much obliged to your correspondent, Mr. E. Jenkins, for his criticism on my notes (p. 510), as he gives me an opportunity of stating what cannot very well be put into brief Calendarial notes without incurring the risk of erasure by the editorial pen, viz., that statements contained in a Calendar of operations ought to be of such a character as will be applicable to most parts of the British Isles, and should contain instructions that may be followed in garden both large and small. With that object in view my previous notes were written, and I still adhere to what is stated therein. That Mr. Jenkins should take exception to advice on a certain point, and at the same time advocate a precisely similar practice, only in a much more aggravated form, appears to me inexplicable and very inconsistent. One point of contention is, that I advise *Aquilegia corulea* and *Aster dumosus*—plants from 12 to 15 inches high—as companion plants in the same row with others that grow from 3 to 3½ feet, such as *Anemone japonica*, *Aquilegia chrysantha*, and *Asphodelus luteus*. We have in the above a difference in the two extremes of 2½ feet. How does the matter stand in your correspondent's case?—as follows. He writes:—"Another row may be planted with *Galega officinalis* and *G. alba*, *Pyrethrum uliginosum*, *Iris sibirica*, &c." The difference in height of the two last species is from 3 to 4 feet, sometimes more, for whereas *I. sibirica* only attains a height of about 2 feet, *P. uliginosum* will in some localities

grow 6 feet. He gives a very excellent list certainly, but one which I myself would not recommend for beginners, as the result would probably be a certain amount of disappointment, besides money thrown away. It is much better to commence to grow hardy perennials with those of easy culture, and which will grow almost anywhere, but I fear that this much cannot be said of some of the species mentioned in Mr. Jenkins' list. Space will only admit of my giving one instance, viz., *Onosma taurica*. Now, this plant, when grown well, is certainly a gem, but it is a "miffy" subject, and will not grow everywhere; in fact, it is quite unsuited for growing in the open in many parts of England, and even in such a favoured part as South Wilts it requires a cold frame for its home during the winter. Mr. Jenkins states that *Veratrum* are only fit for a botanical garden, and thereby implies that they are unsuitable for private gardens. Will he kindly explain why? I will merely say that a plant of *V. nigrum* when in flower in the gardens here some time ago—7–8 feet high—was as much admired by all who saw it as any other plant in our collection. I rather incline to the opinion that your correspondent is under a misapprehension regarding some of the above-named species. *J. Horsfield.*

**IPOMEEA CERULEA** is one of the prettiest creepers grown, and certainly not so often met with as it deserves to be. It is very easily grown, thriving well in any warm house. At the present time a plant of this species is flowering very profusely on the roof of the conservatory at Greenlands, Berkshire, and the effect is very pleasing, viewed in contrast to the frosted glass of the roof. Being an annual it can be had in flower at different seasons by varying the time of sowing the seed. I know no flower, creeper or otherwise, that has such a pleasing blue colour. What a beautiful companion plant for *Clerodendron Balfourianum*, or one of the yellow *Allamandas*. *T. F. D., Valentines.*

**ZINNIA HAAGEANA.**—Seed catalogues will soon be in our hands, and in marking off the list of annuals wanted for the coming year, this zinnia by no means be omitted, that is, where Zinnias are appreciated. It is very suitable for beds or borders, and some we remember to have seen planted last season in the border, were very attractive. It grows from 12 to 18 inches in height, the leaves are smaller and quite distinct from *Z. elegans*, and again it is much more compact. The ray florets are bordered with a band of bright yellow, the inner portion being of a much darker hue. *W. Harrow.*

## SOCIETIES.

### NATIONAL CHRYSANTHEMUM.

DECEMBER 5.—A meeting of the Floral Committee of the above took place at the Royal Aquarium on this date, there being a large attendance of members, and a goodly number of flowers being staged. Messrs. James Carter & Co., Holborn, sent Japanese Holborn Nugget, golden-yellow, good in colour, but wanting in substance. Mr. C. Harman Payne exhibited, for Mr. Ghys, a French amateur, a large *Anemone*-flowered variety named *Triomphe d'Anzin*, of a pale deep blue colour, the ray florets quilled. As one flower only was shown, it could not be dealt with, and a vote of thanks was passed. Mr. Mursell, Tower House Gardens, Streatham, had Japanese W. G. Drover, which is said to be the same as Frank Thompson, from Mr. E. Beckett, The Gardens, Elstree Park, came a Japanese variety named Mr. W. A. Harris, delicate blush, regarded as a great improvement upon *Hiver Fleur*; awarded a First-class Certificate of Merit; and a bright pale pink variety named Madame Dumas, large in size, but wanting in substance. This exhibitor also had Charles Sharman, purplish-rose, commended for its colour; and Pelican, a large white Japanese some very fine blooms being shown; it is a variety difficult to get, not being a good grower. A vote of thanks was unanimously passed. Messrs. Veitch & Sons, Chelsea, sent a late-flowering Japanese named J. H. Mann, delicate blush, a reflexed variety, with very broad petals. From Mr. Russel, Harfield, Sussex, came a yellow sport from the incurved Princess of Wales, named Mr. Coleman, but the flowers were too old: the committee wishes to see it again next year. From Messrs. J.

Laing & Co., Forest Hill, and Messrs. Henry Cannell & Son, came Japanese Etoile de Lyon, bright soft pink, a very fine flower with broad petals, and quite distinct: a First-class Certificate of Merit was awarded. Mr. R. Owen, nurseryman, Maidenhead, had blooms of some American varieties from plants received in July last—J. Collins, salmon, being new in colour; a vote of thanks was awarded. Also a dull deep pink sport from the white Japanese, Mrs. Carey, named Lily Owen, which was not in good character. Mr. H. Elliott, Springfield Nursery, Jersey, sent some new varieties of his own raising, and a First-class Certificate was awarded to a large Anemone-flowered Caesar, pale rosy-pink guard petals, with a citran-coloured centre, very distinct. A yellow reflexed variety named Jersey Nugget, is identical with sample of Solomon. Messrs. H. Cannell & Son had incurred Perle Precieuse, pale rosy-pink with a silvery reverse; and a large-flowered Anemone named Ruche Toulousienne, not in good character; also a sport from Hero of Stoke Newington (incurred) named Lady Dorothy, which while promising, was not in good form. A First-class Certificate of Merit was awarded to Messrs. H. Cannell & Sons, for Chinese Primrose Cannell's Pink, large, clear, delicate cerise-pink;—a finely formed flower of large size and great beauty. Beauty of Kent, striped; and Bridesmaid, delicate blush-pink, were very fine also.

## SCOTLAND.

### SCOTTISH HORTICULTURAL ASSOCIATION.

THE ordinary monthly meeting was held on the 4th inst, at 5, St. Andrew Square, Edinburgh, Mr. M. Dunn, Dalkeith, in the chair. After the usual preliminary business, a paper on the "Culture of Asparagus" was read by Mr. Porter, gardener, Lenchie, in which he contended that light soil, liberally enriched, was necessary to success. The French system of growing Asparagus was, he thought, good, and his own did not differ much from it. Asparagus culture was declining in England, and the French were beating us, as imported Asparagus could be supplied cheaper. From a calculation he had made, he believed that £126 per acre could be made by Asparagus culture.

Among exhibits there were Orchid blooms from Dr. Paterson, Bridge of Allan; Cattleya Gaskelliana, which, with growing experience of it, Dr. Paterson is disposed to think is the old single sheathed autumn flowering variety of *C. labiata*, and he has some of the forms finer even than the old double sheathed form. *Cymbidium giganteum* was a fine exhibit from the same—a fine spike and a splendid variety. Dr. Paterson also sent some good samples of Tea Roses, as showing the mildness of the season at Bridge of Allan.

Messrs. Laird & Sons tabbed thirty-six blooms of *Chrysanthemums*, Japanese and incurred.

Messrs. Munro & Ferguson exhibited a stand of cut flowers in large bunches of tender and hardy border flowers, as showing the mildness of the season at Piers Hill, near Edinburgh, where their nursery is situated. The stand contained very presentable samples of *Prunella grandiflora*, double and single *Primroses*, *Carnations*, *Helleborus niger* *augustifolia*, *H. olympicus albus*, *Veronica rupestris*, *Dahlias*, *Chrysanthemums*, *Daisies*, *Roses*, *Tradescantia virginica*, *East Lothian Stocks*, *Hepatica angulosa*, *Wallflower*, *Anemone japonica*, *Antirrhinums*, *Pentstemons*, *Sweet Peas*, *Centaurea Cyanus*, *Marguerites*, *Mignonette*, *Helianthus multiflorus*, *Centaurea montana alba*, *Geum coccineum plenum*, *Scabiosa caucasica*, *Chrysanthemum segetum*, *Pink*, and *French Marigolds*.

Mr. Fairgreive exhibited his patent fruit tree protector.

Mr. Dunn, Dalkeith, had some seedling Japanese *Chrysanthemums*, raised from seeds received from New York, sown in March last; the plants were in 5-inch pots, about 2 feet high, with several stems bearing blooms of from 4 to 7 inches in diameter, in various colours, which suggested to *Chrysanthemum* growers present fresh possibilities in the culture of this popular flower.

## THE CULTIVATION OF USEFUL PLANTS IN HAINAN.

A VERY interesting report on agriculture in Hainan (China) during the year 1887 has recently been issued from the Foreign Office. The report deals in detail with the principal articles of culture, especially food plants, and is of a most practical and useful nature. Naturally it commences with a consideration of Rice, which is described as being grown in low muddy ground near water, so that the fields can be watered if the rainfall is insufficient. The weeds and stubble of the last crop are ploughed up, and when, after about ten days, these are rotted away, the fields are watered either by rain or by hand. After being made smooth the young plants are planted out. Three months after planting the Rice blossoms, and in four months it is fit for cutting. The mode of sowing is as follows:—"The grain is soaked for several days, and then sown in the finest soil. The first crop is ready for planting out in twenty days, and the second in about a month, when the shoots are dug out with a trowel, a handful at a time together with the earth, and planted in the fields about 9 inches apart. In the second crop the shoots, which are allowed to grow much longer than in the first, are cut off at the top when planted out." The fields are very freely manured just before the blossoming period, and thoroughly irrigated. "Threshing is done in the fields. A large tub is taken, with an instrument like a ladder of four rungs inside it, against which the grain is beaten, being taken up in bundles with both hands and threshed against it. Another plan is to take the paddy into the village and beat it out with flails. About 80 lb. of Rice grain is used for sowing 1 acre, and this yields, on an average, about 4000 lb. on the first crop, and 5000 lb. on the second. In the most favourable years as much as 8000 lb. per acre has been harvested, but this is the limit. In bad years, again, the yield may be next to nothing."

### SESAMUM (SESAMUM INDICUM).

This plant is grown best on high dry ground—excess of moisture is very detrimental to it. It does not require watering—the dew alone is sufficient to nourish it. In making the beds, therefore, the centres should be higher than the sides, so that the water may run off. In the first month of every year it is sown broadcast, not in lines, nor does it matter whether thickly or sparingly sown. In about ten days it begins to shoot, and in two and a half months it blooms, and at the expiration of another two and a half months it is ready for harvesting. The entire plants, roots and all, are carefully taken out of the ground, put on a cement floor, and threshed with a flail. Two kinds are known—one with black, and the other with white seeds. Sesamum does not generally require manure, but in the poorest soils ashes and ox-manure may be used.

### GROUND NUTS (ARACHIS HYPOGÆA).

This plant is best grown in a soil of coarse sand and mud. They should be set deep, and the ground pressed down firmly over them. The ground is ploughed about April, and trenches dug about 10 inches apart, into which ashes, lime, and rubbish, are thrown. The seeds are sown about 10 inches apart, and, as each is put in, the sides of the trench are turned over it with the foot, and stamped down firm. About every ten days the ground is weeded, and in about two months the plants are sufficiently grown to be sprinkled with liquid manure. In four months they come into flower; the flower-stalk then bends over, and as the flower falls off, the flower-stalk buries itself in the ground, and produces the pods, which ripen about the end of October, bearing the well-known seeds known as Ground-nuts. The harvest, however, takes place at a later date, when the seeds yield more oil, and a better price can be obtained for it. Ground-nuts are harvested by ploughing them up with an ox-plough, when the stalks and seeds clinging to the plough are gathered

into heaps. For the remainder which are still left in the ground, two men lift the earth with a large Bamboo sieve. The pods are perfectly dried in the sun until the thin skin which covers the seed can be broken by rubbing, when they can be stored. Great care has to be taken to thoroughly dry the seeds to prevent their germination, in which case they are useless. The residue of the seeds after the expression of the oil is made into cakes, which are used for manuring the land.

### COCOA-NUT (COCOS NUCCIFERA).

The Cocoa-nut does best near salt water. The ground is ploughed up and the weeds removed, and Cocoa-nuts which have already sprouted are put in several feet apart. Salt is put in with them, but no manure. They bear fruit after ten years. If they do not flourish salt is again put to the roots. For the first few years after planting sweet Potatoes are sown on the ground, but when the trees grow tall and the foliage shades the ground, this cultivation is given up, and cattle are turned out to feed on the ground. Each tree bears from seventy to eighty nuts per annum.

### INDIGO.

This plant, it is stated, can be grown on the hill-sides and in the poorest soil. It does not appear, however, whether the plant referred to is *Indigofera* or *Polygonum*, from which some of the Chinese indigo is prepared. About July or August the plants attain a height of 2 feet, when they are taken up, root and all, and put into the vat, and soaked together with stone lime. This is stirred several times a day, and in ten days it is drawn off as liquid indigo. J. R. J.

## LAW NOTES.

## ACTION FOR SEEDS.

In the City of London Court on Wednesday, Nov. 5, before Mr. Eardley Wilmot, sitting as Deputy Judge for Mr. Commissioner Kerr, an action was brought by Mr. Thomas Clark, seed merchant, of 10, Mincing Lane, E.C., to recover payment of an account for seeds supplied to the defendants, Messrs. Frischkauer & Co., Limited, seed merchants, of 100, Fenchurch Street, E.C. The plaintiffs, it appeared, sold 100 bags of seed to the defendants, for which they now refused to pay. The defence was that when the seed was bought a sample of it was given to the defendants, but that the bulk was very inferior to the sample. They had paid £60 on account of the seeds before they took delivery of them.

The learned Deputy Judge said if they were not according to sample the defendants should have refused the seeds. The defendants said as soon as they got the sample and compared it with the bulk, they asked for an allowance. They were also willing to go to arbitration, but the plaintiff told them they were not entitled to any consideration, whether the bulk was equal to the sample or not. The seed was still in their wharf awaiting the trial of this case; and even now they would go to arbitration. The learned Deputy Judge found for the plaintiff, and said if the defendants did not like the bulk they should not have kept it—they should have sent it back. Judgment was entered for £4 18s. 5d. for the plaintiff, less £1 2s., paid into Court; and costs were allowed.

## THE WEATHER.

## THE PAST WEEK.

The following summary record of the weather for the week ending Dec. 3, is furnished from the Meteorological Office :—  
 "The weather has remained in a dull, rough, and unsettled condition very generally, with a good deal of rain over England and Ireland, and falls of snow, sleet, and rain over Scotland. Thunder and lightning were experienced during the earlier part of the period in almost all districts.

"The temperature has been rather less than was during last week, but in all districts excepting 'Scotland, N.' it has still been above the mean. Over the greater part of England an excess of 3° or 4° is shown, and in 'England, S.' 5°. The highest of the maxima were generally recorded either on December 2 or 3, when they varied from 55° in 'Scotland, N.', and 'England, E.' to 58° in 'Scotland, E.', and 'Scotland, W.', and to 60° in 'England, N.W.', and 'Ireland, S.' The lowest of the minima, which were registered during the earlier part of the period, ranged from 21° to 28° in Scotland, from 23° to 25° over Ireland, and from 25° to 32° over England.

"The rainfall has been rather less than the mean in 'Scotland, N.' but more in all other parts of the kingdom; in the east and west of Scotland, the south-west of England, and the south of Ireland, the excess has been large.

"Bright sunshine has continued very deficient generally. In the 'Channel Islands' the percentage of the possible amount of duration has been 33; over England it has ranged from 9 to 20, in Scotland from 6 to 14, and in Ireland from 5 to 6."

[Accumulated temperature indicates the combined amount and duration of the excess or defect of temperature above or below 32° F. for the period named, and is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

## MARKETS.

## COVENT GARDEN, December 6.

[We cannot accept any editorial responsibility for the subjoined reports, which, however, are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations represent averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and they fluctuate, not only from day to day, but often several times in one day, and therefore the prices quoted as averages for the past week must not be taken as indicating the particular prices at any particular date, and still less can they be taken as guides to the prices in the coming week. Ed.]

Heavy supplies of Apples to hand; prices easier. Grapes cleared more readily. James Webber, Wholesale Apple Market.

## FRUIT.—AVERAGE WHOLESALE PRICES.

## SEEDS.

LONDON, Dec. 5.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, E.C., write that to-day's market, as might be expected, was very thinly attended, and the business doing was in the smallest possible compass. All descriptions of Clover seed are just now exceedingly quiet, and, indeed, no great activity is looked for until the New Year. Meantime, quotations all round keep steady. Canary and Hemp seed are now good in quality and low in price. For Peas and Haricots the demand is slow on former terms. There is no change in either Mustard or Rape seed. In Linseed the tendency is downwards.

## CORN.

Averages.—Official statement showing the average price of British corn, imperial measure, in the week ended December 1.—Wheat, 31s. 8d.; Barley, 27s. 4d.; Oats, 16s. 9d. For the corresponding week in 1887.—Wheat, 31s. 3d.; Barley, 25s. 3d.; Oats, 16s. 1d.

## FRUIT AND VEGETABLES.

SPITALFIELDS, Dec. 5.—Good supplies of all kinds of fresh vegetables, Potatoes, &c. Trade very slow indeed, hence low prices. Large arrivals of American Apples. Quotations as under:—Pears, 3s. to 6s. per bushel; English Apples, 2s. 6d. to 6s. do.; do., 1s. 3d. to 3s. per half-bushel; American do., 10s. 6d. to 21s. per barrel; Cauliflowers, 3s. 6d. to 7s. per tally; Savoys, 1s. 9d. to 2s. 6d. do.; Spinach, 1s. 6d. to 1s. 9d. per bushel; Brussels Sprouts, 1s. to 1s. 3d. per half-sieve; Saakale, 1s. 3d. to 1s. 9d. per punnet; Parsnips, 6d. to 9d. per score; Greens, 1s. to 1s. 6d. per dozen bunches; Turnips, 1s. 6d. to 2s. do.; Carrots, 1s. 3d. to 1s. 9d. do.; Horse-radish, 11d. to 1s. 2d. per bundle; Celery, 8s. to 12s. per dozen bundles; English Onions, 5s. to 5s. 6d. per cwt.; Belgian do., 3s. to 3s. 3d. per bag; Dutch do., 3s. 3d. to 3s. 9d. do.; pickling do., 4s. 6d. to 5s. 9d. do.; Endive, 1s. 6d. to 2s. 6d. per dozen; Carrots, 2s. to 30s. per ton; Parsley, 1s. 6d. to 2s. per dozen bunches; Cabbages, 1s. 6d. to 2s. 6d. per tally.

STRAFORD, Dec. 4.—Both trade and supply have been good during the past week.—Cabbages, 2s. to 3d. per tally; Savoys, 2s. to 2s. 6d. do.; Cauliflowers, 1s. to 1s. 6d. do.; Turnips, 2s. 6d. to 3s. 6d. per dozen bunches; do., 25s. to 30s. per ton; Carrots, household, 25s. to 30s. do.; do., cattle feeding, 20s. to 24s. do.

Mangels, 16s. to 18s. do.; Swedes, 17s. to 20s. do.; Apples, English, 2s. 6d. to 6s. per bushel; Watercress, 6d. per dozen; Beetroot, 6d. to 1s. per dozen; Celery, 8d. to 1s. per roll; Sprouts, 1s. to 1s. 3d. per half-sieve; Horseradish, 1s. to 1s. 2d. per bundle; Walnuts, 3s. 6d. to 4s. per bag; Pears, 3s. to 4s. per bushel; Sage, 1s. 6d. per dozen bunches; Thyme, 1s. 6d. do.

### POTATOS.

**BOROUGH AND SPITALFIELDS.** Dec. 4.—Although fresh arrivals have not been heavy, London stocks have rather accumulated from lack of demand, and cause a dull trade; prices are rather easier, except for best samples. Quotations.—Regents, Scotch, 85s. to 115s.; English, 60s. to 80s.; Hebrons, 65s. to 110s.; Magnum Bonums, 60s. to 100s. per ton.

**SPITALFIELDS.** Dec. 5.—Quotations.—Beauty of Hebron, 90s. to 100s.; Magnums, 65s. to 85s.; Imperators, 75s. to 85s.; Champions, 60s. to 65s.; Regents, 85s. to 100s. per ton.

**STRATFORD.** Dec. 4.—Quotations.—Light soil 65s. to 85s.; dark do., 65s. to 75s.; White Elephants, 70s. to 90s.; Beauty of Hebron, 60s. to 75s. per ton.

### HAY.

*Averages.*—The following are the averages of the prices obtained at the various metropolitan markets during the past week:—Clover, old, prime, 120s. to 147s.; new, 80s. to 110s.; inferior, 30s. to 54s.; prime meadow hay, 120s. to 130s.; good new hay, 80s. to 100s.; inferior, 30s. to 70s.; old straw, 40s. to 48s.; new, 28s. to 44s. per load.

## NOTICES TO CORRESPONDENTS.

INTELLIGENT READERS, DO PLEASE NOTE that letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the PUBLISHER, and that all communications intended for publication, as well as specimens and plants for naming, should be addressed to the EDITOR. Such communications should be written on one side only of the paper, and sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

**GALLS ON ORCHID ROOTS:** *Thos. Denny.* The insect which causes these galls is *Isosoma orchidarium*. We do not know of any remedy. You might try some sticky compound that will keep moist spread on pieces of cardboard or paper. The other question next week.

**GARDENIAS:** *H. B. M.* Your plants are attacked by the root-worms illustrated in our issue for April 9, 1887, p. 489. You had better burn the plants and the soil in which they are growing.

**LAWN SLOPE:** *Gardener.* Do not make a regular slope, it is both unnatural and ugly. See our issue for November 24 last; there are three examples of good slopes applicable to your case. A terrace is but an ungainly way of getting over the difficulty, and they are, moreover, expensive to make and to keep in order, and dwarf the height of the mansion when looked at from any point below.

**LILUM AURATUM:** *C. B. R.* Roots dug up in August, before being thoroughly ripened, are not likely to keep well through the winter, and still less so if they are stored in the open, in sand, under straw and hurdles. In a very mild winter no harm might arise.

**LUPINS:** *R. V. & S.* The dwarf pale pink Lupin sent is a very prettily coloured one, but the pieces sent give no idea of the appearance of the plant.

**MEALY-BUG ON VINES:** *J. H. W.* There are many recipes, some gardeners pin their faith on petroleum emulsion, petroleum diluted with water, Gishurst compound, and coal tar. Whitever is used most, with the exception of the first-named, be largely diluted with some innocent medium, as clay, cow-dung, soot, and with nothing of a viscid nature, otherwise injury would be done. After rubbing off the loose bark with the hand, say, petroleum emulsion may be used; this must be rubbed with a soft brush into every part, especially the crevices about old spurs. Then should follow washing the walls and woodwork with hot-water and petroleum, at the rate of half a pint to 2 gallons of the former. Lime-washing should succeed the washing of the walls; and painting

the woodwork might also be done, if it is getting worn off, or the attack of bug be severe. The soil of the borders should be taken away to the depth of 4 inches and renewed with fresh compost. Washing the Vines with emulsion, cleaning the walls, &c., and renewing the surface soil, supplemented by a sharp outlook for the insect during the period of growth will have to be followed up for several years in succession.

**NAMES OF PLANTS:** *Able Fairall.* *Origanum* Dictamnus.—*A. R. 1.* *Croton pictum*; 2, *Dendrobium Pierardi*; 3, *Epidendrum cochleatum*; 4, *Cypripedium venustum*; 5, *Croton variegatum*; 6, *C. undulatum*.—*W. X. 1.* *Thomasia salomanae*; 2, *Fittospermum undulatum*; 3, *Dacrydium cupressinum*; 4, *Michaella (Magnolia) fuscata*; 5, *Seme (Ruscus) atrovirens*.—*J. S. 1.* *Gongora galeata*; 2, *Acacia dealbata*; 3, *Begonia nitida alba*; 4, *Adiantum excisum*; 5, *Adiantum nidulatum*; 6, *Adiantum Capillus-veneris* var., may be *A. Mariessii*.—*H. C.* *Odontoglossum Inseleyi*.—*W. F. C. 1.* *Picea Nordmanniana*; 2, *Pinus excelsa*; 3, *Abies pinsapo*; 4, *Cedrus atlantica*.

**ORCHIDS:** *J. P.* *Cœlogyne cristata* will grow best in a cool-house, although, during the flowering period, a warm-house is best for it. Potting and dividing the pseudobulbs is best done in early summer.

The resting time is after flowering. As the plant is evergreen it must not be kept totally dry at the root when at rest. They grow best in well-drained pots. *Thunias*: the old stems of these plants may be cut up like a *Diefenbachia* and propagated; this is best done when growth is completed. Pot the plants just before growth commences, using coarse peat and sphagnum in equal parts, and well drained pots—no bottom-heat. Newly imported *Cypripediums*, after cleaning them and cutting away all damaged parts, may be potted into fresh crocks and charcoal, and kept moist in a shady house until roots appear, when they may be repotted in the usual way.

**ROMNEYA COULTERI:** *T. G. C.* It is a half-hardy perennial, and does best in a frame or in the greenhouse. It may be raised from seeds sown in the spring.

**SEEDS OF ARGEM. XTHIOPICUM:** *J. M.* The production of seed is not rare. They have small commercial value. It would take from two to three years to get a flowering plant from seed.

**TO SKELETONISE LEAVES:** *E. Longley.* Take 6 oz. of washing soda, and put into 2 quarts of boiling water. Slack 3 oz. of quicklime, and add to the other. Boil the whole for 15 minutes. Let it settle, and then pour off the clear fluid. Put this on the fire and boil; while boiling put in the leaves, and boil for one hour or so. Take out a leaf, and if the epidermis comes away easily when rubbed by the finger and thumb (under clean water), the leaves are ready. After the epidermis is removed, put the skeletons into a solution of a wineglassful of chloride of lime to a quart of water, in order to bleach them; some will be finished in about 10 minutes, others about an hour; when white, throw them into pure water to clean out the bleach, and float out on to slips of paper. The best leaves to commence with are Holly, Poplar, Ivy, Laurel, &c., and should have no signs of decay in them.

**WINTER MOTH (CHEMATOBIA BRUMATA):** *G. P. C.* The smear you have used is very efficacious, for the piece sent is covered with the males and the almost wingless female. As prevention is better than cure, we advise all gardeners to place a broad band of rag or paper smeared with boiled train-oil, bird-lime, size, or cold coal-tar, round their Apple tree stems during this month, when many of these insignificant but very destructive insects will be caught. It is best, when the trapping of the moth is begun early in November, renewing the smear as often as it hardens.

## THE THAMES BANK IRON COMPANY

(Telegraphic Address—"HOT-WATER, LONDON." Telephone—No. 4,73)

Have now pleasure in bringing to the notice of Horticulturists and Gardeners generally their  
**NEW PATENT (No. 9090, 1888) HORIZONTAL TUBULAR BOILER,**  
Which is, without doubt, the Best All-round Boiler in the Market.

It combines all the advantages of its class so well known, and by the improved method of forming the joints—viz., with India-rubber Washers, the old and too often inefficient way of caulking the joints is entirely dispensed with.

SECTION OF PATENT JOINT

It can be erected in a few hours, and may be relied upon as a thoroughly sound and good Hot-water Generator. It has been carefully tested in every possible way, more especially with regard to power and durability, and the result has been highly satisfactory.

THE LARGEST AND MOST COMPLETE STOCK OF

## HOT-WATER BOILERS OF EVERY DESCRIPTION

PIPES, CONNECTIONS, VALVES, VENTILATING GEAR, &c.

New York, U.S.A.

**Estate Sales.**  
The best County medium for Advertising Sales of  
Estates is  
**THE WORCESTER HERALD,** the largest  
and leading County paper. Extensive circulation among  
the upper and middle classes in the Forests and adjoining  
counties. Advertisers would do well to forward for reference  
and distribution, plans and particulars of Estates, Catalogues  
of Machinery, Furniture, Books, and other property advertised  
in the columns of the *Worcester Herald*. Specimen copies sent  
free. Published Friday for Saturday, Price 2d.  
Offices, 72, High Street, Worcester.

**Sales of Stock and Agricultural Effects.**  
**THE WORCESTER HERALD** is the most  
effective organ for giving publicity to announcements of  
this class. It is the largest and leading Agricultural paper in  
the county, and circulates most extensively among Agricultur-  
ists and around Worcester. Specimen copies sent  
free. Published Friday for Saturday, Price 2d.  
Offices, 72, High Street, Worcester.

**Farms to be Let.**  
LAND AGENTS, ESTATE MANAGERS, and all having Farms  
to Let, would do well to advertise in  
**THE WORCESTER HERALD,** the Largest  
and Leading County Paper. Specially adapted for  
bringing such notices before Tenant Farmers. Large Circula-  
tion, moderate charge. Specimen free. Price 2d. Published  
Friday for Saturday.

Offices, 72, High Street, Worcester.

## THE HORTICULTURAL DIRECTORY

This, which is the oldest and most reliable work of the  
kind hitherto published, has enjoyed throughout a period of  
thirty years a reputation for correctness, comprehensiveness,  
and a facility of reference unequalled by any similar publica-  
tion. It is arranged in thirteen sections, and consists of—  
London Seedsmen and Florists, Nurserymen, Seedsmen,  
and Florists residing within the Postal Districts of the Metro-  
polis. County Lists of the Nurserymen, Seedsmen, and Florists  
in England and Wales. Ditto, ditto in Scotland. Ditto, ditto  
in Ireland. Ditto, ditto in the Channel Islands. Alphabetical  
Lists of the Nurserymen, Seedsmen, and Florists in Great  
Britain and Ireland. County Lists of the Seats of the Nobility  
and Gentry in Great Britain and Ireland, their Gardens, and  
the nearest Post Town. Alphabetical List of the Seats in  
Great Britain and Ireland, showing the Counties in which they  
are situated, their Owners, and the nearest Railway Station,  
and distance from the same. Alphabetical List of the Gardeners,  
and their full addresses, in Great Britain and Ireland. List of  
Landscape Gardeners, Garden Architects, and Horticultural  
Builders, and Engineers. List of the Botanical, Horticultural,  
and Floral Societies in Great Britain and Ireland, with the  
Names and Addresses of their Secretaries, indicating those that  
are in alliance with the Royal Horticultural Society. Nursery-  
men, Seedsmen, and Florists in the United States of America, and  
the Colonies. Certificates awarded by the Royal Horticultural  
Society from November, 1887, to November, 1888.

**SPECIAL NOTICE.**—The Publisher, in calling attention to  
this *ORTICULTURAL DIRECTORY*, published in the year 1888, would  
specially refer to the Great Improvement that is made in this  
issue by the introduction of many useful and attractive  
features.

Office: 171, Fleet Street, London, E.C.

de FLORICULTURE, et de CULTURE MARA-  
CHERE. A monthly horticultural paper, with superb Coloured  
Plates and Illustrations. Published since 1865, by F. BURY-  
NICH, F. PAYNAERT, E. RODIGAS, and H. J. VAN HULLE,  
Professors at the Horticultural School of the Belgian Govern-  
ment at Ghent. Post-paid, 10s. per annum.  
H. J. VAN HULLE, Botanical Gardens, Ghent, Belgium.

**WANTED, by a Gentleman in Surrey, near**  
London, a HEAD WORKING GARDENER, married,  
with competent knowledge of Vines, Peaches, Greenhouses,  
Fruit Trees, and Kitchen Garden. Must have had practical  
experience of Haymaking and the Management of Cows and  
Pigs. An excellent cottage on the property. Under Gardener  
and Stockman kept. No objection to one who has not yet been  
Head Gardener.—Apply, in own handwriting, stating age,  
wages, &c., and copies to last of the *Worcester Herald*, or to  
*Worcester Herald* Office, 41, Wellington Street, Strand, W.C.

**WANTED, IMMEDIATELY, a GAR-**  
DENER and WIFE, for Rosario, Argentine Republic;  
without family. Age and salary to apply personally on Monday,  
2 to 4, to Senor MAZZA, Royal Hotel, Blackfriars, E.C.

**WANTED, a GARDENER, for a Small**  
Single-handed place near London. Must be thoroughly  
competent in all branches, and a smart tidy man. Preference  
given to a married man without family. Rooms, coal, and gas  
found.—Address, stating wages required, W. M., Messrs.  
Street, 30, Cornhill, E.C.

**WANTED, a SINGLE-HANDED GAR-**  
DENER, married without children. Two rooms on  
premises.—Apply by letter to last of the *Worcester Herald*, or to  
J. A. B. Finsbury Circus, E.C.

**WANTED, a SECOND GARDENER, single,**  
well acquainted with all kinds of Fruit and Garden Plants,  
Ferns and Orchids.—FASSY BLAKE, Crook House,  
Kidderminster.

**WANTED, married Man, as SECOND GARDENER,** to do Stone and Greenhouse, and to assist at General Work. Wages, 15s. 6d.—Mr. LUCAS, Beecham House, Reading.

#### To the Cape at once.

**WANTED, a good General PROPAGATOR.** In and Out-door man. He will be a good opening for a good steady working man.—50, Everleigh Road, Shaftesbury Estate, Wandsworth, S.W.

**WANTED, AT ONCE, a WORKING PROPAGATOR and GROWER of Cut Flowers.**—P. J. PERRY, The Nursery, Banbury.

**WANTED, a good PLANT GROWER and SALESMAN for the Indoor Department;** a married man. Applications to state age and wages expected to FISHES, SON, and SIBRAY, Handworth Nurseries, Sheffield.

**WANTED, a CLERK, in the Nursery.** Wages 22s., to increase.—THOMAS HEWITT and CO., Solihull.

**WANTED, a JUNIOR SHOPMAN.** Must have a thorough knowledge of Seeds and Bulbs, and accustomed to smart General Trade.—State where experienced, gain, salary, &c.—THOMSON, 20, High Street, Birmingham.

**WANTED, as DECORATOR for a West End Florist, a young Man with a little experience.** Good wages will be given.—W. M., 20, South Audley Street, Grosvenor Square, W.

#### GARDENING APPOINTMENTS.

MR. WILLIAM SPINKS, for many years manager of MESSRS. HANS NIEMAND'S nurseries, Edgbaston, has been appointed manager of THOMAS HEWITT & Co.'s Nurseries, Solihull.

MR. JAMES SMART, late Fruit Foreman to his Grace the Duke of PORTLAND, Welbeck Abbey, Worksop, Notts, has been appointed Head Gardener to Sir RALPH PAYNE GALLWEY, Thirkley Park, Thirsk.

#### WANT PLACES.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

**NOTICE TO ADVERTISERS.**—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything bearing the postmark on envelope by which to identify the sender; in all such cases a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisement which they wish repeated.

**POSTAL ORDERS.**—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filed in the column headed "PAID BY," to W. RICHARDS, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person to whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

**RICHARD SMITH AND CO.** beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

**GARDENER (HEAD).**—Age 29, married; fifteen years' practical experience; four and a half years' good character from last place.—C. BECKENHAM, 2, Bedford Cottages, Hinton Road, South Beddington, Surrey.

**GARDENER (HEAD).**—Mr. POPE will have pleasure in recommending his Head Gardener to any Lady or Gentleman requiring an experienced man in all branches of Gardening.—Westfield, Burchmore, Isle of Wight.

**GARDENER (HEAD);** age 35, married.—JOHN F. RAGGETT, late Head Gardener to Lord Hyton, is at liberty to engage with anyone requiring a thorough practical man up in all branches. Teetotaler.—Address, F. J. K., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

**GARDENER (HEAD);** age 32.—The Advertiser has had twenty years' experience in the best Noblemen's and Gentlemen's Gardens in England. For the last five years Foreman at Great Gearys under Mr. Douglas. Highly recommended.—H. YOUNG, Great Gearys, Ilford, Essex.

**GARDENER (HEAD).**—Age 31 in February, married.—W. S. SHOEBRIDGE, Esq., Albion Hall, Ware, Herts, will be pleased to recommend his Head Gardener, A. Brooks, to any Lady or Gentleman requiring a thorough practical man indoors and out, who has been with him four years; leaving without fault. Sixteen years' experience.

**GARDENER (HEAD WORKING).**—Age 30, married, one daughter (age 13); twenty-four years' experience. Good all-round references and testimonials.—C. C., 84, St. John's Road, Upper Holloway, N.

**GARDENER (HEAD WORKING).**—No family; has had a great deal of experience in all branches of Gardening. Good character from last and present employer.—WILLIAM THOMSON, Finchley Hall, Wellingtonborough.

**GARDENER (HEAD WORKING).**—ALFRED KEMMER, Debsborough Court, Cork, offers his services as above. Thoroughly acquainted with every branch of Gardening; and first-class references. English and Protestant.

**GARDENER (HEAD WORKING).**—Married; thoroughly experienced in Fruit, Plants, and Vegetables. Can be well recommended from all previous employers.—GARDENER, 4, Doveclade Place, Harrow, N.W.

**GARDENER (HEAD WORKING);** no young family.—A. AXERS DOUGLAS, Esq., M.P., will be pleased to recommend his Gardener to any Lady or Gentleman requiring a thoroughly practical man in all branches.—J. EVANS, Clifton Park, Maidstone.

**GARDENER (HEAD WORKING).**—In the prime of life, single, and an abstainer; trustworthy, energetic, and thoroughly practical in all branches. Five years' high character, also testimonials.—J. H., 39, Tetcot Road, King's Road, Chelsea, S.W.

**GARDENER (HEAD WORKING),** where one or two others are kept.—Age 46, married; thirty years' experience. Understands Vines, Greenhouse, Flower and Kitchen Gardening. Can have twenty years' good character from present employer.—GARDENER, Trafalgar, Salisbury.

**GARDENER (HEAD WORKING).**—Age 29, single, and an abstainer, thoroughly experienced in Early and Late Forcing of Fruits, Flowers, and Vegetables, and the general routine of a good establishment. Good personal character as above.—J. REEVES, 10, Cromwell Road, Tulse Hill, Wels.

**GARDENER (HEAD WORKING),** or good SINGLE-HANDED.—Married, no family; thoroughly experienced in first-class general work.—J. T. B., 9, Maxwell Road, King's Road, Chelsea, S.W.

**GARDENER.**—Single; fifteen years' experience in all-round Gardening has been two years as Head in last place.—G. H., 1, High Street, Highgate, N.

**IMPROVER, in Retail Seed Department.**—Age 19; salary not so much a consideration. Good references.—SEEDSMAN, Messrs. Rutley & Silverlock, Victoria Embankment, London, W.C.

**To Head Gardeners.** COWMAN.—Married; willing to till up time in Garden. Wife good Poultry and Dairywoman. Well up in Rearing Poultry.—J. EDWICK, Wharton Grange, Framling, Sussex.

**ASSISTANT's situation in Florist and Seed Business,** or MAID in Private Gentleman's Establishment, wanted by Gardener's daughter. References given and required.—W. CLARK, Fruit Grower, Hemingford, Hunts.

**TO FLORISTS.**—Wanted, a Situation for an experienced young Girl, in a West End Florist Business. Able to take any branch of the business. Good references.—G. CHAPMAN, 45, Halsey Street, Chelsea, S.W.

**HOLLOWAY'S OINTMENT and PILLS** combine both sanative and snative powers in a high degree; by the former term is understood their ability to preserve health, by the latter their capability to restore health. With these remedies in hand, no invasion need be at fault to guide himself or herself safely through the many trials to which every one is subjected during our long and oftentimes inauspicious winters. Coughs, colds, ulcerated throats, quinsy, whooping cough, can be successfully treated by well rubbing this Ointment upon the chest, and by taking the Pills. During damp, foggy weather, asthmatical sufferers will experience the utmost possible relief from the Ointment, or the Pills, and all tender-hearted persons will save endless misery by adopting this treatment.

## SMITHFIELD IRONWORKS, LEEDS, AND SURREY WORKS, BLACKFRIARS ROAD, LONDON, S.E.,

HORTICULTURAL ENGINEERS to HER MAJESTY THE QUEEN, call Special Attention to their Patent Wrought-Iron Municipal or Angular Chambered and Tubular

### HOT-WATER BOILERS,

And others with SHELVES, and Hollow or Ordinary Cast-iron GRATE BARS.

#### SADDLE BOILERS.

With WATERWAY BACKS and WELDED BOILERS, any of which are specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c. They are the neatest, cheapest, most effective, and durable of any extant.

The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.

These Patterns secured the FIRST and HIGHEST PRIZE—a SILVER MEDAL—at the Royal Horticultural Society's Exhibition, South Kensington, London, June 1, 1881.

#### The Best Boiler Extant.

### TESTIMONIALS.

MESSES. THOS. GREEN AND SON, LTD., NORTH STREET, LEEDS.

Re HEATING APPARATUS. Borough Engineer's Office, Municipal Buildings, Leeds, January 9, 1886.

GENTLEMEN,—I have great pleasure in bearing testimony to the efficiency and satisfactory working of the Hot-water Heating Apparatus you erected in these public buildings.

The buildings are four storeys high, and we have a total length of about 25,000 feet of piping in them, varying in size from 1½ in. to 6 in. diameter, with their connections, &c. The several offices and rooms can all be in operation at one time or separately, and the heat regulated by means of the valves to the temperature required, even in the coldest weather.

Two of your Patent Municipal Boilers, No. 4, work the whole of this piping easily, although we have three of them fixed. They are very powerful and economical in the consumption of fuel, and I am pleased to be able to report of them and the apparatus so favourably.

I am, Gentlemen, yours truly, THOS. HEWSON, Borough Engineer.

Morley House, Bagot, St. Saviour's, Jersey, November 10th, 1886.

GENTLEMEN,—The large Municipal Boiler which you sent me last year is doing its work satisfactorily; it is heating 5,000 feet of 4-inch pipe in one of my vineries, and I am quite sure that it has power to work a much greater length, while in cost of fuel it compares favourably with any other Boilers.

I have now five of your Boilers in use, and I cannot speak too well of their heating powers, or their comparatively small consumption of fuel.

MESSES. THOS GREEN AND SON, LTD., LEEDS. Yours faithfully, (Signed) G. W. BASHFORD.

AND HUNDREDS OF OTHER REFERENCES CAN BE GIVEN IF REQUIRED.

NEW EDITION, CORRECTED UP TO DATE.

## THE Gardeners' Chronicle.

SATURDAY, DECEMBER 15, 1888.

## HAMPTON COURT GARDENS.

**AMONG** the few gardens of medieval England which still remain to us, there are none which can be held to vie in historic and artistic charms with the Queen's palace gardens of Hampton Court. Upon these gardens the skill of many great garden artists has been spent; within the precincts of their walls numerous stirring events have taken place; and the splendours of many successive Courts have been witnessed. We are told by the historian of the palace, Mr. Ernest Law, that it was in these gardens that "Wolsey paced in anxious meditation a few weeks before his fall."

It was in these gardens also that Henry VIII. made love to Anne Boleyn and to Catherine Howard, and George II. to Mrs. Howard and Mary Belkenden. In the Privy Garden we may still walk along the paths on which it was the custom of Queen Elizabeth to take her daily morning walk, or we may sit beneath the bower where Queen Mary sat at needlework with her maids of honour. Nor do the gardens lack literary associations. The Lime trees in the fountain garden have sheltered from the noonday sun Pope and Hervey, Swift and Addison, Walpole and Bolingbroke.

Notwithstanding, however, all these historic associations of the gardens, no writer has ever attempted to chronicle their past. Mr. Ernest Law has, indeed, given us a few notices relating to the gardens in his charming work, *The History of Hampton Court in Tudor Times*; but these notices are far too scanty, and he has by no means exhausted all the documents which refer to the gardens in those times.\* The work, how-

\* Mr. Law has just published a little guide (price 1s.) to the palace, and at the end of this guide is given a short sketch of the history of the gardens. To this little work the author of the present paper is much indebted.

ever, supplies us with references to some of the original accounts relating to the gardens which still exist in the Record Office and elsewhere, and it is by the aid of these that it is proposed, in the following paper, to give, in a detailed form, a history of the palace gardens.

We naturally go back to the time of Wolsey in recalling the original wealth and splendour of the gardens, but we find them noticed at a very much earlier period. In the report of the Prior of the Knights Hospitalers in England to the Grand Master, in the year 1338, there is mentioned as belonging to the order a "camera" or mansion-house, "gardens and a dove-cot" at Hampton. This mansion-house, Mr. Law has shown, with great probability, stood on the site of Wolsey's palace. We hear little further of the gardens until the commencement of the sixteenth century, when we read of the house being still inhabited by the order, that it had gardens, and that it was occasionally visited by members of the royal family and high ecclesiastical functionaries. One of the royal personages who visited the mansion in the early years of the sixteenth century was Elizabeth of York. She came here, history tells us, "to recruit her health," for the air of Hampton, her physicians agreed, was the best air which could be procured within an easy distance of London. On this visit it is probable that she spent much of her time in the gardens, and we may picture to ourselves the Dowager Queen sitting with her maids in the Rose and Honeysuckle-covered arbours (these were common features in the gardens of those days), or resting under the Pear and Apple trees of the orchard.

In the year 1514—the year in which Cardinal Wolsey's tenancy began—the history of the palace really commences. "No sooner," we are told by Mr. Ernest Law, "did that famous ecclesiastic enter into the possession of the place than he began with characteristic energy to plan the erection of a vast and sumptuous edifice, and surround it with gardens and parks, which were to be an appanage in every way worthy of the princely residence he was projecting." The land which Wolsey bought for his palace, gardens, and park consisted of some 2000 acres, and on this land, in the south-west corner, was situated the old manor-house. Immediately around the house he laid out the gardens and orchards (which he separated by brick walls\*), and outside these, to the north-east, he laid out his two great parks. The accounts of expenses incurred for laying out these gardens, which were rendered by Wolsey's head gardener to the clerk of works, are still preserved in the Record Office, but they throw very little light on the plan of the gardens at that time. There are, however, many curious entries for wages of the gardeners employed and for implements used. Some of these entries refer to the shovels, spades, barrows, seeds, and even to the "plants" bought "for the use of my lord's garthing." The head gardener employed was John Chapman—one of the most celebrated gardeners of his time.† The accounts, which were rendered fortnightly, are all signed by him in a very clear hand. This circumstance shows that the gardeners of that time were taken from a superior class. The expenses in 1515 averaged 80s. per fortnight, but this amount was sometimes expanded by the

addition of women to the ordinary staff of labourers, for weeding in the "old garden."

Although these accounts throw but little light on the manner in which the gardens were laid out, we gain a fair idea as to what they were like at this period from the following lines in the metrical life of Wolsey written by Cavendish:—

"My galleries were fayre, both large and longe,  
To walk in them when that it liked me best;  
My gardens sweet enclosed with walles strong,  
Embanked with benches to sit and take my reſte;  
The knottis so enknotted it cannot be expreſsed,  
With arbours and alleys so pleaſant and ſo dulce  
The peſtilent airs with flours to reſpue."

Here we have a description of the style of gardening in vogue in England in the opening years of the sixteenth century—the gardens secured by high walls like those described by Chaucer in the *Romaunt of the Rose*; the grass banks some 3 feet high placed all around the walls on which one might sit and rest; the "knottis" or beds in which plants were laid out in different patterns, somewhat like those in our modern so-called carpet-beds; the arbours† or little summer-houses, and the alleys made of trellis-work over which twined or crept the Vine, Rose, and Honeysuckle, and above all, the sweet-scented flowers, which must have made the gardens of that time and of Elizabeth so delightful. In such a garden, we are informed by his biographer, Cavendish, Wolsey used to walk towards evening, "and read his evensong and other divine service with his chaplain." This old garden of Wolsey was situated to the south of the base-court and probably covered the plot of ground now known as the Pond Garden. An orchard is also mentioned in Wolsey's accounts. This was probably situated on the plot of ground afterwards known as the "Old Orchard," now known as the Wilderness.

Not many years passed before Cardinal Wolsey was banished by Henry VIII. to Esher, and he had to give up the palace and gardens to the king. This was in 1529, and immediately the king gave orders "for enlarging and improving the palace and its surroundings." It was not, however, till 1530 that any large alterations were made in the gardens. In the early part of that year a large number of labourers were employed for "bringing the earth and manure" to the Privy Orchard.‡ A number of orchard trees were then planted, and under them were set "sixteen bushels of Strawberry roots."§ In planting-out the trees little spaces appear to have been left here and there, which were freely open to the sun. In the centre of each of these open spaces was fixed a "brassy sundial" and seven of these are entered in the accounts as having been bought for this purpose of a "clockmaker of Westminster."||

(To be continued.)

## PINUS LARICIO.

So much has been said in these columns of late years respecting the Corsican Pine and its near allies (see especially Dec. 15, 1883, Jan. 5, and Feb. 16, 1884), that it is unnecessary now to do more than refer the reader to them. In the course of these articles mention was made of the fine tree near the Kew Green entrance gateway to the Royal Gardens at Kew. The tree, of which we now give an illustration (fig. 97), forms a conspicuous object from a distance, though, unfortunately, its leader has been destroyed. According to a statement of the late veteran Curator, John Smith (*primus*), in the *Garden*, the tree in question was brought from the South of Europe and planted, in 1814, by Mr. R. A. Salisbury, a noted botanist of his time. In 1825 the tree was 20 feet high, and in 1885 it had attained a height of 88 feet, and was 12 feet in girth at the base. A cone and a shoot are shown on p. 705. The present height of the tree is 91 feet; spread of branches, 60 feet; and stem girth at 4 feet from the ground, 9 feet.

\* Chapter House Accounts, C. 3, f. 695, 811, &c. This mention of the "old garden" shows that Wolsey did not entirely alter the surroundings of the old manor-house.

† In the accounts preserved in the Record Office (C. 3), is the following item relating to the labour of Wolsey: "for twigges to bind the arbours, viid."

## NEW OR NOTEWORTHY PLANTS.

### CATASETUM GARNETTIANUM, Rolfe, n. sp.

This little gem of a *Catasetum* is now flowering in the Kew collection, the whole plant being under 6 inches high, and its wants seem to be amply provided for within the limits of a shallow pan of about 3 inches diameter, in which it is suspended. It was presented in February of the present year by P. F. Garnett, Esq., of Aigburth, near Liverpool, with the information that it was collected in some locality in the vicinity of the River Amazon. It is allied to *C. barbatum*, Lindl., and in general aspect is much like a miniature edition of this plant. The pseudobulbs in the imported plants were conical, 2 inches long, and with five black rings; but in the two growths since made they are compressed-ovate, 1 inch long by half an inch broad, and bearing three leaves. It may, however, be noted, that while the new pseudobulbs are not fully developed, they are strong enough for each to throw up a raceme almost as strong as one sent from the wild habitat. The leaves are lanceolate, 4 inches long by 6 to 8 lines broad, acute, and a little undulate. The erect peduncle equals the leaves, and has four sheathing bracts below the flowers, while the flowering bracts are ovate; one raceme bears seven flowers, the other four, while the wild raceme appears to have had nine; the pedicels three-quarters of an inch long, the diameter of the flower, from the tip of the upper sepal, 1½ inch, and the colour very light green, heavily blotched with dark chocolate-brown, the blotches somewhat transversely arranged, and the lip white. Sepals lanceolate-linear, acute, 10 lines long, concave. Petals similar, but slightly convex, and a little reflexed. These are subparallel with the upper sepal, as in *C. callosum*, while the lateral sepals make an angle of about 90° with each other. Lip three-quarters of an inch long, linear, from a somewhat broader base, the apex divided into about seven somewhat diverging bristles, a similar number of shorter ones on either side near the base, and some half-dozen others on the margin below the middle. A blunt conical spur is situated near the middle, and a strong curved horn a quarter of an inch high on basal angle. Under side of lip faint green, with a few reddish-purple spots; column light green, antennæ slender, subparallel. It is a singular and very elegant little plant. R. A. Rolfe.

### TRICHOSMA SUAVIS, Lindl.

This name being accepted and well known in the gardening world I retain it, though the plant has no genuine marks of distinction from *Eria*, as Dr. Griffith, myself, and finally Dr. Lindley stated (see contributions to *Indian Orchidology*, ii. *Eria*, § VI.). The dark brown lines on the white ground of the lip remind one of *Coleogyne*, though a side view of the flower shows the most distinct *Eria* or *Maxillaria* shape. Dr. Lindley himself at first called it a *Coleogyne*, and proposed his genus *Trichosma* later, cancelling the original name himself, in accordance with my opinions.

I have now at hand a little wonder of beauty, a trilobellia, as I call it, a tripetalia would likewise deserve the name of peloria. If the word peloria be used one does not know which of the two, sepals or petals, is intended. The three petals have the same colour and the keels of the lip, but there is the single mark of distinction that they are not trifid, but entire.

I have to thank for this most agreeable surprise our enthusiastic orchidist, Mr. Fred. Tautz, Goldhawk Road, London, whose collection is so rich in rare and well-grown Orchids. (H. G. Rehb., f.)

### CYPREPIDIUM INSIGNE (Wall.) SANDER & SONS (Hort. Sand.)

Baron von Schroder had the kindness to send me this surprisingly beautiful novelty, which was imported with other varieties by Mr. F. Sander, and dedicated by him to Mrs. Sander, a great lover of Orchids. It is very beautiful; the odd sepal has the upper part white, the white colour descending on

\* Chapter House Accounts, C. 3, f. 721.

† John Chapman was first employed by Wolsey as gardener of his palace at Kingston. He was then (in 1515) removed to Hampton Court, and very soon after was promoted to the position of head gardener. When Henry VIII. took possession of the palace he was again promoted—this time to the position of the "king's head gardener," with a salary of 12*l.* a year. He died about the year 1540.

both sides on to the margin. The lower part is light yellowish-green, with a few small brown spots on each side of moderately dark tint. The broad connate sepal is of a light yellow, with two very small brown spots at the base. Petals nearly undulate, rather broad and blunt, sulphur-coloured. Lip

thing like it before. It was kindly sent to me by Mr. Horsman, of Colchester, whose name it justly bears.

Its general floral character may be indicated by stating its narrow, and yet not too narrow, shape. The odd sepal is blunt, cuneate-oblong, and the

ZYGOPETALUM MARGINATUM, *Rehb. f.*

A plant of this old but apparently rare species is now flowering in the Kew collection, having been sent from New Grenada by Patin. It belongs to the section *Warsceviczella*, and is also known as *W. marginata*. It grows 6 inches high, and its narrowly cuneate-oblong leaves are flabellately arranged, as in this section of the genus. Its flowers are solitary, large, and fragrant, the colour white, with a broad band of maroon-purple round the lip, a few streaks of the same colour on the curiously toothed disc, and three irregular violet lines in front of the same. The incurved side-lobes just meet at their tips, which is one of the characters by which it may be distinguished from the closely allied *Z. velatum*. It was introduced in 1853 by Messrs. Jackson, of Kingston, and is described in these columns at p. 617 of that year, as *Warrea quadrata*, by Dr. Lindley. It is also well figured at t. 4766 of the *Botanical Magazine*, under the same name, Sir William Hooker having obtained a plant from the same source. *R. A. Rolfe.*

## DISA CULTURE.

Now that some of the rarer *Disas* are flowering in our gardens, a few notes as to a general plan of culture for the different sections, and especially of the grassy-leaved ones, including *graminifolia* and *D. lacera*, figured in the *Gardeners' Chronicle*, p. 664, may be of use in helping to secure a better understanding of these beautiful plants. For years I have grown Cape terrestrials, and have never lost an opportunity of getting information from my numerous South African correspondents as to their habits and surroundings in their native home. The result of these experiences conclusively prove to me that before success can be attained with certainty, the genus *Disa*, for cultural purposes, must be divided into two distinct sections.

*Section I* may be called the *grandiflora* division, as that species is best known to us; under it come *D. uniflora*, commonly known as *grandiflora*, *D. racemosa* (illustrated in the *Gardeners' Chronicle*, May 12, 1888), *D. venosa*, which I have now secured after years of steady endeavour; *D. sagittalis*, *D. cornuta*, *D. crassicornis*, *D. polygonoides*, and others of like habit. These are leafy plants inhabiting more or less marshy places, and they will all thrive grown together with *D. grandiflora* (*uniflora*), with some little differences which the following observations as to their mode of growth may point out:—*D. grandiflora*, *D. racemosa*, *D. venosa*, and *D. sagittalis* are strictly evergreen, and are always growing either above or below ground; they increase by the old tubers producing new ones, and also by leafy growths borne on stolons or running underground stems. These require keeping moist all the year with but little variation. Some time in October is the best for repotting them, and the material used, peat, sphagnum moss, crocks, and charcoal, and some think added loam and fibre beneficial.

*D. crassicornis*, *D. cornuta*, and *D. polygonoides* have no stolons, but perpetuate themselves by direct increase from tuber to tuber after the manner of *Satyrium*, or by seed—a mode of propagation which is a safe and certain means of guarding against destruction to the old stock, which is much resorted to by South African terrestrial Orchids in their wild state. *D. crassicornis*, one of the handsomest and sweetest of the genus, grows on the Boschberg, and in other places, at an altitude of over 4000 feet, principally in loamy soil, and in moist shady situations, where it frequently gets ice and snow about it. Under cultivation I find it take kindly to turfy-yellow loam and a little sphagnum moss, and this may be one of the essentials to its good culture.

*D. polygonoides* and *cornuta* grow in boggy, sandy peat, and these two last lose their foliage after flowering, and for a time should have a limited supply of water, but not be kept quite dry for the new tubers immediately begin to grow after

FIG. 97.—THE CORSICAN PINE, *PINUS LARICIO*, AT KEW. (SEE P. 692.)

darker sulphur-coloured. Stamens bright yellow, with the knob of an orange colour. Peduncle and bract light green. This is decidedly a most remarkable plant, and a fresh ornament to the collection of Baron von Schroder. *H. G. Rehb. f.*

*CYPRIPEDIUM INSIGNE* (*Wall.*), VAR *HORSMANIANUM*, n. var.

A remarkably elegant variety. I never saw any-

upper part is quite white, the lower like the remainder of the flower, has likewise the usual colours. The lower sepals are narrow, oblong-ligulate, acute. The petals are directed forwards, and are spreading at the top. The lip is very remarkable in having a beak in the middle of the mouth, and rather low side-partitions. In these days of *Cypripediums* it might prove exceedingly valuable for hybridisation. *H. G. Rehb. f.*

the old foliage decays. All the above grow well together in a cool-house.

**Section 2.**—Now we come to the grassy-leaved section whose greatest misfortune, I believe, has been their generic name, *Disa*, causing gardeners to come to the conclusion that they require growing with and on the same lines as the beautiful *D. grandiflora*, whose culture is now well understood by so many. The grassy-leaved section comprises *D. graminifolia*, *D. lacera*, *D. barbata*, *D. lugens*, *D. venusta*, *D. spatulata*, *D. Zeyherii*, and *D. ferruginea*, and others, the two last named having broader and softer leaves than the others named, which are rather hard and rush-like. All these grow in very different situations to the *grandiflora* section, and are always found in the open, growing with *Heaths*, *Agapanthus*, &c., and generally in sandy peat of precisely the same quality as that used for potting *Heaths* and New Holland plants in this country. The presence of the *Heath* with this section of *Disa* should in itself be a sufficient guide to their culture, and those who grow the grassy-leaved and blue *Disas* in the same way as *D. grandiflora* need only ask themselves how *Cape Heaths* would fare under such treatment. None of the *Disas* of this section have stolons, but increase by the old tubers making one or more new ones, the progress of which I have watched by keeping the tubers in sphagnum and uncovering and inspecting them frequently. This section of *Disa* will grow with *D. grandiflora* if placed on a shelf or in some situation where the air is not too moist, or they may be grown in a cold frame or with *Cape bulbs*. They are all deciduous, and the main point of difference from the evergreen section is that they require a distinct period of rest and even absolute drying off at the end of the summer or at any period commencing six weeks before the flowering time of each species; indeed, it is the neglect of this drying off which has been the chief reason of the blue *Disas* not flowering in gardens, for I find that so tenacious of life are they that they survive healthy in the tubers under the most inconsistent treatment, although the flowers are not produced. In point of fact, they require a season of growth and rest, like the *Nerine*; and, like the *Nerine*, a drying off until the flower-spikes appear is necessary, otherwise the energies of the plants are diverted to the object of growth instead of the production of flowers. All this section of *Disa* will do best potted in sandy peat, and kept below the rim of the pot as in ordinary plants, and, above all things, a pure clear air not heavily charged with moisture is essential. Generally speaking, the grassy-leaved *Disas* are winter-flowering.

A South African correspondent says:—"In the case of the blue *Disa* the flower-spikes always precede the leaves. It comes into flower in South Africa in December, January, and February, which are the hottest and driest months; after being in flower six or eight weeks the flowers fade and up come the leaves, which remain green for about six months." With respect to the remarks about their flowering in the hot weather, we must recollect that our winter is the Cape summer, but as bearing on this I learn that a great number of African terrestrial Orchids grow in shady places, or, as in the case of these grassy-leaved *Disas* and *Satyrium*s on southern slopes, which, we must also remember, is the shady aspect in the Cape. With the *Disas* as with other Orchids, we must not consider the question of heat in the winter, or attempt to imitate what they get at home, as we can better secure the good culture of the plants by acclimatisation to our temperate culture. In my opinion a clear light, but not direct sunlight, in the summer, and a clear pure air, are of the highest importance to the culture of these plants; and when the theory of proper management is grasped, all of them I believe can be as well grown by the amateur with a cold frame as by the gardener with greater resources; indeed I have several species, including a large specimen of *D. racemosa*, with fifty or sixty growths which have never known a single degree of artificial heat since they were imported eighteen months ago.

In a future number I will give a few notes of the culture of *Lissochilus*, *Disperis*, *Huttonia*, &c., but I must here state that I believe by far too much water is given to all *Cape terrestrial Orchids* (except the marsh-growing ones) under cultivation, and that they succeed best when watered simply as *Heaths* or other plants. *James O'Brien, Harrow-on-the-Hill.*

## PLANTS CERTIFICATED DURING THE HALF YEAR ENDING DEC. 31, 1888. BY THE ROYAL HORTICULTURAL SOCIETY.

The following received First-class Certificates:—

<i>Adiantum versaillese</i> ...	Williams, Aug. 28.
" <i>Waltoni diffusum</i> ...	Walton, Oct. 9.
<i>Allium pedemontanum</i> ...	Ware, July 10.
<i>Angulosa Ruckeri alba</i> ...	C. Dorman, July 24.
<i>Aster Townshendii</i> ...	Ware, Sept. 26.
<i>Beet (ornamental) McGregor's</i> ...	Williams, Sept. 25.
" <i>Favourite</i> ...	Ware, Aug. 14.
<i>Begonia G. Shawell</i> ...	Cannell, Oct. 9.
" <i>General Chichester</i> ...	Cannell, Oct. 9.
" <i>Mrs. Lascelles</i> ...	Cannell, Aug. 28.
" <i>Mrs. Lynch</i> ...	Cannell, Aug. 28.
" <i>Mrs. Stark</i> ...	Cannell, Oct. 9.
" <i>The Lady</i> ...	Cannell, Aug. 28.
<i>Campaula isophylla alba</i> ...	Ware, Aug. 28.
<i>Canina Admiral Courbet</i> ...	Cannell, Aug. 28.
" <i>Capricieux</i> ...	Cannell, Aug. 28.
" <i>Francesque Morel</i> ...	Ware, Aug. 28.
" <i>Geoffroy St. Hilaire</i> ...	J. Veitch & Sons, Sept. 25.
" <i>Paul Bert</i> ...	Cannell, Sept. 25.
" <i>Madame Just</i> ...	Cannell, Aug. 28.
" <i>Ulrich Brunner</i> ...	J. Veitch & Sons, Oct. 9.
<i>Caration R. H. Elliot</i> ...	Laing & Mather, Aug. 11.
" <i>Elaine</i> ...	J. Douglas, July 24.
" <i>Germania</i> ...	Hooper & Co., July 10.
" <i>Madame Carle</i> ...	May, Sept. 11.
" <i>Scarlet Bedder</i> ...	R. Dean, July 24.
<i>Carpenteria californica</i> ...	Miss Jekyll, July 10.
<i>Cattleya Harrisii</i> ...	Baron Schroder, Oct. 23.
" <i>Lamberhurst, hybrid</i> ...	Baron Schroder, Oct. 23.
<i>Chrysanthemum Avalanche</i> ...	G. Stevens, Nov. 13.
" <i>Madeline</i> ...	R. F. Foxon & Sons, Oct. 23.
" <i>Elsie</i> ...	Stevens, Oct. 9.
" <i>G. Molyneux</i> ...	G. Stevens, Oct. 23.
" <i>Sunflower</i> ...	W. Holmes, Oct. 23.
" <i>Lincoln's Inn</i> ...	R. Owen, Oct. 23.
" <i>Magicienne</i> ...	G. Stevens, Nov. 13.
" <i>Mr. Garner</i> ...	Hawkins & Bennett, Sept. 11.
" <i>Mrs. H. Hawkins</i> ...	W. Holmes, Oct. 23.
<i>Cœlogyne Sanderiana</i> ...	Baron F. de Rothschild, July 10.
<i>Croton Aigburth Gem</i> ...	Ker & Son, Aug. 14.
<i>Diplazium Admiration</i> ...	Turner, Sept. 25.
" <i>Agnes</i> ...	Turner, Sept. 25.
" <i>Beauty of Brentwood</i> ...	West, Aug. 28.
" <i>Duchess of Albany</i> ...	Cheal, August 28.
" <i>Eurydice</i> ...	Keynes, Williams & Co., Sept. 25.
" <i>Honoris</i> ...	Keynes, Williams & Co., Sept. 25.
" <i>Hugo</i> ...	Turner, Sept. 25.
" <i>John Cooper</i> ...	Humphries, Sept. 25.
" <i>Juliette</i> ...	Turner, Sept. 25.
" <i>Lady Montefiore</i> ...	Cheal, Sept. 25.
" <i>Little Darkie</i> ...	Keynes, Williams & Co., Sept. 25.
" <i>Little Ethel</i> ...	Keynes, Williams & Co., Sept. 25.
" <i>Lothair</i> ...	Turner, Sept. 35.
" <i>Matthew Campbell</i> ...	Keynes, Williams & Co., Sept. 25.
" <i>Maud Fellowes</i> ...	Turner, Sept. 25.
" <i>Mikado</i> ...	Girdlestone, Sept. 11.
" <i>Panthea</i> ...	Keynes, Williams & Co., Sept. 25.
" <i>Victoria</i> ...	Turner, Sept. 25.
" <i>Vivid</i> ...	Turner, Sept. 25.
" <i>Whisper</i> ...	Keynes, Williams & Co., Sept. 25.
<i>Delphinium Horus</i> ...	Kelway, August 28.
" <i>Prince of Naples</i> ...	Kelway, July 10.
" <i>Ustane</i> ...	Kelway, July 10.
<i>Dianthus splen'ens</i> ...	R. Dean, Sept. 11.
<i>Eremurus Ogle</i> ...	Ware, Sept. 11.
<i>Escallonia Philippiana</i> ...	J. Veitch & Sons, July 10.
<i>Gaillardia splendissima ple-nissima</i> ...	Kelway, Aug. 28.
<i>Glaucidium acia</i> ...	Kelway, Aug. 28.
" <i>Besler</i> ...	Kelway, Sept. 11.
" <i>Bullion</i> ...	Kelway, Aug. 28.
" <i>Castro</i> ...	Kelway, Sept. 11.
" <i>Cebes</i> ...	Kelway, Aug. 28.
" <i>Magas</i> ...	Kelway, Aug. 28.
" <i>Mago</i> ...	Kelway, Aug. 28.
" <i>Nicon</i> ...	Kelway, Aug. 28.
<i>Gymnogramma Decebel robusta</i> ...	J. Veitch & Sons, July 10.
<i>Halimolobos rigidum semi-plenum</i> ...	Ware, Sept. 25.
<i>Iris Enterprise</i> ...	Gordon, July 24.
" <i>Kaiser Wilhelm</i> ...	Gordon, July 24.
<i>Lælia Amesiana</i> x ...	Baron Schroder, July 24.
" <i>porphyrea</i> ...	Baron Schroder, Oct. 9.
" <i>Victoria</i> x ...	Baron Schroder, Nov. 13.
<i>Lastrea montana ramo-coro-nata</i> ...	Birkenhead, July 24.
<i>Lilium nepesense</i> ...	Low, Sept. 11.
" <i>Wallichianum</i> ...	Ware, Sept. 25.
<i>Nerine excolens</i> ...	Ware, Sept. 25.
<i>Neorhynchodictyon</i> x ...	J. Veitch & Sons, Oct. 9.
<i>Nothofagus Muelleri</i> x ...	Birkenhead, July 24.
<i>Odontoglossum Karwinskii</i> ...	Vanner, Aug. 28.
<i>Oncidium Mastinii</i> ...	J. E. Crook, Oct. 23.
" <i>ornithorychum</i> ...	J. Veitch & Sons, Oct. 23.
	Williams, Sept. 11.

<i>Oreocome Candollei</i> ...	C. Noble, July 24.
<i>Ostrowskya magnifica</i> ...	J. Veitch & Sons, July 10.
<i>Papaver orientale</i> var. <i>Blush-ing Queen</i> ...	Ware, Aug. 14.
<i>Primula Swanley Pink</i> ...	Cannell, Dec. 31.

## ORCHID NOTES AND GLEANINGS.

### CŒLOGYNE MASSANGIANA.

ALTHOUGH not long introduced, this species has become a much valued one; certainly its merits entitle it to be so, for it grows and blooms freely, and its flowers are extremely handsome, and continue a long time in perfection. The pendant scapes are from one to 2 feet long, sometimes producing considerably over twenty flowers, and as each of these from 2 to 3 inches across, a flowering plant when suspended has a very pleasing effect. The sepals and petals are narrow, oblong, and of a light, almost transparent, yellow; the lip is three-lobed, the lateral lobes on the inner side being of a rich maroon-brown beautifully veined with yellow; the central lobe is reddish-brown at the front, having a margin of creamy-white and three yellow ridges traversing the whole length. This Orchid is best grown in a basket of peat fibre and sphagnum, and requires a position at the warm end of the Cattleya-house. It is figured in vol. xvii. of the *Gardeners' Chronicle* (March 13, 1882). *W. B.*

### CŒLOGYNE GARDNERIANA.

This handsome species is quite distinct from the other *Cœlogyne*s in cultivation, and worth growing on account of its flowering during the winter. It has dark green, somewhat flask-shaped pseudobulbs each bearing two broad lanceolate leaves. The flowers, borne on drooping racemes, are pure white, with the exception of the apical lobe of the lip, which is yellow. The flowers do not open widely, and each is clasped at the base by a large, stout, greenish bract; the sepals and petals are narrow, about 2 inches long. It is a native of Khasya, having been originally introduced about fifty years ago. It succeeds well grown in the Cattleya-house in a compost of peat and sphagnum. *W. B.*

### DISA (GRANDIFLORA) UNIFLORA.

The very interesting notes on *Disas* in last week's *Gardeners' Chronicle* recall to my mind an experiment I tried in their culture last summer, with the view of testing their behaviour under outdoor treatment. About thirty small plants were placed in a cold frame the second week in May. Towards the middle of June the light was taken entirely off, and the plants exposed to the weather day and night, with the exception of slight shade in sunny weather. On October 1 we had 13° of frost, to which the plants were exposed with only the glass protection of a cold frame. Their foliage and the soil in their

pots was frozen quite hard, and I fully expected to see them all killed; but after adopting the usual treatment with frozen plants, I was pleased to see they had suffered no harm, and are now as healthy as those grown in the usual way. The only value this experiment possesses is that it shows that *D. grandiflora* may be successfully grown in a cold frame, and also that a few degrees of frost will do it no harm, if grown under cold treatment. *Owen Thomas.*

#### PLATYCLINIS UNCATA.

This species and its allies are better known in gardens under the name *Dendrochilum*. Although individually the flowers are small, and not brightly coloured, the genus contains some of the most elegant of Orchids. Of the above species there is a plant now in flower at Kew; the flowers are pale-green, and not more than half an inch across; but nothing could be more graceful than the numerous, arching racemes springing from the apices of the small pointed pseudobulbs. The flowers are arranged in two opposite rows, and forty or more may be counted on a scape. It is a native of the Philippine Islands, whence it was introduced by Messrs. Low. It should have a moist position in the intermediate-house.

*P. Cobbiana* is of a similarly graceful habit; its leaves are larger, and the lip is orange-yellow. It is also found in the Philippines.

#### ACAMPE DENTATA, Lindl.

This appears to be the showiest species of this singular little genus, and a well-bloomed specimen in the Kew collection shows it to be at least equal to some species of *Saccolabium*, to which the genus is closely allied. The plant is 8 inches high, the leaves distichous, linear-oblong, and unequally bilobed. The panicle is erect, 6 inches high, with numerous branches, and the flowers, which much resemble those of *A. papillosa*, are yellow, spotted and barred with brown inside, straw coloured and unspotted outside, and the lip white. The plant bears three racemes, and although the flowers are small, still, seen, in the mass, they are quite as effective as some others more commonly met with in collections, and far more so than any other *Acampe* I have seen. It is a native of Sikkim, and has also been reported from Mouleim, though I have not seen wild specimens from the latter. *R. A. R.*

### PLANTS IN FLOWER AT KEW.

THE following are the most interesting of the plants flowering this week at Kew:—

*Randia macrantha*.—A large-flowered shrub, very similar to *Gardenia Stanleyana*, now referred to *Randia*. The former has oblong shining green leaves in fascicles, the largest 6 inches long by 2 inches broad. The flowers are terminal on the stronger branches, with a very short pedicel, six linear calyx lobes three-quarters of an inch long, and a narrow tubular corolla, 9 inches long, the lower 6 inches no thicker than a goosequill, widening towards the mouth, where it becomes 1 inch across; the five ovate corolla lobes are spreading and slightly recurved, pure ivory-white. The upper part of the flower is not unlike the flower of *Lilium longiflorum*. The Kew plant is 5 feet high and bear eight flowers. *R. Stanleyana* is similar in habit, with flowers of a creamy-yellow colour blotched with dark brown. The genus is a large one, and is widely distributed in the tropics. Many of the species bear small insignificant flowers.

*Strelitzia Nicolai*.—The large specimen of this in the Palm-house is again in flower. It is 25 feet high, with a naked stem, a head of large distichous leaves, and two scapes, one on each side of the stem about 15 feet from the ground. The large boat-shaped deep purple bracts, 1 foot long and 3 inches deep, with a cluster of flowers projecting from them, and the white sepals and blue halberd-like petals, are exceedingly interesting. A very copious secretion of a gum-like substance almost fills the bract by the time the

flowers are all expanded. There is little difference between this and *S. augusta*.

*Impatiens Hookeriana*.—This is one of the hand-somest of the tropical species of *Impatiens*, and it would become as popular in gardens as *I. Hawkeri* and *I. Sultani* if it flowered more freely than it does. The Kew plant tried to bloom last year but the buds were destroyed by the fogs. This year, however, it has escaped, and it is now gay with numerous racemes of large prettily marked flowers. It is 2 feet high and nearly a yard through; each branch bears two or more racemes, and these have each two or three flowers 1½ inch across, the segments recurved, pure white, the two lower ones blotched and spotted with crimson, and suggesting the lip of an Orchid. The spur is narrow, 2 inches long, and curved. This species lately flowered at Glasnevin, as also did the richly coloured, quaint-flowered *I. Jerdoniae*, of which Mr. Moore possesses a very fine variety. Both these species are Indian and tropical.

*Hibiscus surattensis*.—This species has lately been sent to Kew, by the Rev. H. Goldie, of Old Calabar, well-known as the introducer of the gigantic-flowered *Aristolochia Goldieana*. The *Hibiscus* is a thim-steamed, many-branched plant, covered with soft hairs, and scattered, short, brown prickles, which extend even to the principal nerves of the leaves. These latter are long petioled, variously lobed and toothed, from 1 to 2 inches across. The flowers are freely produced on short peduncles from the axils of the leaves. A large involucre of very extraordinary character subtends each flower. It is composed of numerous narrow, spoon-shaped bracteoles, each having a long spur-like filament rising from the "spoon-blade," and pointing towards the flower. The petals form a cup 2 inches across, and coloured bright yellow, with blotches of crimson at the base. This species is very near *H. furcatus*, and both of them are common in the tropics of Asia, Africa, and Australia.

*Befaria glauca*.—This handsome little greenhouse shrub is likely to prove useful as a winter-flowering plant. The Kew plants were raised from seed sent from Bogota, in 1870, to the present plant flowering when about seven years old. But they are flowering more freely now, and like all plants raised from seed, when once they get to a flowering age cuttings from them will probably flower almost as soon as struck. The *Befaria* is about 3 feet high, and bears a terminal head of flowers which are arranged on several erect racemes. Each flower is about 1 inch across, shallow, bell-shaped, with prominent stamens and stigma, and coloured pale pink. Probably this plant would hybridise with *Rhododendron*. It may be seen in the Temperate-house.

*Solantra grandiflora* continues to develop its large funnel-shaped creamy-white flowers in the Succulent-house. Apparently this species varies considerably in the form of its flowers, as well as in colour. To bloom it a poor sandy soil appears to answer better than a rich compost, the latter inducing too vigorous and sappy a growth for flowers.

*Canarina campanula* is a delightful old greenhouse plant, which flowers all through the winter, and goes to rest during summer. It has a large tuberous rootstock, and annual many-stemmed stems with opposite hastate leaves, 2 inches long, and bell-shaped nodding, brown-yellow flowers like those of the common Canterbury Bells. It is exceptional amongst *Campanulaceae* in the colour of its flowers. The rootstock is said to be used as food in the Canary Islands, where the plant is a native.

*Begonia Scharffii*.—This plant is referred to here for the purpose of correcting an omission in the description lately published in the *Botanical Magazine*, where a figure of *B. Scharffii* lately appeared (t. 7028). It will be remembered that at one of the meetings of the Royal Horticultural Society held in July a large-leaved noble-flowered *Begonia* was shown from Kew, under the name of *B. Haageana*. Plants and cuttings from this have since been distributed under the latter name, which had been given in compliment to the senior member of the firm of Messrs. Haage & Schmidt, Erfurt, who sent the plant to Kew. The name was altered by Sir Joseph Hooker, at the request of Messrs. Haage & Schmidt. Readers will therefore understand that *Begonia Scharffii* is the proper name of the plant hitherto known as *B. Haageana*. Plants of it are still in flower in the *Begonia-house*.

*Protea cynaroides* and *P. nana*, two very interesting *Proteas* from the Cape, will shortly flower here. *W.*

### THE AGRICULTURAL RETURNS FOR 1888.

In the (for the present) shelved Bill designed to assist in the establishment of a Ministry of Rural Affairs, designated the "Board of Agriculture," we find in clause 11 a small section which says:—"The expression 'agriculture' includes horticulture and forestry." It is quite natural, therefore, to look in a Government agricultural return for such matters as we are interested in. Truth to tell, we are not in this instance disappointed. From beginning to end the 200 odd pages are brimful of interest and information to those who care for the manipulation of figures. So far as memory serves us, there appears to be a difference in the tabular arrangements here and there compared with those of preceding years, which may make certain conclusions more troublesome to arrive at; but for the general reader the present arrangement of crops in counties, &c., appears to be very concise and compact.

#### NURSERIES, WOODS, PLANTATIONS, &c.

In the "Editorial Summary" it is stated under this head that in land used by nurseries for the growth of trees, shrubs, &c., the returns show a slight decrease from the acreage of 1887. The land used by nurseries in England amounts to 10,496 acres compared with 10,663 in 1887; Wales foots up 292 against 277 acres; and Scotland, 1477 acres against 1532 last year. Possibly that decrease is only temporary, owing to the rapid development of our larger cities and towns, and the rooting up of old concerns. Next year's figures will very likely tell a different tale.

Of the average of woods and plantations a special return has been obtained for this year. The last return was made in 1880, in which certain corrections, due to subsequent inquiries, were made and inserted in the returns published in 1881. Since that date the acreage appears to have increased in Great Britain from 2,458,300 acres to 2,560,700 acres, or nearly 4·2 per cent. In many of the northern counties and in Scotland large additions are recorded. The increase in England has been nearly 52,300 acres; in Wales, 4800 acres; and in Scotland 45,400. The total increase in Great Britain has been about 102,400 acres.

#### SMALL FRUIT CULTURE.

Under this heading we note that the extent of land returned as under the culture of small fruit, such as Gooseberries, Currants, Strawberries, &c., whether in orchards or in market gardens, amounts this year to 36,700 acres. In many countries the collecting officers report that the practice among farmers of appropriating land to the growth both of fruit and vegetables has further extended in order to meet the demand for them; and though the additional quantities of land may, as regards individual occupiers, be relatively small, in the aggregate they become considerable. It is stated in a report from the county of Norfolk that from only one small station on the Eastern and Midland Railway nearly 100 tons of fruit are sent weekly to Manchester and other towns in the North of England at certain periods of the year; and this is cited as a single illustration only of what is being done throughout that county.

#### ORCHARDS, MARKET GARDENS, &c.

A decrease is recorded this year of 3056 acres in the area of orchards in Great Britain, it being now 199,178 acres; but the smaller extent shown must be considered in connection with the newly ascertained acreage of small fruit, the apparent deficiency having doubtless arisen from part of the land which should last year have been returned as growing small fruit having then in some cases been placed in the orchard column of the schedule sent out to occupiers, &c. The acreage now returned may, it is confidently believed, be taken to represent more accurately than in any preceding year, the actual area so covered; the land under grass, or upon which small fruit is grown, or which is left fallow in orchard, as may happen to be the case, being included under these several heads in the returns.

The acreage under market gardens is this year 67,383 acres as compared with 62,666 in 1887—an increase of 4717 acres.

## IMPORTS.

From a statement showing the value of products imported into this country we extract the following few lines, which may be read in connection with our monthly summary of reports under the heading of "stock-taking":—

Imports enumerated.	1888.	1887.	Difference.
Fruit (raw), including Apples, &c., and other fruit not otherwise described ... ..	3,635,650	3,273,904	—361,746
Vegetables—including Potatoes, Onions, and "unenumerated" ... ..	1,846,645	2,191,947	+345,302

From a statement showing the values of certain imports we extract the following "yearly averages" under the heading of "fruits, nuts, and vegetables":—

Years.	Value.	Years.	Value.
	£.		£.
1861—65	2,014,547	1876—80	6,934,185
1866—70	2,469,991	1881—85	6,352,063
1871—75	4,352,181	1886—87	6,253,035

Possibly to some it may appear rather late in the day to give these figures, seeing how near we are to the close of 1888, but they will not prove so to such as make a note of our monthly statements and are interested in the thorough utilisation of English soil.

The compiler concludes his introductory remarks as follows:—"It may not be safe to say that the lowest ebb in movement of prices has been reached, but there are indications of early advance, if no monetary crisis or business convulsion should intervene, of which there are no immediate indications. An interest that represents £480,000,000, and, including horses and other animals in cities, not far from £600,000,000, is one of the very first agricultural importance that demands the most intelligent endeavour of farmers to obtain the largest possible annual income from such an investment at the lowest possible cost."

We add the following "Summary of Agricultural Produce Statistics (Wheat, Barley, and Oats) of England, Wales, Scotland, and Great Britain, for 1888" \* :—

\* Supplied by the Agricultural Department, Privy Council Office, under date December 11, 1888.

† Estimators state that there is a large proportion of light corn, and that generally the grain is inferior in quality.

## PLANT NOTES.

## MAXILLARIA PICTA.

THOUGH not a particularly showy Orchid, it is exceedingly free and profuse, and where cut flowers are in demand this should find a place, as flowers may be gathered from it in the way that one gathers Violets, and with ordinary attention it never fails to produce abundance of blossom. It has a very strong odour, resembling that of Almonds. The scapes are from 5 to 6 inches in height, the petals and sepals are incurved, dotted and streaked with dull purple and chocolate. It is a native of Brazil, and was figured in *Bot. Mag.*, t. 3154. *W. Harrow, Botanic Garden, Cambridge.*

## ABUTILON VEXILLARIUM

as a wall plant for sunny positions out-of-doors is a great deal better than would seem possible, judging the plant only by what it is when grown in a pot in a greenhouse. It grows freely, is evergreen, and flowers most abundantly in the autumn and early winter. Last year it was gay with flowers even at Christmas. It is covered with bloom now, in spite of severe morning frosts and fogs. Each flower is  $\frac{1}{2}$  inch long, urn-shaped, with five prominent ribs, suggestive of a Chinese lantern; the colour is deep scarlet and lemon-yellow, with a brush-like cluster of stamens protruding beyond the mouth about half an inch. The beauty of the branches when with these flowers hanging from almost every leaf-axil is easier imagined than described. A plant may be seen under the conditions suggested above in flower at Kew. *W. W.*

## JACARANDA (BLUE TREE).

Under this name seeds of the above have been received from Madeira, and this suggests itself as a very suitable plant for dinner-table or other decorative purposes. The leaves are bipinnate, and in habit and appearance bear a resemblance to the fine-leaved Acacias, though it belongs to the order Bignoniaceae. Its growth is very light and elegant, and Mr. Lynch, Cambridge Botanic Garden, considers it to be *J. ovalifolia* of *Bot. Mag.*, t. 2327. It differs from our plant of *J. mimosaefolia*, to which

the former is said to belong. It should be grown as a stove plant, for when subjected to cool-house treatment the leaflets fall off prematurely. Cuttings strike readily when the plants are in a growing condition by placing them in a close case, or beneath a bell-glass in bottom-heat for a fortnight or so, potting them into a mixture of loam, leaf-mould, and sand when rooted.

## ADHATODA CYDONIOLIFOLIA.

This makes a very effective plant when trained in such a style that its flowering branches hang naturally in festoons or streamers. To tie it in closely to stakes or on wire-shaped balloons means simply subtracting from its beauty. The flowers are borne in spikes in the axils of the opposite leaves, generally in fours. The lower lip of the corolla is of a dark purple, which is almost divided into two parts by a streak of white down the centre. It should be planted out in a well-drained position in a mixture of peat loam and sand, and grown in a structure with a temperature ranging between that of a stove and cool-house. Cuttings strike easily at any time of the year, but are best taken in the spring or summer months, when if placed in bottom-heat beneath a bell-glass root in the course of a fortnight or so. In a flower before me there are two kinds of hairs borne on the outside of the corolla—one long, the other short, the latter being somewhat globular at the extremity, but cannot say whether of a secreting nature or not. *W. Harrow, Cambridge Botanic Garden.*

## SATYRIUM CARNEUM.

THE accompanying illustration (fig. 98), prepared by Miss Barr, from a specimen which flowered with Messrs. De Graaf, Brothers, of Leyden, in August, represents one of the earliest introduced of the *Satyrums* (1797), and still one of the finest of them. So handsome, indeed, is its stately spike of rose-pink flowers, rising from the flat, orbicular, and fleshy leaves, that one is apt to be surprised that it and the other representatives of this beautiful genus are not more commonly seen in gardens. The fact is that the numbers of them which have fallen into careless hands, and, therefore, failed to be satisfactory, have gained for the genus the character of being difficult to grow and flower. Such is not the case, however, provided the plants be treated in a proper manner, and strictly as cold-house or frame plants. My experience of *Satyrums* is that they thrive best grown in a frame from which the frost is kept out or in an ordinary greenhouse on a shelf near the glass of the roof. They rejoice in abundance of light, but are easily injured by direct sunlight. They grow well in a mixture of turfy peat and loam-fibre, with a good supply of sand added, or in just such a mixture as Hyacinths are usually potted in, but rather more sandy; they do not like watering over the foliage, and require water in the pot only like ordinary plants, and not in abundance, as with *Disa grandiflora* and other terrestrials of that class.

The South African species here alluded to may be said to be September flowering, although some may come in in August and some in October. Immediately after flowering the leaves decay, and from that time until they show signs of growing again but very little water should be given. Water may safely be given from May onward until after flowering, and in May any which require potting should be attended to. Above all things, a close house or pit is bad for *Satyrums*, for which free pure air is one of the most necessary things. By observing the above rules I have grown and flowered well *S. carneum*, rose; *S. Hallackii*, fine rosy crimson; *S. acuminatum*, pure white; *S. coriifolium*, orange; *S. candidum*, white; *S. membranaceum*, pink; *S. maculatum*, bluish to pink, with purple markings; and *S. erectum*, pink and purple. *S. acuminatum* I have even now out-doors with spikes in bud, and with only the protection of a sheet of glass. Of this plant it may be noted that the leaves, flowers, stalks and all, after drying, are delightfully and lastingly fragrant—so much so, that a correspondent informs me that it is

FIG. 98.—SATYRIUM CARNEUM: FLOWERS PALE PINK, BRACTS BROWNISH.

gathered and dried out in South Africa to use among clothes and lines as Woodruff is in some parts of Europe. Most of the other *Satyria* are also very fragrant when in bloom. *James O'Brien.*

## THE CHEMISTRY OF VEGETATION, IN REFERENCE TO THE GROWTH OF THE POTATO.

(Concluded from p. 633.)

**GROWING UNDER CONTROL.**—This question may perhaps be put:—Supposing we did know with exactness all the conditions under which a tuber is formed, and the limits of the variations which may be reached without materially affecting results, and did know the extent to which its formation, chemical composition, and period of maturing could be controlled, if the Potato were grown in houses where not only soil, temperature, and moisture of air, but also the colour and over intensity of the light could be arranged, how could all this knowledge help the cultivator who grows by the acre in the open, where his crop is exposed to climatal conditions which are so variable and so different in their variability from year to year, and so much beyond control? With our present partial knowledge, or, more correctly, want of knowledge, a complete answer to such a question cannot be given. We do not yet know enough of conditions and of results of conditions to know what we might do, but some few suggestions may be given that may help eventually to answer the question.

It is a well established fact plants do acquire "habit," that "habit" is transmissible by seeds or cuttings, and that it may become intensified in successive years. This intensifying in the case of propagation by seeds appears to depend on a less direct connection with the parent plant than in the case of cuttings; but as likeness of the offspring to the parent (with probabilities of "sport," which seem about equal in either cases) comes about from both means of propagation, the difference is probably more apparent than real. Be this as it may, a newly-acquired "habit," it seems, is sometimes inherited, and if the conditions that started it remain naturally, or are by art made to remain the same, the habit is intensified. In the case of dicious plants, and of artificial cross-fertilisation, there are two factors to consider in seed-propagation; in monocious plants and with cuttings, only one. In Potato growth, propagation by cuttings is the rule (as the tubers are but underground stems), artificial cross-fertilisation, to endeavour to produce a new "variety," quite the exception. But, judging by analogy from other plants, "habit" in the Potato might be intensified by either method of propagation. Potatoes are, as a rule, grown in such a haphazard way, and without any record of observations, that there seem no data for knowing what the limits of this intensifying are. Direct experiments continued over a series of years would decide this with at least some certainty.

Now, we have seen the way in which our modern theories of chemistry have influenced the investigation as to how starch is first formed in plants—that is, in plants generally. There have been no direct observations on the Potato so far as I can find; but there is no reason for supposing it offers any exception to the rule. The "reserve material" of a seed starts a young plant if grown from seed, of a stem if grown from a cutting (from a swollen stem in the case of the Potato). Then when the independent plant has grown far enough to "feed" itself it forms starch by decomposing carbonic acid and water. *But only under certain conditions.* The surface of the leaf must be moist; and light waves of certain lengths only and of certain combined "intensity" can effect this decomposition.

We need not trouble for practical purposes much about Pringsheim's hypochlorin. Sachs has repeatedly asserted and re-affirmed that starch is the first visible product formed. Pringsheim says hypochlorine precedes it. As a scientific study the subject is of interest, but practically both agree in this, that

the leaf is the organ in which the starch is formed, and there is no apparent important difference in these results as to the conditions under which it is formed. From this first formed carbo-hydrate all the others found in a plant are formed. What we want from a Potato is this starch in the form in which we can use it as food.

In the case of timber trees the rapid transference of carbo-hydrates to growing branches is a gain to the staleness of the tree. So, too, we appreciate a wealth of carbo-hydrates in leaves on plants cultivated for luxuriant foliage. But we do not grow Potatoes for staleness, or for handsome foliage, or for bright-hued flowers. We want the plants to put as much of their starch into their tubers as they can.

What is the ratio between the rate of decomposition of  $\text{CO}_2$  and  $\text{H}_2\text{O}$  (carbonic acid and water), with its change to starch,  $\text{C}_6\text{H}_{10}\text{O}_5$ , and the rate of tuber formation, is a subject no one seems to have worked at. In other words, we do not know, for the formation of, say, a pound of starch in so many weeks, what leaf area and what duration of the wave lengths is wanted. If much is used up in the leaves and stems there is less to go to the tubers, but the amount at any time in the leaves and stem relative to that in the tubers is so disproportionate it is perhaps of little importance. A dense foliage, however, makes leaves in the shade inactive as starch formers, and the more the leaves the better chance there is for the fungus.

Now, is it an altogether impracticable suggestion that experiments should be made in growing Potatoes in houses where conditions in accordance with our present knowledge could be under control? The full intensity of light could not in our climate be always secured, but over-intensity could be guarded against. Coloured glass is not now very costly. Cultivation in solutions of salts of different strengths and in different proportions is easily effected, and in pots soils of different and definitely weighed mixtures could be easily arranged.

It seems hardly rash to predict that different results would happen in different cases, and that different "habit" might in a few years be established with some degree of permanency. How long a habit might last when tubers so produced were used for cultivation in the open seems a very doubtful question. How long does any variety last? It has been said, at the outside not more than twenty years. That appears to be in the case of keeping on, year after year, taking from the open. But might not "breeding" keeping up the strain? It would be time to consider what points to breed to when the limits of control have been worked out. Supposing experiments proved that it was possible to lead to a habit of a few large or many small tubers who should decide the standard of a good Potato? A committee of cultivators, or of cooks? For boiling, steaming, baking, roasting, chipping, mashing, and the more mysterious elegant ways of preparing, known only to accomplished *chefs*, I am told different qualities are preferred. Probably there would be many standards. But the first thing is to learn how far we can control; then how far it is possible to induce habit; then to what extent that habit is permanent, and how conditions in the open change it; then whether any results arise sufficiently good to make breeding or rearing establishments under be control worth keeping up.

A question to which it seems at present possible to get but a very partial reply is, what happens to tubers during the time they are pitted or kept in cellars?

The principal fact that seems to be known is, that they lose weight. But why? What is it they lose? Is it that it is only water that is lost, *i.e.*,  $\text{H}_2\text{O}$ , which is contained as water in the tuber, and which can be driven off by drying?—or is it that the tubers, when first lifted, contain a glucose ( $\text{C}_6\text{H}_{12}\text{O}_6$ ) which gives up from each molecule  $\text{H}_2\text{O}$ , and so becomes an amyloid ( $\text{C}_6\text{H}_{10}\text{O}_5$ ) starch? The question probably has bearings on the difference between the "mealy" and "waxy" condition of a tuber.

As a preliminary step to answering the question, information might be collected in this way.

When a crop is lifted set apart a number of tubers for observation. They should be all from one part of the crop, so that the conditions under which they grow should be similar. They should also be of about the same size and weight. In crops on sloping land, where conditions of soil and drainage are different at the top and at the bottom, a second set might with advantage be kept. Each tuber should be numbered or in some way marked. Weigh and enter the weight of each tuber when first lifted, and at regular intervals weigh and record the weights. This would give the rate of loss of weight. To make the record of value the thermometer readings (highest and lowest, day and night) of the place where the tubers are kept should be registered. This would give loss of weight with regard to temperature. These observations would need regularly, but would give but little trouble. A record of the hygrometric condition of the air would add to the value of the observations.

Another set of observations that would be very helpful, though rather more troublesome, is on whether there is any change in the starch in tubers during keeping. All that is requisite is at fixed intervals to take a tuber, slice it, and treat it with iodine. The blue colour will show the area of starch. A record should be kept either by a pencil sketch, or, better still, by a photograph. The results will show, as in the woodcut from a photograph at p. 91, July 28. Different tubers, even from the same plot of ground, may, of course, somewhat vary at the outset, but the average results of a large number of observations would indicate the nature of the changes taking place. *W. S. M.*

## THE APIARY.

WE are having curious weather for the time of year. Rain has been very general, and probably in many cases beneficial, but not pleasant for us or the bees. If neglected before, do not fail to open the entrances to their full width now, otherwise the hives will probably get very damp. If bricks are used to stand hives upon, there ought to be pieces of slate between the bricks and the hives, otherwise the damp will ascend right through the bricks into the hives. We found this out once by painful experience, to the loss of a hive and a colony. Should the rain unfortunately be changed into snow, more care still will be required. The entrance must then be shaded, and the snow brushed off the covers every day.

The honey harvest in America seems to have been as bad, or worse than here, and from the United States we hear that they have never had such a bad year for a very long time. Let us hope that things are now on the turn. The present is a good time to be making preparations for another season, especially as regards frames and sections. It seems that in the near future wooden sections are to be more or less replaced by glass. For some time this has exercised the minds of beekeepers, but a totally satisfactory section seems to be a thing of the future. Our Scotch friends think it is not advisable to have glass sections too small, as the honeycomb looks so beautiful in them that they meet with a very ready sale. In Scotland for a long time past they have used a kind of glass frame bar holding 4 or 5 lb., and filled with heather honey, have found a ready sale.

These are days when the study of antiquities receives a large amount of attention. Bees have in all ages received a large amount of attention, but it is astonishing what mistakes were made by our forefathers about them. The Rev. John Thorley years ago said the princesses were not only "proclaimed queen, but crowned as well." While we read the following curious medical recipe in the *British Bee Journal* of this week, taken from a work printed in 1607:—"The hart of an ape, sod and dried, where of the weight of a great drunk in a draught of stale hunny sod (see the) in water called *melliteraton*, strengtheneth the heart, emboldeneth and driveth

away the pulse and pusillanimity thereof, sharpeneth one's understanding, and is sovereign against the falling euill." What would the modern physicians say to this? Echo answers, what? *Bee.*

## FICUS ROXBURGHII.

[SEE SUPPLEMENTARY SHEET.]

THE genus *Ficus* has been the occasion of late of considerable correspondence in the pages of our own and other periodicals by various writers, including Dr. King, the eminent Director of the Calcutta Botanic Gardens, and who has recently written an elaborate monograph of the *Species of Ficus of the Indo-Malayan and Chinese Countries*, published by L. Reeve & Co., London. Our illustration (see Supplement) is copied from the frontispiece to this work, and the tree, of which it is a picture, is now growing in the Botanic Garden at Calcutta.

This species of *Ficus* was named by the late Dr. Wallich in honour of the illustrious Roxburgh, for many years the Superintendent, and to a large extent the founder of the Botanic Garden at Calcutta, and the father of Indian botany. *Ficus Roxburghii* is a native of the lower and outer Himalayas from Nepal to Bhotan, being found at elevations of from 1000 to 3000 feet. It is a tree from 15 to 25 feet in height, and with a wide spreading head. The leaves are large, measuring from 1 to 1½ foot in length, and from 12 to 15 inches in breadth. The most striking feature in the tree is, however, the great abundance of its handsome russet-red Figs. These Figs in shape and size much resemble Dutch Turnips. They are carried in enormous bunches on the stem, especially near its base, and smaller bunches on the main branches. The mass of Figs borne at the collar of the stem on this singular tree at the time when it was photographed, weighed, as Dr. King informs us, about a hundredweight. It must, when in full perfection, have presented a remarkable spectacle, and one which would have produced a sensation at a fruit show in this country. The fruit, however, although eaten by the unfastidious Indian labourer, is quite unpalatable to a European being insipid and sloppy.

## PLANTS AND THEIR CULTURE.

**ARALIA AND PANAX.**—This is a group of plants chiefly characterised by their elegance, particularly as small plants; but when they attain larger size than can be accommodated in a 48-sized pot, they are not nearly so captivating; in fact, their general appearance becomes altogether changed. To give an example: the well known *Aralia reticulata*, when young, has long, narrow, almost linear leaves; but planted out in a cool greenhouse it soon begins to assume its adult habit of growth, and at 12 or more feet high the leaves will be from 4 to 6 inches in width, and a yard or more in length, and all other parts of the plant developed in the same proportion. The plant in this condition is very effective, altogether different from the same plant growing in a 48-pot. The same sort of metamorphosis takes place when *Aralia Veitchii* is planted out under like conditions, the individual leaflets soon measure an inch across, and other parts become correspondingly developed. This is merely a sample of what generally takes place, when these plants are allowed to develop, and shows the desirability of having them in a young state for most indoor purposes. Therefore batches of cuttings should be put in periodically. These plants are not nearly so difficult to propagate, as was at one time believed, indeed, many of them strike almost as freely as Willows. A frequent cause of failure results from the cuttings being kept too close and moist, such as would take place in a close propagating case, especially where much bottom-heat was applied. In such a position, unless the greatest care is taken in airing, shading and other details, damping off is liable to occur, but this

is due more to the cuttings being exposed to too much heat than to damping, in the ordinary sense of the term. That which I have found to answer best is a propagating case or frame, stood on some moisture-holding material, such as sand, sawdust, or cocoanut fibre refuse, in a position where the greatest amount of light may be had without the sun's rays falling directly on it. By so doing the evil of shading is altogether avoided; more air may be given, and watering is greatly lessened. A pit facing north, and a temperature of 60° to 65°, answers very well. If bottom-heat be employed it should be of a very gentle kind, not much exceeding the temperature of the house. But excellent results may be obtained by merely using a hand-light or bell-glass to cover the cuttings, not forgetting to arrange for a moderate circulation of air about the cuttings. I have always found it best to insert the cuttings singly in small pots (thumbs) filled with a sandy compost, and it is a good practice to place a pinch of sharp sand at the base, and around the cutting. As to the size of the cuttings, that will depend on the variety—free-rooting sorts like *A. reticulata*, *ilicifolia*, *Guilfoylei*, and *leptophylla*, may be taken of large size, remembering that 1 to 2 inches of stem above the soil is quite enough; if, however, cuttings are scarce, the stem may be cut into lengths of two or three joints, which, if they have leaves, will root as readily as tops; those without leaves should be planted thickly together in shallow pans; and this is also the method to pursue with root cuttings, but stems are to be preferred. In the case of *A. Veitchii elegantissima* and *A. V. gracillima* grafting is the readiest mode of propagation. Take rooted cuttings of *A. reticulata*, which makes the best stock, although *Guilfoylei* is often used; cut them over an inch above the surface of the soil, and graft by any method that is preferred. That which gives the least trouble is cleft-grafting, which is done by splitting the stem with a thin-bladed knife down the centre to the surface of the soil; cut the scion like a wedge, and insert it in the cleft, being careful that the bark (cambium) of both stock and scion exactly coincide, at least at one side; tie with a piece of bast, and stand the grafted stocks where water cannot touch them. A little *A. Veitchii* grafting wax is useful for them, but it is not absolutely necessary. A slightly drier frame than that recommended for cuttings would suit, but care should be taken that they do not damp off. In all cases tie up the leaves, otherwise they are apt to get broken. If well watered when put in, gentle dewings should, with judicious airing, suffice until the cuttings or grafts are well established. If *A. Veitchii* is grown in a greenhouse with a minimum temperature of 45°, it will stand much more hard usage, as well as remain of a suitable size for a longer period than when the plant is grown in a stove. *A. leptophylla*, *A. ternata*, *Pseudopanax crassifolia*, and *Panax Victoriae*, are all useful, and the last-named is a beautiful variegated plant, which likes an intermediate temperature. *Panax laciniatum*, *P. plumatum*, and *Elæodendron Chabrieri*, are desirable species and varieties, and they are easily increased from cuttings. For furnishing cold or exposed positions, *Aralia japonica* is very useful, for, being nearly hardy, it can be placed where other plants would succumb. There is also a variegated form of it, but it is reputed tender. Both are easily raised from cuttings, but seeds of the green ones are sometimes obtainable. The Rice-paper plant, *Aralia papyrifera*, is a bold, effective plant, but it is a coarse grower, with leaves dark green on the upper surface, and whitish underneath. Tall specimens with good heads of foliage make fine conservatory plants. There are several half-hardy species well worth growing. *F. Ross*, *Pendell Court*, *Blotchingley*.

## THE HARDY FRUIT GARDEN.

**MANURING.**—A general survey should now be taken to ascertain which are those fruit trees that stand in need of manure, as by so doing matters will be greatly facilitated; and then, on the first frosty morning, the manure may be wheeled to the different trees. Any Apple and Pear trees that are in the habit of carrying heavy crops yearly must be well looked after, for as the majority of these trees are grown on the dwarfing stock, they are soon exhausted unless well manured every year or two. It can generally be seen at a glance when trees are getting into a starved condition by the deterioration of the crop in point of size and quality; the fruits sometimes crack, and the trees make little or

no growth. Any trees which are in this condition should have the surface-soil removed to the depth of 5 or 6 inches, and then apply a good coating of manure equally all over the roots, after which 2 inches of the soil should be returned to the top of the manure, both to hold it down and to prevent birds from scratching it about. All bush fruit quarters are greatly improved by heavy dressings of manure, and for digging-in round the roots of red and white Currants and Gooseberries—well rotted farmyard manure is the best. Black Currant borders should have the surface-soil lightly pointed over, and then a good dressing of stable-manure, applied such as has been laying in the manure-yard for a few weeks, while for Raspberries old hot-bed material is without doubt the best stimulant they can have. Old-established Apple trees in orchards are greatly benefited by a surface-mulch of manure. This, if only placed on the turf, will do a great amount of good as the rains will wash the manurial properties down to the roots. The finest Blenheim Orange Apples grown in this neighbourhood are gathered from trees mulched with farmyard manure in this manner. Failing manure the turf on the surface should be dug in round about the trees with beneficial results.

The top-dressing and renovating of wall tree borders when required should receive attention, and the soil prepared so as to be in readiness. Sound loam well chopped, and the parings from the sides of roads and drives, to which may be added burnt earth, and wood ashes, all well mixed together, and placed in a heap for a short time before use, will form an excellent compost for the purpose. A small quantity of manure may be added for cordon trees.

**Bush Fruits.**—The pruning of these should now be done, but in districts where birds are troublesome, it is there best deferred till the spring. With regard to the pruning of Gooseberries, the purposes for which the fruits are required should be taken into consideration. A good general rule to follow is to leave rather more wood in those trees which are expected to furnish fruit for gathering in a green state, and for bottling purposes, than in those trees on which the fruit will be left to hang and ripen for dessert. Spur-in closely all cross shoots, and those not required for furnishing the tree; and remove a few of the oldest and under branches yearly, and leave a corresponding number of young growths to supply their places. These remarks apply also to red and white Currants, which should always be closely spurred in, and the branches kept well regulated and clear of each other. Black Currants do not require any spurring, but a good general thinning of the wood instead, removing as much of the old wood as is possible. A very good plan is to thin every other bush rather severely; this will induce them to break away, and make plenty of stout growths, which will bear exceptionally fine fruit the year after.

If cuttings of any of the above are required, select medium-sized, straight, well-ripened shoots, to the required number, tie them in bundles, label them, and heel them in under a north wall, until such time as they can be properly made. *A. Ward, Stoke Edith Park.*

## FRUITS UNDER GLASS.

**PEACHES.**—Under the genial influences of the mild weather, and with the assistance of the bed of fermenting leaves in the house, little or no artificial heat will have been required, and the buds will have made rapid progress. I find that the difficulty has been to keep the temperatures at 50° at night when the apparatus has been resorted to—by day 55° will be quite high enough when the sun is obscured, and in the intervals of sunshine 60° will not do harm. Ventilation must be afforded every day, and at the top of the house if possible, but more or less according to the state of the weather. Maintain a genial state of the atmosphere by turning a portion of the leaf bed and sprinkling it occasionally with tepid water. Allow the buds to get dry before darkness sets in, and as the blossoms expand advance the night temperature to 55°, and allow the flowers to get perfectly dry by the middle of the day; and pass over them a Pampas-grass plume to disperse the pollen.

**Succession Houses.**—The second house should be got in readiness if not already done; and it may be started about the end of December. Place a bed of

fermenting material in the house, as advised for that started early, and avoid frequent syringings. Let the necessary pruning and dressing be attended to in the later houses, and where red-spider and scale have been prevalent, let the trees be syringed thoroughly with protroleum and rain-water at a temperature of 90°. A 60-pot full of petroleum to 4 gallons of water will speedily loosen the scale from the shoots; and then the usual washing with a spoke-brush will destroy any eggs which may have remained. When using the brush keep the fruit-bearing shoot on the palm of the hand, and be careful to draw the brush up towards the point of the shoot. As each tree is scrubbed give another syringing with the mixture.

**Figs.**—The early trees, which were placed in a bed of fermenting leaves about the middle of November, will now be unfolding their leaves, and the young Figs making progress. If the temperature of the bed decline below 85° additional material should be employed to raise it to, but not to exceed that figure. At this stage the night temperature may be 55°, and the day temperature 60° if cloudy, and 65° with sun-heat. Syringe the trees with tepid-water on the mornings of fine days. Air the house daily when the weather is mild. Keep the roots in a medium state as regards moisture; and where the trees are not potted in the autumn, give frequent waterings with clear manure-water, and soot alternately.

**Succession Houses.**—The Fig trees may be put in readiness in the manner previously advised, cleaning, training, top-dressing as may be required. The trees will then be in a thorough state of readiness for the start at any period after the New Year. *W. M. Baillie, Luton Hoo.*

## THE KITCHEN GARDEN.

**PEAS.**—Seeds of these now germinating should be protected as soon as they appear by means of Spruce Fir boughs, about 18 inches long, placed on each side of the rows. When Spruce Fir cannot be obtained, Box, or Laurel, or Yew, may be used instead. A sharp look-out should be kept for mice, which do a great deal of mischief to Peas in a short time. Where cats could not be employed to reduce their number, Collin & Pullinger's patent traps have been employed with success. They should be kept clean and baited occasionally; one trap will often catch four or five in one night without any attention. Slugs are also troublesome in mild, showery weather, and it is well to put a few fresh-sifted coal-ashes on each side of the rows of Peas. The above remarks apply to Broad Beans also.

**Cauliflowers** in handlights and frames should have plenty of air at all times when the weather is mild, as any encouragement of growth at this season results usually in buttoning in the spring. Lettuces in frames should also have abundance of air in mild weather, and the larger plants be kept clear of decaying leaves, &c.; these and Cauliflowers also should have the surface of the soil stirred occasionally, and an occasional dusting with lime if slugs prove troublesome.

**Seakale and Rhubarb.**—A sufficient quantity of these roots should be prepared for forcing, and the earlier successions gradually brought on by keeping up a steady temperature of 55°–70°. Rhubarb is improved in flavour if the pit or house in which it is being forwarded is ventilated for a few days before gathering the stalks.

**Globe Artichokes.**—The stems and crowns of these plants should be protected before severe frost comes, by pulling away some of the older leaves and placing a heap of coal ashes, dry litter, or short straw around them. On the first indications of hard weather setting in, a plentiful supply of Celery, Brussels Sprouts, Savoy, Horse Radish, &c., should be got into the sheds, so as to be ready for use; and any roots of Parsnips or Jerusalem Artichokes remaining in the ground should be stored. Celery in rows outside should be covered with straw or bracken; Parsley protected by frames if possible, or by straw hurdles. Chicory roots should be dug up and laid in closely, ready for forcing as soon as the supply of Endive is exhausted, and any of the latter remaining outside should be protected from severe frost. *W. H. Divers, Ketton Hall, Stamford.*

Advertisers are specially requested to note, that, under no circumstances whatever, can any particular position in the paper be guaranteed for advertisements occupying less space than an entire column.

### APPOINTMENTS FOR THE ENSUING WEEK.

#### MEETING.

THURSDAY, DEC. 20.—Linnean Society.

#### SALES.

MONDAY,	DEC. 17.—Dutch Bulbs, at Stevens' Rooms.
TUESDAY,	DEC. 18.—Nursery Stock and Greenhouse Plants, at Protheroe & Morris' Rooms.
WEDNESDAY,	DEC. 19.—15,000 Lillium auratum and other Bulbs, Greenhouse Plants, &c., at Protheroe & Morris' Rooms.
	Roses, Fruit Trees, Shrubs, Border Plants, Dutch Bulbs, &c., at Stevens' Rooms.
THURSDAY,	DEC. 20.—Large quantity of Dutch Bulbs and English-grown Lilies, at Protheroe & Morris' Rooms.
	Lilium auratum from Japan, at Stevens' Rooms.
FRIDAY,	DEC. 21.—Sale by order of Messrs. F. Sander & Co., of Cypripedium Elliottianum, Cattleya amethystoglossa, and numerous other choice Orchids; also many Orchids in bloom, at Protheroe & Morris' Rooms.
SATURDAY,	DEC. 22.—Roses, Fruit Trees, Shrubs, Border Plants, Dutch Bulbs, &c., at Stevens' Rooms.

\***OUR ALMANAC.**—Secretaries of societies and others would greatly oblige by forwarding immediately, or as early as possible, to the Editor, notices of fixtures for the ensuing year, for insertion in the Almanac to be published in the first number of the new year. Communications should reach us not later than the 29th inst.

Mr. JOHN DAWSON, the Secretary of the Royal Horticultural Society of Perthshire, has done good service by publishing his address on the history of the Society, which dates from 1808, and which, therefore, may claim to be the oldest existing horticultural society in Scotland. It appears that the minutes and other proceedings of the Society are still in existence, and from them Mr. Dawson has compiled a very amusing and interesting history. The first show of which any detailed account remains was held on July 13, 1813, and consisted of Pinks and Lettuce, Melons and Strawberries, with three judges for each of these two groups. In order to prevent disputes and altercations the exhibits were looked up after the decision of the judges and not restored to their owners till after dinner. Harmony then prevailed and the members joined in the chorus "We'll rival the lads about Lunan wi' Flora, Pomona, and a'." A second show was held a month later, comprising Carnations and Cauliflowers only. In 1816 three shows were held, the first in April, for Seakale or Colewort, Broccoli, and Cucumbers, Polyanthuses and Auriculas; the second

in June, for Tulips, Ranunculuses, and Anemones; and the third in August, for Melons and Carnations. At this meeting the first mention of Roses is made; they were not, however, shown in competition on that occasion, though the specimens of seedling Roses then shown by Messrs. DICKSON & BROWN were declared to be worthy of the highest praise. Discontented exhibitors were not unknown in those days; indeed, they were proportionately more numerous then than now; and the Perth Society seems to have had no little trouble with one cantankerous exhibitor, who, year after year, made himself foolish, and proved a source of vexation to the Committee, till at length things came to such a pass that the President declined to receive any apology from him, or to remain a member of the Society with him; and we find the committee, with characteristic Scottish use of the future tense, expressing their regret that "one or two of the brethren are still determined that they shall not be pleased"—(the italics are ours); after which nothing more is heard of the discontented one for some time. In 1821 Turnips, Dahlias, and Hollyhocks were shown. In 1824 Carnations were distinguished at these shows into flakes, bizarres, and Picotees. In 1825 Lettuces were in like manner distinguished as Cos and Cabbage, while the Pansies of our days were foreshadowed by the Violets of that time. In 1831 the cantankerous exhibitor again appeared, but was disqualified, according to the record before us, because his collection of herbaceous plants included Gladiolus cardinalis, "which was held to be Liliaceous, and by the rule all bulbous roots were excluded." This seems to show that the botanical knowledge of the judges was somewhat at fault; at any rate, according to our present knowledge, there are three distinct misstatements in the rule we have quoted. Pelargoniums and Irises appeared for the first time in 1833, and in the summer show of that year Messrs. JACKSON & TURNBULL exhibited upwards of 300 named Roses and "a numerous assortment of Ayrshire and China Roses." In 1840 seedling Pansies and Larkspurs were shown, Campanula pyramidalis in 1844, and in 1848 an extra prize for Ferns—their first appearance at these shows. These extracts must suffice to illustrate what was done in the way of business. Refreshment was, of course, needed after work, and "the evening was spent in as friendly and entertaining a manner as the circumstances of the times would permit of." Some of the entertainment consisted of snuff, for which 2s. 6d. was paid. At this time the expenses of feasting were only 32s. 4d. less than the whole amount awarded as prize money. At present the more reasonable course of each member paying for his dinner is adopted, exceptions being made in favour of the judges, officials, and distinguished strangers. It would not be fair to Mr. DAWSON to reprint more of his pamphlet, which may be had from the Secretary to the Society, but we commend it to the notice of our readers, and hope the Society may long continue to "tend their flowers."

"Roses and Lilies and a',  
Daisies and Violets and a';  
See what a profusion of beauty  
And sweetness a garden can shaw."

**THE ROYAL HORTICULTURAL SOCIETY.**—Much needless alarm has been felt at the official statement made last week to the effect that as many as six members of the Council propose to resign their seats at the next annual meeting, the number comprising some of the most active and energetic of the Council. These resignations are taken in

some quarters as an indication of a divided policy, and a sign that the ship is really at last sinking. In point of fact, thanks to the gentlemen mentioned and their colleagues, the Society exhibits far more buoyancy than has been the case for years. Greatly as we regret the approaching resignations, and earnestly as we hope that some of them, at least, will be withdrawn, we deprecate any ill omen being deduced from what is a natural occurrence. Those who know what exertions have been made to place the Society on a better basis, and who are aware of the labour and time that have been expended in so doing, will feel no surprise that these gentlemen feel it incumbent on them to retire, at the end of a year of reconstruction, now happily largely effected. The marvel has been that men, so eminent, so heavily weighted with other duties, and so disinterested, could be induced to sacrifice so much for the benefit of horticulturists. It will be the duty of the Fellows at large to fill the vacancies; and though the task will be difficult, we have no doubt that it can be accomplished, but success will only be arrived at by unity of purpose and co-operation. Disintegration and dismemberment would simply ruin the Society, to the great detriment of horticulture. This tendency should, in the best interests of horticulture, be instantly checked, and one way of effecting this is by refraining from attaching a significance to the retirements from the Council, which is not justified by the facts of the case.

**MR. G. F. WILSON.**—The meeting of the Floral Committee on the 11th inst., was not only the last of the year, but was the last occasion on which Mr. G. F. WILSON will preside as Chairman, that gentleman having signified his wish to retire from the Council. Mr. WILSON has presided over the committee for many years with marked impartiality and courtesy, while his extensive knowledge of Lilies and herbaceous plants has always been at the service of the committee. Mr. WILSON has fairly earned the right to retire, as he has given up much time and labour to the service of the Society, and is one of the few amateurs who are sufficiently interested in horticulture to take an active part in the maintenance of the representative Society. The cordial thanks of all who know and appreciate the value of Mr. WILSON's services will be tendered to him, with the hope that he may for many years to come continue to take an active, if less responsible, part in the work of the Society.

**GARDENERS' ORPHAN FUND.**—We understand that Mr. A. J. BROWN, Honorary Local Secretary to the Fund for the county of Sussex, is, in co-operation with Mr. HALL, Lord BOLTON's gardener, making arrangements for an entertainment in aid of the funds of the above charity.

**DEVON ROSERY GARDENERS' RELIEF FUND.**—We are requested by Messrs. CURTIS, SANDFORD & Co., Torquay—who, it will be remembered, were the originators of the Fund—to call attention to the fact that there is one bed vacant at the convalescent home there for gardeners from the North. The home is free, but the committee think that the gardeners' employers should be asked, and would, no doubt, be willing to contribute to the Fund; but this is not a *sine quid non*.

**PARIS INDUSTRIAL EXHIBITION.**—We have received from M. Charles Baltet, the President of the Jury, a list of awards made at the Paris Industrial Exhibition to English exhibitors in the section of perry and cider. For collections of fruits, a Gold Medal to Messrs. R. Veitch & Sons, Exeter; Silver-gilt, to Mr. J. Watkins, Hereford; Silver, to Mr. Jones, Ledbury; and a Bronze Medal to Mr. Ham, Exeter. Messrs. Bulmer & Co., Credenhill, Hereford, was awarded a Gold Medal for perry; and a Silver-gilt and Silver to Mr. Watkins and Mr. Jones, Hereford, respectively. For cider, Messrs. Bulmer and Mr. Ham each received a Silver-gilt Medal; Mr.

Bosley, of Devonshire, a Silver Medal; and Bronze ones were accorded to Mr. Watkins and Mr. Jones.

**BOOKS OF THE SEASON.**—Among the many useful manuals issued at this season, two which are greatly valued by gardeners, and which now lay before us, are the *Horticultural Directory and Year Book*, published at the office of the *Journal of Horticulture*, 171, Fleet Street; and the *Garden Annual and Almanac*, published at the office of the *Garden*, 37, Southampton Street, Strand, W.C. A handy strong pocket-book and diary is issued by J. WEEKS & Co., the horticultural builders, of King's Road, Chelsea.

**DISA LACERA VAR. MULTIFIDA.**—It having been stated in Mr. Brown's note on this plant in our last issue that the engraving was taken from a plant grown by Mr. F. W. BUNNIDGE, Trinity College Gardens, Dublin, that gentleman writes to disclaim the honour of having done so, stating that this is due to Mr. BEDFORD, gardener at Straffan House, Co. Kildare.

**PHYLOXERA LAWS IN RUSSIA.**—In order to protect Vines in Russia against the introduction of the Phylloxera, the Minister of the Interior, in conjunction with the Minister of Finance, has found it necessary to modify as follows the law relative to the importation, to Russia, of living plants, fruits, and vegetables:—

Article 1.—The importation, into Russia, of living plants (except Vines) coming from Germany, Belgium, Holland, Denmark, England, Sweden, and Norway, is permitted at the following frontier stations of Wiertzobolov (Wirballen), Alexandrovo, and Mlava; at all the White Sea ports, and also three of the Baltic, at Libau, Riga, and St. Petersburg; and at the Black Sea ports of Odessa and Batoum.

Article 2.—Consignments of living plants should be accompanied with certificates from the local authorities of the countries from whence they come testifying: a, that the packages do not contain Vine plants; b, that the individual or business-firm sending the plants is not engaged in Vine culture.

Remark 1.—Consignments of living plants will be delivered by the customs-house authorities to the consignees, if these packages be proved by written attestation not to contain Vine plants.

Remark 2.—The Imperial Botanic Garden of St. Petersburg and the Imperial Universities have the right of importing living plants from all countries without producing the aforementioned affirmations. These importations must be authorised by the Finance Minister for the Botanic Garden on the requisition of the "Minister of Domains," and for the universities by the mutual consent of the Finance Minister and the Minister of Domains, provided that the universities fulfil the obligations imposed by Article 1277 of the Custom-house Rules.

Article 3.—The introduction of foreign Grapes of all descriptions, and *marc* of Grapes, is authorised through all custom-houses through which living plants can be imported, with the exception of the port of Batoum.

Remark 3.—Grapes sent from abroad must not be packed in Vine leaves.

Article 4.—The importation of fruits and vegetables of all species from foreign sources is authorised at all the custom-houses with the exception of those on the south-west frontier of the country, as far as, and including the custom-house of, Volotchisk.

Article 5.—The present law shall be in operation two months after its publication; that is to say, on November 24 (December 6).

**TULIPS AT THE PARIS EXHIBITION, 1889.**—In the last week of November the firm of E. H. KRELLAGE & Son, Haarlem, Holland, planted in the Horticultural part of the Paris Exhibition six beds, each having an area of about 225 square feet, with late Tulips selected from their new collection of breeders. A large number of the tulips are of the most diverse

and splendid colours, and in more than 700 varieties. Messrs. KRELLAGE are the first foreign exhibitors whose exhibit is already installed. The Tulip beds have received a place of honour in the large grass plot which surrounds the fountain in front of the Palace of the Trocadero. These bulbs, flowering usually about the middle of May, may be expected to be in bloom at about the time fixed for the opening of the Exhibition.

**THE SEASON.**—At one of the towns on the Kentish coast this week we noticed as still in bloom Roses of several kinds, Daisies, Pansies, Hollyhocks, African Marigolds, French Marigolds, common Marigolds, Marguerites, Godetias, Fuchsias, Clarkia, Silene pendula, Saponaria ocyoides, Chrysanthemums carinatum, in several forms, Convolvulus minor, Iberis amara, Wallflower, Rockets, Veronica Andersoni, and others; Antirrhinum, Mignonette, Centaurea Cyanus (Corn-flower), Poppies (P. somniferum), Larkspurs, Eschscholtzias, Coreopsis, Collinsia bicolor, Nigella, blue Nemophila, blue Passion-flowers, Pelargoniums, Tamarisks, Ligustrum ovalifolium, Primroses, Auriculars, Tritonias, Hydrangeas, and, of course, ordinary Chrysanthemums—these latter vigorous, full of bloom, and with a richness of colour which is conferred by sea air only. From Cornwall, on the other side of the kingdom, Mr. BOSCAWEN sends us blooms of the Lemon-scented Verbena (Aloysia), of JACKMAN'S Clematis, Solanum jasminoides, Rhynchospermum jasminoides, while a turkey hatched a brood of nine beneath an Abies Nordmanniana—certainly a very unusual occurrence at this season. From Mr. H. HARDY, Bures, Suffolk, come flowers of many various kinds of plants gathered in the open air, and which were mostly fresh and quite unblemished. We remark in the collection before us, Indian Pink, Rudbeckia, Sweet William, Hollyhock, varieties of Calendula, Carnations, Pansy, Stocks, and others more or less tender.

**COSMOS BIPINNATUS.**—Although introduced in 1799, this pretty half-hardy annual is very seldom grown in this country, and is but little known. The seed may be sown in the open border in April, and it will eventually grow to about 3 feet high, bearing a quantity of claret-coloured flowers similar to single Dahlias in form and size, the finely cut foliage adding greatly to the distinct and pleasing character of the plant.

**SMITHFIELD CLUB SHOW.**—This annual event opened on Monday, December 10, at the Agricultural Hall, Islington, and the usual complement to the show of live stock—which, by the way, was larger than in the previous year—was made by the seed trade which had large displays of Mangels, Swedes, Kohl Rabi, grass seeds, seed corn, Potatoes, &c. We remarked in the galleries stands of these farm products set up by Messrs. Gibbs & Co., whose specimens of Robinson's Oxheart Cabbage were very fine; and the various fodder grass plants shown in the dried state. A small stand of roots, seeds, &c., was exhibited by Messrs. Oakshot & Millard, of Reading; that of Messrs. Webb & Sons, Kinvor, Stourbridge, was of great extent, and was arranged as a bank rising from the floor to a height of 15 feet—roots of various kinds were the most important items on this stand; although farm seeds were likewise largely shown, including fine samples of Kinvor Chevalier Barley and Challenger Wheat. Messrs. Raynbird, Caldecott, Bawtry, Dowling & Co., Basingstoke, showed an excellent lot of cereal and other seeds, roots, &c. The exhibit of Messrs. Carter & Co., Holborn, of roots and seeds was very extensive, especially the sections of grass seeds and Potatoes, Carter's Imperial Globe Turnips were remarkable for size and fine form. A smaller stand was set up by Mr. John King, Coggeshall, Essex, consisting of Potatoes, Kohl Rabi, and other field roots. Messrs. Sutton & Sons, Reading, had their usual large stand well filled with fine specimens of all the kinds of roots grown on the farm;

large quantities of seeds of all kinds, with special grass mixtures for certain kinds of soil. Their Intermediate Carrot is a very superior strain. Messrs. Harrison & Son, Leicester, showed a stand of farm seeds and roots, and a very fine strain of Leek. Forest trees, grasses, and the new hedge plant, the Cherry Plum—Myrobellia is the trade name—were exhibited by Dicksons (Limited), Chester, and, lastly, the Agricultural and Horticultural Association made an interesting exhibit of roots of all kinds, seeds, manures, feeding stuffs, &c.

**THE NEW VEGETABLE.**—A name is wanted for the tubers of *Stachys tuberosa*. The name used in the Paris markets is *Crosnes*, from the locality whence they were introduced into the market, and which would be pronounced as if written *Crones* in English. Old *Crones* is not a complimentary epithet for a new vegetable of such merit. Messrs. CARTER, we see, adopt the name Chinese Artichoke, which would be appropriate but for the fact that they are neither of Chinese origin, nor are they Artichokes. Why not call them *Stachys*?—not a very difficult word to pronounce.

**LYCIIUM BARBARUM AS A SEASIDE PLANT.**—For holding up slipping banks there are few plants to surpass this. It forms a profusion of long, thin, underground runners, which interlace, and from which are sent up a profusion of leaf-buds, which form new plants. This is another instance of a plant, native of a warm temperate, or even subtropical country, which is nevertheless hardy here, like the blue Passion-flower of Brazil or the Tritomas of South Africa.

**NEW USES FOR MEXICAN FIBRE.**—It is stated in the October number of the *Brushmaker*, that Mexican fibre, or Ixtle (Agave heteracantha), which has of late been so largely used for scrubbing and nail-brushes, has, for many years past, been also used in the manufacture of corsets, principally in Norfolk, Suffolk, and Essex, especially in the very large factory at Haverhill in Essex. It is also said to be woven into cloth suitable for window-blinds, screens, &c., and in hot climates, when it is used to keep the doors and windows open at night, these blinds would be very useful. Quite recently the fibre has found favour in unexpected quarters, as it is now being very largely used in the manufacture of artificial flowers. Notwithstanding these uses, and others which may yet be found for it, the great demand for it is still for brushmaking—a demand that is increasing both in this country and in every part of Europe.

**THE NATIONAL AURICULA AND CARNATION AND PICOTEE SOCIETIES.**—A largely attended meeting of the committee of the London Societies took place, by the permission of the Horticultural Club, in their rooms at the Hotel Vendôme, on Tuesday, the 11th inst., the Rev. H. H. D'OMBRAIN in the chair. The minutes of the last meeting having been read, it was resolved that the offer of the Council of the Royal Horticultural Society, to give the sum of £10 to each of the Societies, be accepted; and it was arranged that the exhibition of the National Auricula Society should take place in the Drill Hall, Westminster, on Tuesday, April 23, in connection with the meeting of the Royal Horticultural Society on that date; and that of the National Carnation and Picotee Society on Tuesday, July 23, also in conjunction with a meeting of the Society. The Council having expressed a desire that something in the form of a conference should take place at each of the shows, having reference to the particular flowers exhibited, by way of imparting additional interest to the Society's meetings, a sub-committee, consisting of the Rev. H. H. D'OMBRAIN, H. SELGE LEONARD, R. DEAN, and J. DOUGLAS was appointed to make the necessary arrangements, and report at a future meeting of the committee. The schedule of prizes offered at the exhibition of the National Auricula Society was passed in the form in which it appeared at the last

show, and a few alterations were made in that of the Carnation and Picotee Society. It was decided that yellow-ground flowers be no longer shown with selfs and fancies, as there is a class for them; that for twelve blooms was reinforced by one for six blooms, it being understood that yellow selfs can also be shown as yellow-ground flowers. Mr. DOUGLAS having drawn attention to the fact that there is in the hands of the Treasurer a balance from the two Societies amounting to £40, suggested that a portion of this should be invested as a reserve fund, and eventually it was agreed that £25 should be set apart for the purpose of forming a reserve fund, it being left to the Rev. H. H. D'OMBRAIN, H. S. LEONARD, and J. DOUGLAS, to make the best investment they could. The proceedings closed with votes of thanks to the Horticultural Club, and also to the Chairman for presiding.

**THE PRODUCE OF CORK IN SPAIN.**—The Cork trade in Spain seems to be in a flourishing state. The exportation to other parts of the Continent, as well as to England and America, was greater last year than it has been for several years past. It is stated that there has been the greatest demand for the superior kinds of corks, such as those for champagne bottles. Gerona is the most important centre in Spain for the production of cork, hundreds of cork manufactories being scattered over the province. In the town of Palamos alone there are forty, and the exportation thence is considerable. From St. Felin de Guixols (Gerona), it is reported that the Cork trees have been suffering from the attacks of a pest which threatened to destroy them. A voracious caterpillar or worm has, it is reported, been attacking the Cork forests in millions during the past year or two. In a very short space of time it stripped the trees of all their leaves from the tips of the branches to the trunks. These worms are now in their turn said to be attacked and devoured "by another insect, a species of beetle of a dark green colour, and armed with a horn, with which it cuts the worms up. Another insect, in the form of a crab (*cangrejo*), pursues the worms, and destroys them; and thirdly, when the caterpillar has passed through its metamorphosis, and the butterflies have deposited their eggs, another insect, until now unknown, attacks and pierces the bags containing the new genus, and destroys them; all of which will contribute, no doubt, to the complete extinction of these destructive caterpillars."

**MILDNESS OF THE SEASON.**—Mr. TOMKINS, writing December 10 from St. Mary, Scilly Isles, says:—"In consequence of the mildness of the season Narcissus are in a very forward state, from Early Paper White to the late-flowering varieties. Here and there may be seen a stray bloom of Early Paper White and Soleil d'Or; should the weather continue fine Covent Garden will in all probability receive consignments during the first week in January. I am cutting from the open ground Christmas Roses, white Arums, and Freesias."

**THE EDINBURGH CHRYSANTHEMUM SHOW.**—Notwithstanding the inclement weather which prevailed on both days of the above show of the Scottish Horticultural Association, it is gratifying to find from an informal report to the Council by Mr. McKENZIE, the Treasurer, that the receipts cover the expenditure, and leave a few pounds of a balance in favour of the show.

**ROYAL CALEDONIAN HORTICULTURAL SOCIETY.**—The annual meeting of this Society was held in a side room of the Music Hall, Edinburgh, on the 6th inst., H. H. NORRIS, Esq., Coltbridge Hall, in the chair. The attendance of members was larger than usual in recent years. The minutes of the last annual meeting having been read and adopted the Treasurer—Mr. NEILL FRASER—gave an abstract of the accounts for the year ending November 30 last. The total receipts for the year

were shown to have been £1258 3s. 10d., and the payments £1002 18s. 6d., leaving a balance in favour of receipts of £255 5s. 4d. The funds on hand on November 30 last were £1117 12s., being an increase on the previous year of £238 13s. The report was approved. The Marquis of LOTHIAN was unanimously re-elected President of the Society for the year. Sir JAMES GIBSON CRAIG, on the recommendation of the Council, was elected Vice-President in the room of the Earl of STAIR, retiring from the office. To fill the vacancies on the Council created by the retiring members—Mr. JAMES ALEXANDER, nurseryman; and Mr. McLEOD, gardener—the names of Mr. JOHN METHVEN and Mr. JOHN LAMONT were put up for the former, and those of Mr. MALCOLM DUNN, Dalkeith, and Mr. GORDON, of Niddrie, for the latter vacancy; but as both Mr. LAMONT and Mr. DUNN declined to have their names put to the vote, Mr. METHVEN and Mr. GORDON were duly elected. The meeting terminated with a hearty vote of thanks to the Chairman.

**SEEDLINGS OF SUGAR-CANE.**—The Sugar-cane has been cultivated for so long a period that its native country is unknown. BENTHAM states that "we have no authentic record of any really wild station for the common Sugar-cane." Further, according to the *Kew Bulletin* for December, the Sugar-cane so rarely produces mature seeds that no one appears to have ever seen them. In botanical works the subject is often mentioned, but apparently only to restate the fact that observers in all countries "have never seen the seed of the Sugar-cane." The authorities at Kew have been working at this subject for several years. It was felt that if a Sugar-cane producing ripe seeds could be found, a most interesting and important line of inquiry would be opened for improving the saccharine qualities of the Sugar-cane in the same way as that so successfully adopted with regard to the Beet. Hitherto the Sugar-cane has been reproduced under cultivation solely by means of buds and suckers. The improvement of the cane has therefore been restricted to chance variations occurring at wide intervals, and probably escaping altogether the observation of the planter. Now all this is likely to be changed. It appears that at Barbados seedlings of Sugar-canes have been successfully raised by Professor HARRISON, and among these seedlings are several different kinds indicating hybridity of a definite sort, such as would be expected to arise from the crossing of different varieties. It is to be hoped this subject will be fully and clearly followed up as a definite field of investigation. In any case the possibility of improving so important and valuable a plant as the Sugar-cane possess general interest.

**THE SCOTTISH PRIMULA AND AURICULA SOCIETY.**—This Society held its second annual meeting in 5, St. Andrew Square, Edinburgh, on the 6th inst. Mr. MALCOLM DUNN occupied the chair. The Secretary and Treasurer, Mr. WILLIAM STRATON, Dundee, submitted his report for the year, which was in every way satisfactory, there being a balance in the Treasurer's hands of £10 4s. 6d. to the Society's credit. The question whether in the light of the experience of the past two shows, in which the classes were open to all comers, a reconstruction of the schedule should not be determined upon, so that growers in late and unfavourable localities may not find themselves pitted against those from the southern and favourable districts, was discussed, and the feeling of the meeting being in favour of some such alteration, it was remitted to the Council to fully consider and give effect to the matter in next year's schedule. The date of the show for next year was fixed for May 9, and the meeting closed with a cordial vote of thanks to the Secretary and the Chairman.

**CLERODENDRON NUTANS.**—This is a white-flowering kind, not generally catalogued in gardening books, but it should be grown in all stove collections. It is much admired, and coming into flower during the months of November and December makes it all the more appreciable.

## NOTICES OF BOOKS.

**THE PRINCIPLES OF AGRICULTURAL PRACTICE AS AN INSTRUCTIONAL SUBJECT.** By JOHN WRIGHTSON, &c. (Chapman & Hall.)

This work embodies the substance of a course of lectures given to science-teachers with a view to show them that the principles of agriculture are capable of being taught in the lecture-hall or the school-room, although agriculture, as the author tells us, is an occupation requiring experience for its successful prosecution. This is, of course, quite true, but the value of the experience, and the power of applying it to useful ends, depend very materially upon the training that the farmer has had in the principles of his art as well as in the practice. The book before us is peculiar in its object. It is not professedly concerned with the teaching of agricultural principles, though in point of fact it does teach a great deal of them. It is rather designed to instruct other people how and what to teach. For this purpose the experience of a teacher, a farmer, and an examiner, must needs be of value, and Professor Wrightson combines all the requisites; for instance, he is in an excellent position to show in what degree chemical analysis is valuable to the farmer or gardener, and in what respects it is worse than useless. The analysis of the ash of plants, upon which so much stress is laid by chemists, is really of very secondary importance to the cultivator, inasmuch as it shows rather the results of cremation than the composition, still less the action, of the living plant. An ordinary science-teacher, fresh from the chemical laboratory, is not likely to recognise this, and he might, from his point of view, recommend silica as a manure for Wheat, or nitrogenous fertilisers for Clover, though, from a practical point of view, very unnecessarily so. So, too, a teacher, fresh from the lecture-room, might easily fall into the prevalent notion that weeds are wholly objectionable, when, in point of fact, they are valuable as indicating a highly fertile soil: weeds will not grow luxuriantly on a poor soil, and the farmer may judge by their presence and condition of the quality of his soil. It is his business either to substitute some other plant for the weed, or, if he can, to turn the weed itself to account, and thus avail himself of the richness of the soil to useful instead of useless purpose. With reference to this point Professor Wrightson tells us that the presence of Bracken is a good sign while that of Heath is a very bad one, but it may be pointed out that the two often grow together, and, moreover, the presence of the Heath does not necessarily indicate a bad soil, but only a soil ill-adapted for plants which are not provided with the very fine fibrous roots which are characteristic of Heaths. Incidentally we may mention with reference to the suitability of particular soils for particular plants a remark made by Mr. Wrightson that *Trifolium incarnatum* "will not grow at all upon white chalky soil." We will not presume to question the general accuracy of the Professor's dictum, but it is certainly within our knowledge that the plant is sometimes grown on the chalky hillsides in Kent, both near to and at a distance from the sea, and that, to all appearance, it thrives as well as its near ally, the Saintfoin.

In dealing with the subject of grassland Professor Wrightson points out that it often happens that the seeds swept up from the hayloft often produce more satisfactory results than more expensive purchased seed. This may well be, for the seed is probably all new and good, it is native of the soil, and it is mixed with other seeds, producing an association of herbage, if we may so speak, which is but imperfectly imitated by the seedsman. There is, we are convinced, much in the association of particular plants in pasture, and particularly in meadow-land, which is not yet appreciated either by the botanist or the farmer. From this point of view the weeds found in pasture-lands may not be all evil. In certain seasons and under certain circumstances they may protect and shelter young seedling grasses and

Clovers at critical times; they may afford food for slugs and insects that would otherwise prey on the grasses, and in a variety of ways they may prove beneficial rather than the reverse. These things are matters requiring observation. The great value of scientific training for cultivators of the soil seems to be that it affords a broader and more varied basis for the experience of the practical man to work upon.

Routine practice has, of course, much in its favour as the outcome of experience; but that experience is much too limited in its range, and while it is not calculated to further progress, still less is it adapted to new conditions and altered circumstances. Professor Wrightson's work reads like a series of essays rather than a continuous treatise; but, in any case, it is one which we can most cordially recommend to the attention of the thoughtful cultivator.

**THE BOOK OF THE FARM.** By Henry Stephens. Fourth edition, by James Macdonald. (Blackwood & Sons.)

The fact that this standard work now reappears in a fourth edition is a sufficient guarantee that it is adapted for the purpose it was intended to fulfil. Moreover, the editor tells us that he has carefully revised the greater portion, while some part of the book has been entirely re-written. The eminently practical spirit in which the work is conceived will commend itself to many. It is divided into three heads—Initiation, or instruction in first principles; Practice, detailing the entire series of operations on the farm, whatever be its nature; and Realisation, under which are included the details concerning the stocking of the farm and the various financial transactions connected with it, comprising, we presume, the art of marketing. The volume before us opens with a statement as to the different kinds of farms, and the duties of the several persons who conduct its business. Then follows a section on the sciences applicable to agriculture, occupying some twenty pages, and therefore, as may readily be surmised, meagre in the extreme, the section relating to botany occupying about three columns; while the subject of germs is dismissed in a dozen lines, and under the heading, "Productions of Nitrates in Soils," not one word is said as to the action of the aforesaid germs. Such cursory treatment of the general principles upon which all cultivation, whether of animals or plants, depends, is, it must be admitted, unsatisfactory; but it must not induce the reader to suppose that the other portions of the volume are treated with equal inadequacy. On the contrary, the explanations are full and clear, and the precepts excellent.

## TREES AND SHRUBS.

### ESCALLONIA MACRANTHA.

This beautiful flowering shrub is frequently met with as a wall plant, and in that form it has no chance of showing its floriferousness, such as is the case when growing unrestrained. The other day, when passing Battle station, we noticed a specimen which had been planted against a low wall, but owing, I suppose, to want of time or knowledge, the plant had long since been allowed to outgrow its original boundary, and had risen much higher, as well as taken possession of a part of the opposite side of the wall. The plant was flowering very profusely. Its long racemes of red flowers, backed by the bright green foliage, had a peculiarly graceful effect. We thus had an opportunity of seeing this fine old shrub in finer condition than usual. *F. R.* [The shrub in question is twenty years old. For sea-side planting it is highly to be recommended. Ed.]

### ATHROTAXIS (THE JOINTED YEW).

This is a very interesting genus of small trees or shrubs, natives of New Zealand, and as they occupy but small space, and are very distinct in character and appearance from other ornamental plants, on

this account they are well worthy of the attention of amateurs and others who possess places of small extent.

*A. cupressoides* I have found to be the hardest and the easiest grown of any of the group; and although all of them are improved by shelter, yet this species in particular should never be confined, as it is apt to get drawn up, and then presents a slender lanky appearance. When properly grown it is a very ornamental plant, and is well furnished with branches, which are often divided into threes, and occasionally forked. The leaves are of a glossy-green colour, without footstalks, imbricated, and lie close to the twig or branch. It seldom requires pruning, with the exception of cutting back or pinching out the terminal bud, or cutting off a rival leader at the top when it occurs. All the species like a rich free open soil, thoroughly drained, well trenched, broken up and pulverised to a depth of about 20 inches. Strong adhesive clay soil is inimical to their proper growth; therefore, when it is desirable to plant a specimen on such soil, the site should be prepared for it by adding to and mixing a quantity of bog-earth or other loose material with the staple, so as to render it more genial. On the other hand, light sandy soil should have a quantity of clayey loam incorporated with it. When planting the trees the roots should be carefully spread out in all directions from the base of the stem, covered with fine soil, and finished in the ordinary way. I need hardly say that the plants should be protected from rabbits and vermin of every kind, and I have found it an advantage to stick a few Spruce Fir branches into the ground around the plant, to afford additional shelter until such time as the roots become established.

*A. lasifolia* (the loose-leaved Jointed Yew).—This is not such a free grower as the former, but where it thrives it forms a pretty little specimen bush, whose proper place is the lawn. The leaves are rather thick and fleshy, sharp-pointed, and of a yellowish-colour, and stand out from the branch or twig. The lateral branches often assume a pendent habit, rendering the plant still more interesting. It may be planted with success in closer and more shady places than *A. cupressoides* will endure, as it is not so apt to be drawn up under such-like conditions.

*A. selaginoides* (the Cypress-like Jointed Yew).—This pretty little tree is said to attain a height of about 30 feet in its native habitat, but in this country it is of very slow growth, and even under the most favourable circumstances as regards soil, site, and shelter, it only attains the size of a small bush. Its habit of growth and general contour are quite distinct, and those who have a partiality for variety and have but limited space, should give it a trial in a sheltered situation. Under favourable conditions it has an upright habit of growth, and is generally well furnished with flexible twigs and branches of a lively green colour. These plants are seldom to be seen even in first-class collections, which may be partly accounted for from the fact that their hardness cannot be depended upon when planted on exposed places or at high elevations above the sea-level. I have been enabled to grow by far the finest specimens of these trees in Ireland, where the climate is milder, frosts less intense, and of shorter duration than in this country; notwithstanding which, there are many parts of this country where its successful cultivation would be a certainty. *J. B. Webster.* [We have ventured to alter the names given by the writer, in conformity with the results of our investigations into the botany of the genus. See Nov. 10, 1888, p. 545. Ed.]

### SAMBUCUS RACEMOSA.

Whether it be owing to climate, or whether this species is more commonly planted in the North than it is in the South, its bright scarlet fruits are very rarely seen in South-country gardens. Whatever the reason for this, there can be no doubt about its ornamental value as a bright-coloured autumn-berried shrub; and of this I was reminded recently when visiting the gardens at Crathes Castle, Kincardineshire, where in a recently formed shrubbery it was observed in fine condition. The plants had been well cut back the previous year, and the sturdy growths which they had made this year bore

clusters of brilliant red fruits, which were all the more conspicuous as the early frosts had nearly stripped the plants of their foliage. *F. Ross.*

## FLORISTS' FLOWERS.

### NEW CHRYSANTHEMUMS.

It is high time the English growers of Chrysanthemums, and especially those who cultivate for exhibition, should enter a protest against nearly, if not quite, all the so-called new and incurred varieties being sent to this country from France and America. The one exception to the general condemnation is Delaux's *Perle Précieuse*, sent out in 1887, and considered to be good enough to be included in the last edition of the National Society's Catalogue. It is there described as rose-purple, with a silvery back to the florets, which are broad, and of medium size, and a mid-season variety. It is a very pretty variety, with a broad solid petal, of good form, but does not come large enough to be included among the exhibition flowers. The French raisers appear to be coming round to the conviction that the long lists of Japanese varieties they have been announcing for years past—so many of them being of only second-rate quality—are no longer bought up so eagerly as they once were by our growers, and they seem to be turning their attention to the incurred species; but as yet with indifferent results. Another danger threatens the grower, that of some exhibitors renaming imported flowers. A strong protest was entered against the practice at the meeting of the Floral Committee of the National Chrysanthemum Society on the 21st ult. This is, indeed, a misleading and unjust proceeding, which cannot be too strongly condemned.

The recently-published Catalogue of the National Chrysanthemum Society contains a list of eighty incurred varieties, more than one-fourth of which have originated as sports. Indeed so sportive is the Chrysanthemum, that of recent years we have obtained finer incurred forms from sports than from seedlings. Three new forms in this section are announced for distribution in the spring of next year—all sports; they are Miss M. A. Haggas, which gives exhibitors what they have desired to obtain—a golden Princess of Wales. This sport came from Mrs. Heale, which is itself a very fine pure white sport from the delicate rose-tinted Princess of Wales. The second is H. Shoemith, a bronze-coloured sport from the well-known golden Mr. Bann, which in its turn is a sport from Golden Beverley, being much deeper in colour, and a favourite early variety. Lastly is Miss Violet Tomlin, which gives us a companion to the purple-coloured Refulgens, but a much more reliable flower for exhibition purposes. Refulgens, though of a fine tint of purple-maroon, is invariably small, and frequently comes with an open centre. The new form is a sport from Princess of Wales, and is of a bright purple-violet shade, and quite as fine.

Exhibitors of Chrysanthemums now possess three valuable groups of incurred Chrysanthemums most useful for show purposes. They are the "Queens," under which heading may be placed Alfred Salter, Bronze Queen of England, Emily Dale, Empress of India, Golden Empress of India, Golden Queen of England, Lord Alcester, and Queen of England—a group which gives the largest and finest back-row flowers of the incurred section. Then Princess of Teck gives a smaller but scarcely less useful set; they are—Charles Gibson, Hero of Stoke Newington, Lord Eversley, and Mrs. Norman Davis. Now we have a third series, of which Princess of Wales is the original type. They are the new varieties described above, viz., Miss M. A. Haggas, and Miss Violet Tomlin, Mrs. Cobay, and Mrs. Heale; while another fine sport is promised for next season.

It has been suggested that it would add a new interest to our Chrysanthemum exhibitions if prizes were offered for the members of these different

groups. The National Chrysanthemum Society might fitly comprise such classes in its schedule of prizes for 1889, only that the schedule appears to be already sufficiently bulky. *R. D.*

#### THE YELLOW PICOTEE AND CARNATION.

A notion prevails that these choice plants are more difficult to cultivate than other varieties of the Carnation and Picotee. Probably years ago this might have been the case; and even in recent years some varieties have been found with a delicate constitution, while others are more robust. My own experience extends to something like thirty years, and within those years the earliest known to me, which I was also able to cultivate, were Prince of Orange (Perkins) and Ascot Yellow (Standish). These two varieties I obtained at one time, and the first named was an illustration of a vigorous growing variety, and one which kept up its vigour until now; whereas the Ascot Yellow, though vigorous at first, speedily declined, and I believe it has now gone out of cultivation.

Some fifteen years ago Mr. Charles Turner, of Slough, raised about 250 seedlings from Perkins' Prince of Orange. It was a sight not soon to be forgotten to see that lot of seedlings in flower, and a selection of them was sent out, after being exhibited in capital form at the various London exhibitions. I allude to them because we obtained a number of the best varieties when they were sent out, and had a good opportunity to study their character as regards constitution. Most of them were vigorous, but a few were not so, and very difficult to increase.

Seedlings have been raised from the vigorous growing varieties, and an advance has again been made, both in quality of the flowers and vigour of constitution. The point for raisers to attend to is to raise plants that will grow well out-of-doors, and make useful border plants. The varieties of fifty years ago were weakly constitutioned, as we learn from Hogg, who writes, in his *Practical Treatise*, that "The yellow Picotee is at all times a difficult flower to grow in this country, on account of our moist atmosphere and long winters. The Dutch florists have had success with it for the same reason." Hogg gives a coloured plate of a yellow Picotee in his treatise; but it is a fringed edged thing, flaked with crimson, and well marked with red lines. An earlier plate of a true yellow Picotee, raised by Hogg, is figured in the *Floricultural Cabinet* for the year 1835. It is named *Publicola*; the ground colour is deep yellow, with a heavy scarlet edge, but those early plates are not very truthful. Many varieties were grown by Hogg, all of which are now lost to cultivation.

A grower in the Midlands, of the name of Smith, greatly improved the yellow Picotee after the death of Hogg. Mr. Simonite and the Rev. F. D. Horner, who saw the flowers when in the raiser's hands, have told me that they possessed the best qualities of the white ground varieties, but in some instances were of a paler yellow than Hogg's strain is represented to be, owing to his crossing with the best white ground forms to obtain quality of bloom. My own batch of seedlings of the Prince of Orange type I need not say anything about, because they have been exhibited so frequently, and have been grown in our own garden, and also in Mr. Turner's nursery at Slough. Mr. Dodwell is sending out no fewer than fifty-one varieties this season. I have not seen any of them, but as far as I can make out they are neither flaked Carnations nor edged Picotees. They will doubtless be grown somewhere else next year, and we shall be able to criticise them. I merely mention them because they are in existence, but it is surprising if such a large number are sufficiently distinct from each other.

Out of many hundreds of yellow ground varieties, I have raised several that are decidedly flaked Carnations; but a flaked Carnation on a yellow ground is a poor thing of decidedly sickly aspect when compared with the lovely bizzars and flakes on white grounds already in existence. I cannot say what yellow ground flaked Carnations may be capable of

in the future, but at present I am not much taken with them; and yet, if we may trust to the veracity of a coloured plate of one in the old *Horticultural Register*, vol. v., for the year 1835, the contrast of colours in crimson and gold is very beautiful. What we want is the rich yellow ground and decided crimson flakes. The variety is named Rodger's Unique Golden-crimson Bizarre. It was raised in Kent, from seeds obtained from Brussels, and was evidently of weak constitution, slow to increase, and was soon lost to cultivation. They expected good prices for choice flowers at that time, as this one was sold at a guinea per pair.

The yellow selfs are greatly valued as border plants, and amongst a numerous family of them I still think highly of King of Yellows, raised by Dr. Abercrombie, and sent out many years ago from Slough. The market growers tell me it is the best to grow for cut blooms, as the petals do not curl up in the rather impure London atmosphere, whereas Pride of Penhurst has this serious fault. I find a large number of yellow selfs amongst the seedling Picotees; but one yellow is very like another, and it is only when we obtain one with persistent flowers of the character of King of Yellows, or one of a richer, deeper yellow, like Ernest Benary, that it is worth while propagating them. Of course a raiser of seedlings must be careful not to save too many of them; and unless he has a perfect knowledge of the varieties already in existence, he is apt to think rather too much of his own productions.

Raisers of seedling plants of any kind are well aware that it is not difficult to raise varieties as good as the parents; the difficulty is to surpass the parents and be also distinct in colour. There is ample room for improvement in all the sections of the yellow Carnation and Picotee, and whatever diverse opinions may be held as to the decorative qualities of the Picotee in preference to the Carnation, or *vice versa*, there can only be one mind as to the necessity of maintaining constitutional vigour in the plants, so that they may grow freely out-of-doors. One of the members of the Carnation Society has told me that he has some yellow Picotees which have a perpetual flowering habit. If we can get them to produce flowers all the year round it will be an unquestionable boon. As far as regards the cultural requirements of yellow Carnations and Picotees, I do not find them more difficult to manage than others. There are weakly constitutioned varieties in every section, but as a rule they pass out of existence within the next decade after they have been raised, whether they are yellow or white ground varieties; indeed, I have found far more difficult subjects amongst the white ground than in the other section; in fact, Ascot Yellow was the only one that I could not keep life in, and it did not lack for coddling in pots. It was a true perpetual bloomer. The late Mr. Standish, of Ascot, brought it to one of the winter meetings of the Royal Horticultural Society, where it obtained a First-class Certificate for its perpetual blooming habit.

In regard to the general treatment and propagation of yellow Carnations and Picotees, I recommend that they be propagated by layering if they are intended to flower at the usual Carnation time, in July and August. They also ought to be layered at that date, and treated in the way recommended in previous numbers. Those of a perpetual flowering habit—or if they are not of that character, but are intended to be forced—I recommend raising the plants from cuttings in the spring months. They may be propagated, as the cuttings can be obtained from January to the end of April. They will strike freely in a mild hotbed, or in a forcing-house. If the atmosphere of the house is likely to be dry, the cuttings may flag a little, and in that case they ought to be covered by a bell-glass; because they will not be likely to make strong healthy specimens if the cuttings are not kept in a plump condition until roots are formed. The young plants should also be potted off as soon as they are fairly rooted, and be grown on while the weather is cold in a light airy position in the greenhouse, to be inured to the

open air while the weather is warm during summer. *J. Douglas.*

#### WINTER-FLOWERING CARNATIONS.

I think we may now safely get rid of the designation Tree Carnations as a kind of floral anachronism, and employ instead the happier and more fitting term, winter-flowering. The fact is that the long, lank, drawn habit of growth that characterised the Tree Carnations twenty-five years ago has quite disappeared, and the new varieties constantly being introduced are of a dwarf and free growth, and in many cases do not exceed 2 feet in height, and are even dwarfer. The tall habit of growth seen in past varieties was caused to a large extent by improper treatment: they were wintered in a warm greenhouse, and summered in glass-covered frames, and so induced to assume a lanky growth until it was assumed to be a natural characteristic. I can remember winter-flowering Carnations 4 feet in height, that produced three or four flowers only at the tips, and the stems were naked, and quite devoid of any think like grass.

The new varieties being sent out from Slough and elsewhere show quite a new type. We have now many fine varieties of dwarf, free bushy growth, that put up several flower-stems, and that carry a number of blooms undreamt of by those who knew the winter-flowering Carnation in its early stages of development. This is a decided gain; any one has only to visit the Royal Nursery, Slough during the winter to see how marvellously free of bloom many of the new varieties are; and Mr. Turner states he can cut bushels of flowers during the autumn, winter, and early spring seasons.

The system adopted of planting out the seedlings during summer is a good one; and as compared with the old plan of keeping them in pots, saves a good deal of time and labour. The seed is sown in February, or about that time; it germinates in a gentle bottom-heat, the plants, as soon as they are large enough to handle, are pricked off, and finally placed singly in pots, and then planted out in a well-prepared bed in the open ground. Here the plants grow freely and strongly, and throw up many flower-stems; in October the plants are lifted, potted, and when somewhat established, carried into a house where some artificial heat can be employed to assist them in getting into bloom.

It must not be supposed that anything like forcing takes place. Air is given freely, except where it might be hazardous to do so, and the artificial heat applied is simply for the purpose of keeping the atmosphere dry, and assist the flowers to expand. Hundreds of flowers are cut from the airy, roomy Carnation-house at Slough during the winter.

The best thing to do with the plants after they have gone out of bloom is to again plant them out in the open, so that they can make young growths from which to procure cuttings. By August there should be plenty of these, and the best thing to do is to pipe them as one would Pinks—strike them in a bottom-heat, and by November have them rooted and potted singly in pots to stand the winter. This is much better than leaving it until spring before cuttings are struck, as the plants are so much stronger, and bloom earlier, and much more freely in consequence. There is, I think, another advantage about planting out for the summer. A little seed may be obtained from the later blooms. The summer flowering Carnations will sometimes show a tendency to assume the winter flowering character. I have an instructive illustration of that tendency just now in the case of the fine yellow self-coloured Germania. A strong plant threw up five vigorous flower-stems, which bloomed in the summer, and towards the end of the summer threw up a third which has now developed three fine buds. The grass was duly layered, rooted, and potted off, and the old plant is now breaking out into growth at almost every point. The plant is now under glass, but whether I shall succeed in getting the flowers to expand in an unheated house remains to be seen. But this plant will give me a good supply of pipings

by spring, and I can either root them in heat, or place the plants out in the open to bloom through the summer.

Some seedlings from summer blooming Carnations show the winter blooming habit; they failed to flower during the summer, but they threw up flower-stems late, and I lifted the plants and potted them, and they are now coming on to flower in my cold house. But whether I shall succeed in flowering them with only such solar heat as may be vouchsafed during the winter, remains to be seen. *R. D.*

for twelve plants of *Primula sinensis* and some truly marvellous plants were staged by Mr. Hall, gardener to C. N. May, Esq., Elm Lodge, Devizes, in 8-inch pots, the foliage showing a diameter of from 2 to 2½ feet; and having many flower-stems crowned with fine blossoms. Some fine plants were brought from Birmingham by one of the leading *Primula* cultivators there, but they fell decidedly short of the home-grown specimens. There was nothing of a drawn character about the foliage; it was short, stout, and robust.

advances a little more heat is given, with weak liquid manure about twice a week. That such huge plants could be obtained in eleven months is really surprising, and it appeared to be a new revelation in regard to *Primula* culture; but the fact illustrates what can be done with the Chinese Primrose under high-class cultivation. *R. D.*

## CULTURAL MEMORANDA.

### TILLANDSIA LINDENIANA.

This is a pretty compact growing inmate of the stove, and produces, from the crown, which is surrounded by upright recurved leaves, erect flattened spikes of lovely blue flowers. The species is increased by potting up the suckers which spring from the base of the plants, in small pots, using peaty soil. These should then be given water, to settle the soil about the roots, and be placed in a moist warm house or pit to develop themselves.

### THE ALÓCASIA.

Of these plants there are now many handsome species and hybrids in cultivation. The leaves of many of these are large, with rich markings, and all of them possess more or less beauty and stateliness. They are increased by potting divisions of the crowns, suckers, and offsets in a mixture of peat and loam, growing them on in a warm stove, and keeping them moist at the roots.

### RONDELETIA SPECIOSA.

If cuttings of this somewhat slender-growing subject of the stove are put in now in small pots filled with peaty soil, and be treated as indicated above, stopping them once or twice when growth has commenced, after each shift into larger pots, they will attain to useful dimensions by next summer, when they will produce bright red trusses of Verbena-like flowers from the points of the young shoots.

### BULBS—HYACINTHS, &c.

Hyacinths, Narcissus, Tulips, and Jonquils, which are now showing flower, will now be assisted by giving them frequent waterings of tepid liquid manure until the last pip and flower has been opened, when applications of clear water will suffice. From the time the flower-spike appears, until the plants have done flowering, the soil in which they are growing should not be allowed to get dry. *H. W. Ward.*

## FRUIT REGISTER.

### PEARS IN 1888 AT BELVOIR.

The late season, although ungenial and unfavourable, has not been without its lessons to those who cultivate Pears, as well as to others who desire information to assist them in selecting suitable kinds likely to repay the trouble of growing under all circumstances of weather. Deriving many of our Pears from countries enjoying a higher summer temperature than our own, it is not surprising that a dull, cold season such as that of 1888 should affect unfavourably the quality of fruit. As to what extent this has been the case, and what kinds have proved most capable of elaborating the saccharine juices that help to give Pears the qualities we seek in them, it is important that information should be obtained, and that from different parts of the United Kingdom. As a rule, English-raised Pears and Apples do best in our climate, and this fact should stimulate those who have the opportunity to pursue the practice of crossing and raising seedling fruits—Pears especially. When we have a National Horticultural Society supported as Kew is, I hope fruit tree improvement will be one of the works taken in hand.

I add a few notes descriptive of the influences of the late season on the Pears grown at Belvoir. I may mention that we are in the North Midland district, 110 miles north of London; the altitude of the

FIG. 99.—PINUS LARICIO, CORSICAN PINE. (SEE P. 692.)

### PRIMULA SINENSIS FIMBRIATA AS AN EXHIBITION PLANT.

It is a frequent custom for compilers of schedules of prizes to make classes for plants of *Primula sinensis* at Chrysanthemum shows held during November, but those who are accustomed to visit Chrysanthemum shows have to admit that Chinese Primroses are one of the poorest of features generally. I think it is because little or no effort is put forth to grow the plants to anything like perfection. The invariable rule seems to be to cultivate *Primulas* simply as a part of the routine of winter decoration, and not to put forth any attempt to draw out the possibilities of development lying within the plants. But when it is attempted as at Birmingham and other places, it is surprising what results follow. At the recent Chrysanthemum show held at Devizes, handsome prizes were offered

Mr. May states that the seed from which these plants were grown was sown the first week in December, in a stove in which the day temperature was about 65°; when the plants were large enough to handle, they were potted singly in small pots, the compost used being made up of one-third leaf-mould and two-thirds loam, to which was added enough silver-sand to keep it nicely open, and a little charcoal to keep it sweet. The young plants are kept growing on in the same temperature, repotting them when necessary, till they are placed in the blooming pots, which should be well filled with roots by the end of May. Then the plants are placed in a cold frame until the end of July, as a kind of summer rest; then they are placed in a gentle heat, to excite them into growth and bloom. As the autumn

garden is 237 feet above sea-level; our rainfall averages 24 inches, and our soil is modified lias clay.

Jargonelle was fairly good in quality, and less affected than many others, and this applies to both wall and standard trees. Williams' Bon Chrétien (wall).—This fruit was small, very unequal in quality, many more softened, but shrivelled. Fertility (wall) was good, but the tree too small to produce a fair sample, but it is a promising fruit. Dunmore (standard) was juicy, and of good quality. Bergamotte d'Automne (east wall) failed to develop ordinary good qualities, and did not keep. Beurré d'Amanlis (wall) was inferior in quality, and did not properly ripen. Beurré superfin (south wall), though not so large as usual, was good in quality, melting, and the skin clear and bright yellow; undoubtedly one of our best Pears. Marie Louise (wall), although small, and irregular in ripening, still maintained its character as a high-class Pear. Some failed to soften, but even then were good. British Queen (west) is a seedling from the foregoing, and showing very much the character and qualities of its parent. Huyshe's Victoria (west)—an English Pear—was juicy, piquant, and fairly good. It is growing in favour with me. Maréchal de la Cour bore abundantly; was melting, juicy, but had less flavour than in good seasons. Beurré Suprême (east).—A rather small Pear, but one that never fails in quality or productiveness. In spite of the bad season, and an eastern exposure, it is one of the best November Pears this year. It seems little known. Pit-maston Duchess (west), although large and handsome, is of only second-rate quality in this latitude. It proved a melting Pear this season. La France (west).—A rather promising Pear, sent me by my old friend, Ferdinand Jamin, of Bourg la Reine. It proved juicy and agreeable. Beurré Diel is not usually a melting Pear, but this season it has proved so. Beurré Dubouison.—Small this year, but true to its character, a constant cropper. It is sweet and melting, but less high in flavour than usual. Beurré Hardy.—This useful Pear lacks its usual juicy sweetness this season, but it is still passable. The above represents the early and late autumn Pears. The result of the season on the winter Pears has yet to be noticed. *William Ingram, Belvoir, Nov. 27.*

## HOME CORRESPONDENCE.

Correspondents will greatly oblige by sending early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Photographs or drawings of gardens, or of remarkable plants, trees, &c., are also solicited.

**ANEMONES.**—In "November in the Garden," *Gardeners' Chronicle* for December 8, "L. A. L." has given us a very interesting account of the plants still blooming in his garden, but the frost of the early part of October was much less destructive with him than with us, for not only did it leave all the Dahlias a mass of rotteness, but every flower and bud on the Japanese Anemones was destroyed, showing them to be much less hardy than the varieties of *A. coronaria* which are still in full bloom with us. I would like to draw the attention of your readers to a great success we have this year achieved with the last-named flower as an autumn blooming plant. Early in August, 1887, I obtained a packet of new seed, which was sown at once in boxes; the seed grew readily and stood in the open air until late in the autumn, and during the winter had only the protection afforded by an unheated orchard-house. Early in the following spring they were planted out part on a sunny border, and the remainder between fruit trees, where they would obtain partial shade. As they had grown so well all the winter, being at the time of planting 3 or 4 inches high, I expected they would have gone on with renewed vigour when transferred to the open ground; but in this I was disappointed, as they made very little progress above the surface all the summer; but I am inclined to the idea that they were not dormant beneath the surface, for by the end of September they began to grow

with amazing vigour, sending up stout leaf-stalks, that bore no resemblance to those made before they were planted out, and which they still retained; these leaves were soon followed by flowers, so that they made a good show by the end of October, and all through November we have been gathering three or four dozen blooms a week. I need not say how very useful we have found them for the decoration of the rooms, being so very distinct from other flowers blooming at this season of the year. *G. B.* [It will make matters clearer to our correspondent when we tell him that "L. A. L." writes from Ireland, whose climate is milder than ours. *Ed.*]

### THE REDUCTION OF THE VARIETIES OF PEARS.

—My idea ament this question was brought so prominently before your readers a few weeks since that I thought it unnecessary to take any part in the discussion now going on until I read the notice at p. 675 of last Saturday's issue. A single paragraph in a note on that page, signed "N. H. P.," seems to me to settle the whole matter. It reads thus:—"It appears to me that the requirements of the family for whom the gardener has to provide as to quantity required, and the fertility of Pears in the neighbourhood must settle very largely the question of varieties a gardener grows." With this opinion I entirely coincide. The demand for the fruit here is not what I consider excessive; still, we are expected to have a supply good in quality and tidy to look at from August to March; and I say advisedly, and after many years' experience, that not twelve kinds, nor double that number, in some years, will ensure a constant supply of dessert fruit the season through. I note that Mr. Sheppard, at p. 641, does not say plainly that he has accomplished the feat with twelve varieties, and also fails to say in what manner "greater satisfaction" would be given to our employers if we grew but twelve kinds. I can only surmise that he means there are not more than twelve or fifteen varieties of first-rate quality. Certainly could name half a hundred to which that designation would apply. Of course, it does not follow that I would grow them all, or advise others to do so; I would rather say, Lose no opportunity of learning, both by your own experience and from the practice of others, as to what varieties do best in your neighbourhood, and having settled that point, then, if needs be, reduce the number of kinds. No fruits differ so much as Pears do in different soils, aspects, and climates, and it is a part (and, to me, a very interesting part) of the gardener's duty to make right selection of kinds from practical observation. I will quote a case in point from Mr. Sheppard's list of twelve varieties at p. 535.—Beurré Rance—named in that list. No matter in what form or position it is grown, it is here in no season fit for dessert, but is one of the best we have for stewing; on the other hand, Doyenné Boussoch, which is not good with Mr. Sheppard, is invariably good here. It is these erratic freaks that Pears alone, of all fruits, seem to have licence to take, which make it desirable—not imperative, to grow a goodly number of varieties, and only by doing so it is possible to avoid a break in the regular supply of good fruit. *W. Wildsmith.*

I am very glad that Mr. Markham (p. 675) has put a black mark against Beurré d'Rance—not Beurré Rance. Never in my life did I but once taste this Pear good, and that was when there had been a very hot, dry autumn, when it was really excellent, from a south wall. I do not say that it might not be better from an orchard-house, but certainly it cannot be recommended for planting generally, and I am very sorry to say the same of Easter Beurré. Once I saw and tasted some fruit of this Pear from the Royal Horticultural Society's Garden truly magnificent, and the flavour most excellent, but very few places can grow this kind well. Yet another Pear I must scratch, it is Easter or March Bergamot. I have never seen this fit for anything but stewing. I should like to plead for a good old Pear called Bezi Vact, discovered about 100 years ago at the Abbey of St. Waast. It requires an east or west wall to grow on, and it is then excellent at Christmas. I mention this kind because I do not remember once seeing it at the Chiswick Conference, and it would be a great pity to see it go out of cultivation. *J. Rust, Eridge Castle.*

—I think Mr. Rust entirely mistaken in stating the spurious variety of this Pear to be Althorpe Crassane, as one glance at the coloured plate of it in the *Herefordshire Pomona* is sufficient to convince any one that it is not that variety. I grow several trees of Althorpe Crassane here, and I find on comparing specimens of the fruit with the coloured plate of this variety in the *Pomona* that I have the true

one. There is a very wide difference between Althorpe Crassane and the spurious of Knight's Monarch, both in shape and the colour of the skin, as well as in flavour. *A. Ward.*

**THE ROYAL HORTICULTURAL SOCIETY.**—On Tuesday I paid a visit to the Drill Hall, St. James's, to see the last of this season's Royal Society's shows. The menu served was principally composed of Turnips and Sprouts from Chiswick, a nice lot of red-bellied evergreens, two or three pots of Primulas and Cyclamens, three Orchids, and a few miscellaneous things; a more miserable display could not very well be conceived, and I deeply regretted having been at the expense and trouble to wend my way to such an exhibition. What I cannot understand is the excessive modesty displayed by the executive. The public know nothing whatever of these shows. Short crisp paragraphs are never inserted in the London morning and evening papers (?). They are not advertised, nor do they ever appear in the free list devoted to announcing lectures, meetings, exhibitions, &c., which are scanned daily by the general public. Where lies the fault? Surely the executive should know that the only way to make our exhibitions a success, a good display is essential, and the power of the Press utilised in every possible way. My sincere advice is, Advertise, advertise, advertise! *A Fellow.* [The meeting in question was one of committees only. "A Fellow" clearly does not read the papers very closely. *Ed.*]

**STACHYS TUBERIFERA.**—It has had a place in the menu here for some years as Stachys, and I think this name more sensible than "Crosnes du Japon" of the French, or "Choro Gi" of the Japanese, from whom it was introduced by M. Paillieux. The cook here obligingly gives one good recipe for second course:—"Soak in cold water five minutes, rub well with Lemon, throw into boiling water with a pinch of salt for ten minutes. Strain and shake up with cream, or maître d'hôtel butter—must be served up at once." It is almost in daily demand here, and in various ways. The housekeeper says, from her experience, that it is an excellent ingredient in mixed pickles, but not so good as a pickle, by itself. Our yield this year is at the rate of about 5 tons per acre. I believe it capable of doing much more. *P. M., Wynnstay Gardens, Rhadon.*

**CARNATIONS.**—I find that several of my layered plants are falling in the centre, the leader dying off. The plants are quite healthy at the base, and vigorous in growth, but they fail in this important particular. I attribute it to the effects of frost—the sharp frost which destroyed so many tender things in October, affecting the plants when the growth was soft and young. In nearly every case it has attacked plants that I received somewhat late in the spring, and which did not start into growth until beyond the usual time. All that are affected in this way are potted off, and placed in a close frame to induce side-growths, and so secure another leader. On the whole, the young plants—except any such as are affected as I have just mentioned—look remarkably well, and appear as if they will be well forward when the time comes round for the spring potting. *R. D.* [This looks like the effect of Nematoid worms. *Ed.*]

**INTERNATIONAL EXHIBITIONS.**—There has been a lull this season in the excitement connected with international horticultural exhibitions, which, however, may soon pass away, as we frequently hear that it has been mooted by some enterprising horticulturists that an international exhibition may take place with a class of exhibits such as have not been represented in an international sense; but leaving that matter for the present, we are very desirous to learn when the first international horticultural exhibition was held in Britain or Ireland? Most of these grand shows have been for exhibiting the productions of fruit gardens, and only one which we visited fairly represented foreign horticulture. It was the first we had the pleasure of witnessing, and was held during October, 1862, in the Royal Horticultural Societies Garden at South Kensington. Well do I remember the display of Pears in the centre of the large conservatory, most of them foreign—which represented the strength of the fruit salesmen of Covent Garden; and to add more fully to the international character of the exhibition, immense displays of Grapes from the Continent were tabled. These fruits were carefully labelled, and this aspect afforded much instruction, and created a deal of interest. There was a good display of home-grown produce, and the Grapes of Mr. Drummond (Black Hamburgs and Muscats)

will never be forgotten by me. This was the only exhibition which we could really call "international" in character. We have visited ten since that time, all good, but would be specially obliged by information as to when the first was held, *Hortus*. [Does our correspondent forget the International of 1866? Ed.]

**DISA LACERA.**—I quite agree with Mr. N. E. Brown in placing all the varieties of blue *Disa* which have recently flowered under this species, and I can give confirmatory evidence to his theory that it is impossible to call one set *D. purpurascens* and the other *D. lacera*. The whole of the specimens noted as having flowered (I do not know about the Kew one), and also others, among which I may record one which flowered with Messrs. James Veitch & Sons last summer, and which I immediately pronounced to be *D. lacera*, were imported by me from a spot in South Africa, where they all grew together, and, according to my correspondent, there displayed that variability of colour which Mr. Brown suspects, as well as the differences in the fringing of the lip, of which we have evidence. So unreliable does this feature appear, and so common is the apparently uncut labellum that men with good botanical knowledge on the spot who have the means of seeing thousands in flower regard them all as *D. graminifolia*; indeed, a passage in a recent letter from a correspondent there, from whom I had asked information, deals with it as admitting of no doubt, simply saying, "Your *Disa lacera* is *D. graminifolia*." This conclusion is probably arrived at by the general appearance of the flowers, and not by comparative analysis. The last one which flowered with Mr. A. H. Smee, I must confess, deceived me, for the lip exhibited an apparently smooth edge. Examination, however, reveals the barest trace of a rudimentary fringe, and this feature will always be more or less developed in *D. lacera*. *James O'Brien*.

**LARGE AND SHOWY APPLES.**—The double and horizontal trained cordons generally occupy a position at no great distance from walks, and are used in a great many gardens for the purpose of forming an edging to them. When this is the object, it seems to me that the trees being immediately under the eye, and as the cordon, when in a healthy condition, generally produces fine fruit according to the variety, it is well to plant a selection of large, and those having an attractive appearance. Trees neatly trained, and which well cropped with fine specimen fruit, it is needless to say, are viewed by one and all with a wonderful amount of interest, and when planted close to the sides of walks as an edging they take up very little room, and the little trees are easily managed. For my own part, I do not care to see the horizontal-trained cordon too close to the ground, as is very often the case. Fourteen inches high is, in my opinion, none too much to look well, and about 8 to 10 inches away from the sides of the walks. It is by no means a difficult task to form good rows of trees, neither does it take a long period of time to bring them into bearing. All that is required is to stretch out horizontally a good stout single iron wire (not galvanised), fixing it firmly at each end at the height required, stout wood or iron posts being used at intervals as supports. It is, however, necessary to have one end fitted with the handy French invention—the *rabasseau*—the wire may be easily tightened. In commencing with maiden trees, and which are probably the best in the end, I would plant double cordons at 10 feet, and single at 6 to 8 feet apart. For the double cordon it will be necessary to cut the tree down to the height of the wire, and subsequently to train two shoots, resulting from this cutting-back, in opposite directions, endeavouring to obtain an evenly balanced tree. Such a cordon should, with attention as regards summer pruning, soon come into bearing. Trees after having been planted a few years, often make strong and unfruitful growth, and it is well to check this kind of growth without delay by digging around the trees in the autumn and pruning them, or replanting—the latter being really the best method. A list of large and good varieties of Apples suitable for all save the least favoured parts of Britain can be selected from the fruit catalogues of several of the important nurseries, so that an enumeration of them here is not wanted. *H. Markham, Mereworth Castle, Maidstone*.

**STACHYS TUBERIFERA.**—Referring to Mr. Thomas' excellent suggestion, we would state, that as there appears to be some slight obscurity with regard to the actual origin of this plant, we have decided to call it "the Chinese Artichoke," and think it a

favourable name by which it can be recognised in future. *James Carter & Co.*

**PRIMULA RUBRY.**—Permit me to state that I was the introducer and first exhibitor of this species. I obtained it from Passaic, New Jersey, U.S.A., early in spring. The plants soon came into flower, and were exhibited at one of the meetings of the Royal Horticultural Society, obtaining a First-class Certificate of Merit. I did not succeed with it afterwards. I think it proved too delicate for our climate, though probably I did not understand the treatment it required. I do not think it has been exhibited at one of the meetings of the Royal Horticultural Society's since probably with the exception of the Primula Conference. *R. Dean, Ealing, W.*

**FIRM SOIL FOR FRUIT TREES.**—We have noticed in many of the best fruit districts throughout England (especially Kent, Oxfordshire, and Worcestershire), that in positions where trees had unlimited space to grow (often on farm buildings and houses in streets) the fruit was of much excellence and little pruning was required. But on examination of the roots we found that in every case the soil was almost firm as a rock—had not been disturbed for many years, and in numerous cases there was a gravel path or cart-road over them. We always believe in allowing a root run in proportion to the dimensions of the branches; but at the same time have many proofs to which we could refer, that large trees can remain healthy for many years and bear excellent crops of fruit, also in limited spaces. The best Jargonelle Pears we ever saw were grown on a tradesman's house, with an aspect to the west and which had only a few feet outwards for the roots to subsist in—and the traffic to the dwelling-house was over them. The finest Apricots we have ever seen are grown in Oxfordshire, and many of the trees have subsisted in the pathways to dwelling-houses; and we know where some are doing remarkably well under the caseway of streets. In the West of England (in Bath district) Figs are to be found, year by year, bearing immense crops of the finest fruit ever seen, where the roots are encased in soil which has never been exposed to the light of day during the memory of the oldest inhabitants, and it is firm like concrete. In Essex and Suffolk (a county in which our friend, Mr. Sheppard, has done a deal of grand gardening), we have seen vineries which have been loaded year after year with bunches of white Grapes outside (chiefly on dwelling-houses), and scarcely a yard of ground in which the roots could extend outwards, and that had been trampled as a path for many years. We have always had strong faith in firm soil for fruit trees. *M. T. N. B.*

**CHRYSANTHEMUMS ON WALLS.**—I do not think that the many lovers of the Chrysanthemum have yet arrived at what may be termed the real value of these flowers when grown in suitable positions and in favoured localities as wall plants. Chrysanthemums are not climbers certainly, but, if by confining ourselves to a few good free-flowering and comparatively hardy kinds we can have the walls of our dwellings enlivened with their flowers I think that few would say nay, and particularly those who do not possess a greenhouse, and, in short, have not the means at disposal for building one. There are many, doubtless, who would embrace them in the manner here stated, if they had any faith in its efficacy. Of this there need be little doubt in all warm sheltered positions, especially on south walls. Quite recently I have seen some very passable blooms growing on plants which have been planted against the dwelling-house wall, and which have been nailed in position as the growth was made. The varieties which did best were Alfred Salter, Venus, Mrs. Dixon, Julia Lagravere—the two last doing equally well with an eastern aspect; while Madame Desgrange in a similar position flowered during the recent frosts with its wonted freedom, and hardly a petal was injured. I doubt not there are many other kinds which would make a really creditable display if grown as here indicated, selecting some of the semi-early kinds, as James Sater and Lady Salborne Midge. Lacer, Mrs. Randle, L'Or du Rhin, Blanche Colomb, and such things. In such positions the wood is almost sure to be well matured—a primary point in connection with their flowering. Annual planting does not appear essential, since plants may remain unremoved for two or more years. This fact enhances their value somewhat, since it enables the grower who may desire to increase the size of the plants and the space they will cover to train in more shoots from the base of the plants than would be possible were they moved yearly. I do not claim that there is

anything original in the above, as many cottagers adopt it in various parts of the country, and I believe it is not altogether unknown in Ireland, and my father also adopted it at least twenty years ago. Autumn flowering wall plants are by no means numerous, and if Chrysanthemums may be added, so much the better. *J.*

**ARALIA SIEBOLDII.**—A large clump of this handsome Japanese plant which appears to have been with us just about half a century, has been an object of considerable interest in a sunny forecourt garden of a villa residence at Ealing. Two plants were originally planted out, and they have so increased by means of throwing out stems that they form quite a thicket, and they have borne many panicles of their peculiar white flowers during the autumn, and helped by the sunny weather they have been as fine as under glass. The late Mr. Mongredien wrote of this plant twenty years ago—"A splendid addition to our fine-foliated plants, and, if it should prove hardy, no garden ought to be without it." That it may be regarded as hardy in the South and West of England, and in the more Southern and Midland Counties there can be no doubt; and probably farther North than is generally imagined. But what is the nature of the secret which exudes from the blossoms that proves so attractive to the blow-flies? *R. D.*

**YELLOW-BERRIED YEWS.**—In your issue of the 17th ult., p. 576, Mr. Watson, of the Clontarf Nursery, gives an account of the fine old yellow-berried Yews at Clontarf Castle, near Dublin, and admits being in doubt as to the existence of any others in Ireland, but should he pay a visit to Powerscourt, I should be happy to show him a fine old specimen. Our best tree is about 40 feet high, with wide-spreading branches, having a clear stem of 5 feet to the nearest boughs, and 20 inches in diameter, now in full berry. There is also another old tree, which was transplanted some eighteen or twenty years ago, and pruned down to about 20 feet from the ground, but it is making very slow growth. The age of the foregoing Yews is not certain, as there are no data as to time of planting, but Lord Powerscourt, who takes especial interest in all matters concerning trees and shrubs, tells me that he has seen one hundred years old if not 150 years. There are some nice bushes here raised from seed of the old trees I speak of, 8 feet and 12 feet through, with dense dark green foliage, and studded profusely with these yellow berries, which are much admired at the present time. I send a specimen of some for your inspection. *D. Cronbie*.

**CHISWICK TRIALS.**—Your correspondent from "Over the Sea," after animadverting recently on the fact of one of the committees of the Royal Horticultural Society largely composed of persons interested in commercial horticulture, inquires "What chance has an interesting plant exhibited by an amateur?" As I am an amateur, and have lately been "in touch" with one of the committees, through its secretary, Mr. A. F. Barron, it may be of interest to your readers to hear my experience. The subject of our correspondence was early dwarf Rhubarb, of which I claim to possess a kind differing from any other I have seen or heard of, and which for many years I have studied to cultivate in the best way. I do not force it, but treat it in such a manner as a long and patient experience has led me to adopt, and, as grown by me in the open ground, it seldom fails to supply me with a dish of Rhubarb before February is out, as I have said, without forcing. Having published these facts elsewhere, and having, of course, my statements challenged, I accepted the challenge made in the *Journal of Horticulture* (July 5, 1888, p. 10) to send a root of my Rhubarb to Chiswick for trial. What person who had succeeded in growing a vegetable in the open, a very long month in advance of any grower known, would submit his vegetable for adjudication without supplying cultural directions? With regard to Rhubarb as grown in England for early consumption I have come to the conclusion that the usual mode is unscientific. The plant naturally contains oxalic acid, which from its unwholesomeness leads the best physicians to strike this vegetable off the dietary of many patients. Believing that this oxalic acid is largely developed by any known mode of forcing I have given up forcing altogether, and have printed my mode of treatment. I inquired, therefore, of the Chiswick authorities if, in the event of my sending (as I was willing to do), a root of my early Rhubarb for adjudication, the committee would cause to be followed my printed cultural direc-

tions—forwarding them two copies. I suppose it was considered presumption in an amateur venturing to instruct horticulturists how to grow Rhubarb. Certain it is that the committee would have none of my advice. I was informed that the root I might send would be planted with the others, and treated in the same manner." A gracious approval was vouchsafed in a lofty and royal way to my directions, which "are very good, and much to the point," but the committee would have none of them—they would be ignored; the Rhubarb root "would receive the same attention as others." Now, an eminent society in the gardening line might with due self-respect have sent me some such answer as the following:—"Being many of us commercial horticulturists, we consider in our official capacity that you as an amateur are *a priori* disqualified from testifying to any fact whatever in the vegetable kingdom; but as we are not tied hand and foot with red tape, we do not disdain to take a light even from a flint; and as you say you have for many years studied the growing of Rhubarb, and have certainly made out a *prima facie* case, we will grow your Rhubarb, and honourably follow your cultural directions." Perhaps some such answer to me may still be forthcoming, for "Head Gardener" is pretty confident that "a few years will see the management of the Royal Horticultural Society conducted in such a way as to meet with our hearty approval." *W. H. Sewell, M.A., Xasley Vicarage, Suffolk, Nov. 28.*

**WALNUTS OF 1888.**—Referring to J. J. Willis' remarks on the non-value of the Walnut crop, at p. 577, I may say that it is exactly the same cry hereabouts—plenty of nuts, but nothing in them. The same stands good with the Filberts and Cob-nuts, no doubt owing to the want of sun-heat to mature the kernel [or, more probably, from imperfect fertilisation]. *D. C., Powerscourt, Ireland.*

**EARLY MARKET PEAS.**—Market growers of Peas seem this season to be endowed with considerable meteorological faith, as a mild, or at least an open, winter is looked for. That the weather so far has been exceptionally soft and genial for the time of year there can be no doubt, and a green Yuletide is far from improbable; but the worst winter weather invariably comes after the New Year is in, and there is yet plenty of time for severe frost. However, it seems that faith in a mild winter has been helped by the recent generally excellent condition of the soil, which on gravel has worked admirably. Stimulated by such admirable encouragement, large breadths of Peas have been sown so early that rows are now showing in all directions, whilst other sowings are proceeding. By means of broad drills, which sow three rows at once, several acres of ground are soon got over. Drilling sows Peas, perhaps, rather more thinly than when done by hand, and not quite so deep, so that the rows come through quickly and with great success. The customary width for Sangster's, Eclipse, William I., Sunrise, and similar kinds, is about 27 inches, as that distance enables the horse-hoe, one of the most useful of field-cultivating implements ever made, to be freely employed. It by no means follows that a good Pea plant in December means a good crop in the following summer. Even if the breadths escape the hard frosts of the early part of the year, they often suffer severely from the effects of bitter keen east winds in March and April; whilst, if they escape these, and flower early, they may but find May frosts, severely injuring the treacherous bloom. Again, it has often been found that breadths sown in the month of February in light soil have been quite as early in cropping as those breadths sown in November, thus illustrating the old adage, "More haste, less speed." *A. D.*

**REMARKABLE DISCOVERY IN AGRICULTURE.**—This is the heading of an article in a circular now before me; it refers to the discoveries of M. George Ville, of Paris, who affirms that he has made himself acquainted with the process by which Nature converts the seed into the plant, the plant into the flower, the flower into the fruit. His theories, it is said, in the exact measurement in the degree of ozone and ammonia supplied by Nature to each plant. We as gardeners have much to learn as regards chemical manures and their application, which few will deny. Vegetables, fruits, and plants have been, and are still grown, which for quality and excellence one would imagine it impossible to surpass; and this simply by growing or planting in suitable soils and by the use of ordinary farmyard and other common manures; but it seems as if cultivators in perspective will use none of these old-fashioned abominations, but will rely principally upon chemical manures for supplying the

crop with that which is necessary for the building-up of its various parts. M. Ville has even gone farther than this, for it is said that he has grown plants which are generally cultivated in the best manured and most laboured soils in the caldine refuse of the porcelain ovens, and which has been, besides, washed in distilled water and recalcined, which, says M. Ville "is simply to display the power of my chemical manure," and the results are said to prove that the most dry and barren soils may be productive of crops as rich as those planted in the most fertile ground. "Nature," says he, "gives to the plant nine-tenths of what is necessary to its nourishment, that is to say, air and water; the tenth part is administered by me in the shape of lime, phosphate, nitrogen, and potash." The field of experiment is laid out in square patches, each planted with a different species of vegetable produce. For instance, the Beetroot without manure is poor and unhealthy; in the next square it has undergone half manuring, and begins to look stronger and more promising; in the third square it has been submitted to complete treatment, and the produce is superb. The same result is obtained with the Vine, Wheat, and Maize, and all kinds of vegetable and fruit trees as well. M. Ville observes that but one ingredient is necessary for the production of every plant in Nature, and that is lime (!); but every other kind is peculiar to the species of plant under cultivation. A Vine covered with fruit was exhibited early in June, and by its side another on which the buds were just beginning to be seen. Grapes from the fruitful Vine were sent to the Prince of Wales, who, on his visit to Paris, had expressed himself highly interested in M. Ville's experiment. Another instance of the success of the system is quoted. At Arboussier, in the island of Guadeloupe, the crop of Sugar has hitherto been estimated at 40,000,000 of canes. It has increased to 100,000,000 ever since the adoption of M. Ville's system. May I ask if any of M. Ville's experiments have been repeated in England by any of the numerous readers of the *Gardeners' Chronicle*? If so it would be interesting and beneficial to learn what results. *W. Harrow.*

## SOCIETIES.

### ROYAL HORTICULTURAL.

**TUESDAY, December 11.**—The last meeting of the winter year was held in the Drill Hall, James Street, Westminster, on the above date, and may be said to have been remarkable for the fewness of the exhibits.

The plant of greatest interest was Skimmia Foremanni, a robust growing hardy plant, raised by Mr. Foreman, Eskbank, Midlothian. The other points of interest were the vegetables from the Society's Garden, consisting of Brussel Sprouts and yellow and white Turnips.

#### Scientific Committee.

Present: G. F. Wilson, F.R.S., in the chair; Hon. and Rev. J. T. Boswell, Professor Church, Dr. Scott, Mr. Morris, Mr. O'Brien, and Rev. G. Henslow (Hon. Sec.).

**Oak Wood, Defective.**—Specimens of Oak wood, forwarded by Mr. Burbridge, which had been used for spokes of wheels, but found to be remarkably brittle, and consequently useless, were submitted to Professor H. Marshall Ward for examination and report. The following communication was received from him:—"I have cut numerous sections of the pieces of Oak, and have made a very thorough examination of the wood, but must say I can find no traces of fungi or pronounced decomposition. Nevertheless, the tracheids of the wood seem to be abnormally short, and have occasionally granular 'deposits' in them—also in the medullary ray cells—which I should like to know more about. I cannot explain the matter, but should be glad of further specimens for examination."

**Ivy, Staminate of the Pistil.**—Mr. Henslow submitted some specimens of abnormal Ivy blossoms to a microscopical examination, which were exhibited at the last meeting by Dr. Masters, together with drawings by Mr. G. W. Smith. The dried condition of the flowers precluded a very exact determination

of the abnormality; but there appeared to him to be little doubt but that stamens replaced the carpels. The sepals, petals, and stamens were normal, but above the superior disc—which is normally formed by the upper and exposed part of the carpels—was a crown of supernumerary anthers. The vascular cords which normally represent the dorsal ribs of the carpels bore the anthers. In the centre was a depression in lieu of the ovarian cells, and apparently some minute and rudimentary anthers occupying their place. These seemed to be due to staminody of the placental cords, which normally occupy the centre of the inferior ovary.

**Stachys tuberosa: Analysis of the Tubers.**—Professor Church gave an account of an analysis of the tubers of this new vegetable which he had himself made, and by which he confirmed those of Dr. A. v. Planta, recorded in *Landwirthschaftliche Versuchsstationen*, Nos. 5 and 6, 1888. It appears that they contain 75 per cent. of water, 15 per cent. of 70 minerals, 1.7 per cent. of non-albuminoids or amides, 16.6 per cent. of sugars, 7 per cent. of fibre, 1 per cent. of ash, .2 per cent. of fat, and a trace only of starch. Comparing this analysis with that of Potatoes, it appears that the water is in larger quantity, it being 75 per cent. in them; the flesh-forming albuminoids are rather more than in Potatoes, while the sugars replace the starch, of which there is some 15 per cent. in the average analysis of the Potato.

**Satyrion sp. with "Supertuberation."**—Mr. O'Brien exhibited palmate tubers of some South African species, which showed two years' growth, having been plunged in moss only; the tubers, instead of developing a leafy axis, had formed fresh tubers only, the stem and leaves being produced in miniature, being about half an inch in height. Mr. Wilson mentioned the fact that Lilies sometimes behave in the same way, and that the process was identical with "supertuberation" in Potatoes, in which case the "eyes" gave rise to fresh tubers instead of stems, when situated too deep and with too much heat, according to the experience of Mr. Boswell. Mr. O'Brien remarked that the importance of the knowledge of the above phenomena lay in the fact that it was often supposed that tubers and bulbs were lost or decayed, from the non-appearance of the flowering stems, while they might still be present in the soil, but were for two or three years simply reproducing bulbs at the expense of the old one, without flowering at all.

**Lime with Contorted Boughs.**—Mr. G. Swales forwarded a young lime tree grown from a layer, the only one of 500 which exhibited the peculiar growth. A graft taken from it in the spring exhibits the same peculiarity. Dr. Hogg remarked, that it appeared to resemble the "contorted" variety of the Hawthorn. The curving and twisting was apparent even in many of the minutest twigs. It was thought by some to be due to mischief or injury by insects; but the above facts seem to point to other causes. It was referred to Chiswick, to be grown, to prove the constancy of the feature or otherwise.

**Christia.**—This is a new production for antiseptic bandages, invented and patented by Mr. T. Christy, of 25, Lime Street. It is constructed of thin whitey brown paper, expressly made. Manila Hemp (*Musa textilis*), which consists purely of remarkably long fiber-fibres, which doubtless tend to give it greater tenacity. It is then subjected to a process with glycerine, olive oil, and other substances, which render it translucent, with the appearance of oiled silk. It subsequently is treated with salicylic acid, carbolic acid, or other disinfectant, and rendered antiseptic. Its advantages are—great tenacity, extreme lightness, being not more than one-third of the weight of oiled silk or gutta-percha sheeting, antiseptic, and perfectly impervious to moisture. It was thought that it would prove exceedingly useful in horticulture, e.g., for binding up in budding, sending specimens by post when the exclusion of air is essential, while strips would be serviceable for tying plants to stakes, &c.

**Korsambi Nuts.**—Mr. Henslow showed specimens, received from Mr. Christy, of the seeds of *Schleichera trijuga*, of the order Sapindaceae. It was supposed to be the source of Macassar oil, but this was strongly doubted. Mr. Morris observed that it is called the "India Oak tree" and is abundant in India and Ceylon, and is valuable for its timber.

**Juniperus occidentalis.**—A specimen, collected in eastern Oregon, U.S.A., by Mr. William Stewart, was forwarded by him from Greenock, N.B. It was first found by Douglas in the Storr Islands in the Columbia River. It was also found in the

Klamet Mountains, in the Oregon territory, at 5000 feet. It grows from 40—80 feet high, and, like other species, varies in foliage in passing from the young to the older stages. The specimen sent was spring-leaved, or in the characteristic condition of the young stage. It is remarkable for the strong and disagreeable odour when bruised (*Gordon's Pinetum*, p. 163).

*Centenary of the Dahlia.*—Mr. Henslow called attention to the fact that the year 1889, besides being the centenary of the Chrysanthemum in Europe, was also that of the Dahlia in England. It was introduced by the Marchioness of Bute in 1789, and figured with single and double forms in *Bot. Mag.*, vol. xlv., t. 1885, and *Bot. Reg.*, vol. i., t. 55.

### Floral Committee.

Present: G. F. Wilson, Esq., in the chair; and Messrs. W. Bates, H. Herbst, W. Holmes, B. Wynne, R. Dean, J. Dornay, H. M. Pollett, J. O'Brien, H. Ballantine, W. Wilkes, and H. Hill.

The exhibit of *Skimmia Foremanii* × by Mr. Foreman, of Eskbank Nurseries, Midlothian, was a welcome addition, and it is evidently a valuable shrub for the open ground, window-boxes, &c. It is said to have been raised by crossing *S. oblata* with *S. fragrans*. The habit is dwarf and dense, constitution vigorous, and foliage dark green, and it has the propensity to berry in an extraordinary degree. Another seedling from the same cross was shown, with leaves as large as those of a common Laurel. The fruit of *S. Foremanii* endure for two years, and the plant is of extreme hardiness, having withstood 32° of frost without any protection. Some of the plants shown measured 2 feet in height and as much in diameter, but it will, we were informed by Mr. Foreman, reach much greater dimensions.

Messrs. Heath & Son, Cheltenham, showed two *Masderallii*, one being the result of crossing *M. Lindeni* and *M. Veitchii*, the flower scarlet, with two lines of a darker hue on the side segments and one in the centre of the apical hood; the other, the result of crossing *M. ignea rubescens* and *M. Veitchii*, had flowers of a rather lighter hue.

A small panful of *Pleione maculata* was furnished by Mr. Rowe, The Gardens, Nunfield, Dumfries. The flowers, not numerous produced, were white, with a primrose-yellow stain on the upper surface of the lip.

Some few *Cyclamen* blooms of the giganteum type, as well as a well-grown plant of the same, named *Rosetta*, a fine large rosy-purple flower with a darker eye, were shown by Mr. Odell, florist, Gold's Green, Hillingdon.

A Tree *Carnation*, pure white, and with frimbriated edges to the petals, was shown by Messrs. Collins, Brothers, & Gabriel, 39, Waterloo Road. It is named *White Andalusian*, and is a pretty addition to the section.

An excellent pink-flowered *Primula sinensis*, *Swanley Pink*, came from the Home of Flowers, Swanley. It is a regularly-shaped flower, with overlapping segments, of great substance—the colour a soft shade of pink. Many blooms of Mr. Cannell's strains of *Primula sinensis* were likewise shown by him. *Primula sinensis* Great Western, a fine crimson flower of good quality, came from Messrs. James & Son, Farnham Royal, Slough. The mild character of the winter, hitherto, was well shown in Mr. R. Dean's boxful of hardy *Primroses* gathered from the open ground. He also exhibited a number of flowering plants in pots of *Primula obconica*.

### FIRST-CLASS CERTIFICATES.

*Skimmia Foremanii* × from Mr. Foreman.  
*Primula Swanley Pink*, from H. Cannell & Sons.

### Fruit Committee.

Present: Dr. R. Hogg, in the chair; and Messrs. H. Veitch, W. Warren, W. Denning, J. Burnett, P. Crowley, G. T. Miles, Harrison Weir, J. Wright, R. D. Blackmore, S. Ford, C. Howe, C. Ross, W. Marshall, and F. Barr.

Mr. Campbell, Priory Road, Roehampton, received a Cultural Certificate for some very good examples of blanched Batavian Endive.

The Society's Gardens contributed a large assortment of various strains of Brussels Sprouts which have been grown there on trial. The quality was varied, and ranged from very bad to very good. We specify a few strains which may be classed in the former category, viz., Wroxton, Dalkeith, Burghley, very tall, but with hard small Sprouts; Wrench's King, French Superior Dwarf, sent by Mr. P. Barr;

Rosebery, very good. A collection of Turnips was likewise sent from Chiswick, but in these the quality was not so varied as was the case with the Brussels Sprouts. English strains with one exception—Yellow Finland—were superior to any Continental ones shown. The best as regards appearance were Early Milan, Red Globe (Veitch), Model (Watkins), Snowball (*ibid*), Silver Ball; (Rutley & Silverlock), Snowball (Nutting). The Yellow Finland (Vilmorin), was very nice, being quite small (2 inches in diameter), and with a beautifully smooth skin; the English strain of the same (Rutley & Silverlock) was not quite so full in appearance, nor so delicate-looking. Some strains of Golden Ball Turnips were excellent.

Seedling Apples were shown by Mr. W. Blackmore and Messrs. W. J. Brown, but there was nothing which calls for comment.

Mr. J. Willard, Holly Lodge, Highgate, sent *Asparagus Chicory* in the green state; and Mr. R. Gilbert, Burghley, Stamford, showed his Chou de Burghley and Universal Savoy, each excellent of their kind.

Unpowdered calcined sea-shells, rich in phosphate of lime, alkali, and other mineral ingredients, were shown by Mr. A. Dean, Bedford. We thought the price—7s. 6d. per cwt.—for what is little more than lime, almost prohibitive except for pot plants, still the stuff should be more valuable as a manure than shells simply crushed.

*Cold Storage.*—The report of the sub-committee appointed to conduct experiments in the cold storage of fruit was presented, and was not, on the whole, of a favourable character, the keeping properties of some kinds of fruit being materially prolonged, while others, notably Melons and Tomatoes, entirely failed. The chamber was not considered suitable, the atmosphere not being sufficiently dry for the purpose, nor so sweet as was desirable. With a dry atmosphere and equable low temperature there is no doubt that the keeping of hardy fruit can be materially prolonged. The report is forwarded by the Council of the Society for consideration.

### FIRST-CLASS CERTIFICATE.

*Asparagus Chicory*, from Mr. J. Willard.

### LINNEAN.

DECEMBER 6.—Mr. W. Carruthers, F.R.S., President, in the chair. The following were elected Fellows:—H. E. D'Alton, of Victoria; P. Goyen, of Otago, New Zealand; G. A. Grierson, Lecturer on Botany, Sheffield School of Pharmacy; Maurice Holte, Superintendent, Botanic Garden, Port Darwin; R. W. Hullatt, Singapore; J. C. Lisbon, M.D., Fellow, Bombay University; J. H. Lacey, Forest Department of India; Professor J. B. L. Mackay, Director, School of Mines, Sandhurst, Australia; E. W. Mayhew, Fremantle, West Australia; Digby S. W. Nicholls, Cowbridge, Glamorganshire; D. T. Playfair, M.D.; D. Drain, B.A.; Clement Reid, F.G.S.; A. B. Rendle, B.A., B.Sc., and Peter Yates, M.D.

Mr. W. H. Beeby exhibited and made some remarks on specimens of *Valeriana Mikani* and *sambucifolia*, and a series of *Potamogeton* fluitans. Mr. F. W. Oliver described the nature and growth of leaf emergences in *Eriosepium folioliferum*. Mr. E. M. Holmes exhibited specimens of a new *Asafoetida* plant, *Perula fetidissima*, and a monstrosity of *Zea Mays*. Mr. J. G. Baker, exhibited a curious variety of *Vicia sepium* found in North Yorkshire. Mr. T. Christy exhibited specimens of an undetermined species of *Echium* received from Persia, and employed medicinally as a good alterative.

The first paper read was one by Dr. Costerus, on "Malformation in *Fuchsia globosa*," upon which Professor Bower offered some critical remarks.

The next paper was by Mr. B. T. Lowne, who gave an admirable demonstration of the mode of development of the egg of the blow-fly. His conclusions were criticised by Professor Stewart, Professor Howes, and Mr. A. R. Hammond. In continuation of the reports on the collections made by Mr. Bidley in Fernando Noronha, a paper was read on behalf of Mr. Boulenger, enumerating the fishes and reptiles which had been identified by him.

An evening meeting will be held on December 20, at 8 p.m., when the following papers will be read:—1. "The Natural History of the Kangaroo Island Grass Tree." By J. O. G. Tepper, F.L.S. 2. "Apocytis a Volvocineae." By Spencer Moore, F.L.S.; 3. "On some New Species of Shells." By G. B. Sowerby, F.L.S.

## COLONIAL AND FOREIGN.

### A FEW ALPINE CRUCIFERS.

THE family of Crucifers does not contain many ornamental species, and with the exception of Stocks and Wallflowers, horticulture is only indebted to it for good and useful vegetables. But amongst alpine and rock plants we have now more than one species of this order valuable either on account of its flowers or its foliage. *Dentaria*, *Alyssum*, *Ethionema*, *Draba*, *Arabis*, &c., are all of them beautiful, free-blooming, and interesting.

### ALYSSUM.

As an instance we will take *Alyssum*. This genus (I mean the true *Alyssums*, and not *A. spinosum*, L.; *A. maritimum*, Lamark, which are now included in the genus *lobularia*) contains only species with yellow flowers, this yellow varying from a deep to a clear shade. The plants are usually vigorous, robust in habit, with foliage more or less silver or whitish, the flower-stems strong and well covered with blooms. The one longest known in gardens is the charming *Alyssum saxatile*, which grows on dry slopes in South Austria, by the Mediterranean, and on the isles of Cyprus and Candia. The plants are covered with golden-yellow flowers; during the months of May, June, and July they form one of the best edgings known. It is a bright variety, and widely distributed in gardens. There is also a variety with variegated foliage. *A. gemmonense* (A. medium Host, A. petraeum, And.), of Transylvania, is a species nearly allied to the preceding; the foliage, however, is narrower and more crowded, and the racemes of flowers elongated instead of being disposed in umbels. It is found only on calcareous soil. *A. orientale* is found in Crete, Greece, and Turkey; the foliage is downy, the flower of a golden-yellow colour. This plant requires a dry, sunny situation. *A. leucadum* grows in Italy, forms tufts with many offsets, produces but few flowers, and rarely seeds. *A. montanum* is a plant common in the Alps, in Northern Italy, on the Pyrenees, and in Germany. Its yellow flowers form dense, elegant, much-divided panicles, and it is one of the best ornaments on the rockery from May to August: it likes to grow in crevices of the rocks, in a sunny situation, and also does well on old walls. *A. atlanticum*; found in diffusions, from the Abruzzi (A. sibiricum, Willd.), are Crete and North Africa; *A. altaicum*, from Siberia; *A. species*, much resembling *A. montanum*. *A. alpestre* is a very rare plant in the Valais; the flowers are small, clear, yellow, and the foliage is greyish-green; it prefers a dry, sunny situation. *A. lapeyroussianum* and *A. pyrenaicum*, from the Pyrenees, are very similar to the above, as also is *A. tortuosum* (found in Hungary), which seems to be only variety of it. *A. alpestre* (A. argenteum, Gaudin) must not be confused with *A. argenteum*, Witm. The plant of Gaudin is very rare being scarcely ever seen out of Piedmont. *A. argenteum*, Witm., from Germany, Verviers, and Southern Europe; there is also a Hungarian variety. *A. murale*, and *A. argenteum*, Witm., are both pretty plants, with silvery foliage, with masses of small flowers in elegant panicles, which cover the rocks during the great part of summer. *A. cuneifolium* is found on the Apennines and Pyrenees; it is dwarf and compact in habit. Flowers small, arranged in small, compact, clusters. They are golden-yellow in colour. *A. wulfenium* (from Carinthia and Carniola), is according to A. Kerner, the same species as *Rochelii*. I have both in my alpine garden, and am quite of the same opinion as is the Austrian botanist. This plant is intermediate between *A. montanum* and *A. alpestre*; the flowers are relatively large, and of a brilliant yellow colour. The plant grows on gravel soil by the borders of streams among the Alps of Carinthia and Carniola. *Alyssum ovirens* is found on the limestone rocks amongst the Ötztal Mountains in the Venetian Alps. This plant is a very interesting one, and is always found to-

gether with *Linaria alpina*, *Thlaspi rotundifolium* and *Saxifraga biflora*, at altitudes of from 6500 to 7150 feet. The flowers are large and of a vivid and brilliant orange-yellow. The foliage is thick and handsome. The plant has only recently been cultivated. *A. Wierzbickii*, from Southern and Eastern Europe, is an excellent plant for decorating rockeries and borders. The flowers are of a vivid and bright yellow colour, erect and arranged in clusters; they open in succession, from April and May until July and August. This species is little known now, but it will probably become very useful as a decorative plant for gardens. I have received, under the name of *Alyssum Mollendorffianum*, from Austria, a little gem which has not yet flowered in the alpine garden, because the seedlings are only those of last winter, but which, as regards the foliage, is certainly the best species of the genus. The leaves are comparatively large, rounded, and shining, of an ash-grey colour, with bright silverish-white spots. The stems are trailing, thick, short, and spreading over the soil. This is an excellent plant for rockeries, not only for its flowers (with which I am not yet acquainted), but it will be sought for on account of its ornamental foliage. I have also received from the same source a very free-blooming variety of *A. Wulfenianum*, by which the Austrian botanists make a species under the name of *A. Heinzi*, and which is much to be recommended on account of its golden flowers and silver foliage.

All the *Alyssums* require sun, and do best when growing between rocks or on gravel soil. Some of them are excellent perennials.

#### DRABA.

The genus *Draba* is quite different—first, because there are some species with white and some with yellow flowers; also the form of the plants is in clusters or small rosettes, not very spreading. Like *Alyssums*, *Drabas* are rock plants, but the latter grow as well in the North as in the South, while *Alyssums* are species native of the sunny slopes of the mountains of Southern Europe. *Drabas*, on the contrary, are nearly all included in the Northern flora, and in that of the high altitudes. *Draba aizoides* is a native of the Alps and Pyrenees, and with its varieties *affinis* and *elongata*, is beyond doubt to be highly recommended for its hardness, its facility of adapting itself to our climate, and for its early blooming qualities. With *Saxifraga Burseriana*, and *Androsace Lageri*, it is among the first spring blossoms, and its bright yellow corolla enlivens the rockeries on the first fine days of February and March. *Draba brachycarpa*, from the Alps of Eastern and Southern Europe, is synonymous with *D. aizoon*. It is a finer and larger species than *D. aizoides*, is more decorative, but also more liable to damp off. When under cultivation it is generally attacked by a little winged insect which attacks and rapidly destroys Crucifers. In these two species the foliage grows in rosettes, the leaves are bordered with hairs more or less long; and the flowers are yellow, growing in little clusters on the tops of the stems. The plant prefers to grow on limestone rocks. *D. brunifolia*, from the Caucasus, is a similar species, but one of which the foliage is shorter, spreading over the soil. The leaves are almost destitute of hairs, and the plant forms a sort of low turf, that is to say, the tufts of leaves are quite inconspicuous. The flowers are of a bright yellow-ochre colour and not numerous, but there is a succession of them on the plant during all the summer. *D. alpina*, from Lapland and Scandinavia, synonym, *D. pauciflora*—a species with downy, hairy leaves. The flowers are pale yellow. *D. cuspidata*, from Toria and Italy, has small yellow blossoms, synonymous with *D. taurica*; *D. Gmelini*, habitat Ural and Siberia; *D. alpina*, from Mount Olympus and Corsica; and *D. rupestris*, of Scotland and Norway, are all species with yellow flowers, more or less similar to each other, and very easily cultivated. A certain number of white-flowered species are interesting, but less ornamental. The principal are *D. tomentosa*, of the higher regions of the Alps and

Pyrenees, with silvery-white foliage, and which requires to grow on rocks and stones; *D. fladnizensis*, from Carniola; *D. incana*, from the Alps; *D. muricella*, of Arctic America; *D. contorta*, from the Pyrenees, &c. *Petrocallis pyrenaica* (*Draba pyrenaica*, L.), from the Alps and Pyrenees, is an excellent species, growing in compact clumps, bearing lilac flowers, growing in cushion-like tufts. It is met with at an altitude of from 6500 to 7150 feet, and almost always on calcareous soil. The cultivation of this species is not easy. It likes a vertical position, that it may not rot, and a semi-shaded situation. It succeeds well on old walls. *Henry Correvon, Directeur du Jardin Alpin, Geneva.*

(To be continued.)

## THE HERBACEOUS BORDER.

### LIATRIS.

Few hardy border plants are prettier than the *Liatris*, or Button Snake-root. They belong to Compositae, have flower-heads of various shades of purple, and some are white. The species are natives of North America. The former are perfectly hardy in this country, and sufficiently so, in fact, to succeed in bog-gardens if a slight protection during our winter months be given in the case of the latter. The species already introduced, and now in possession of nurserymen, whilst limited in number, are nevertheless an excellent selection, and consist of the following:—

*L. pycnostachya*, or dense spiked, a tuberous-rooted form, pale purple in colour, growing to an average height of 3 feet, the spikes of bloom being some 14 inches higher, very broad, and enlarging from base to apex with much effect, so as to have received in its native home the name of Kansas Gay Feather. It is best treated as a biennial, sowing the seeds in the spring. *L. elegans* is a robust grower, and in some soils reaches a height of 4 feet. It has spotted glabrous leaves and purplish blossoms. *L. spicata* is not so tall as the above, and rarely exceeds 2 feet in height. The flower-heads measure from 6 inches to 1½ foot in length, and are covered with sessile purple flowers. *L. punctata* is a recent desirable introduction, exhibiting some variety in the colour of its flowers, as the name indicates. *L. odoratissima* (*Trillisa odoratissima*), which seems never to have received recognition at the hands of English botanists, is a species desirable enough to be imported from America, where it is known as the Vanilla plant, owing to its Vanilla-like scent. Although an inhabitant of the Southern States, and consequently tender, it would be an interesting introduction. *William Earley, Ilford.*

## THE FERNERY.

### DODDIAS.

The *Doodias* are not quite so showy as many Ferns, yet they are very desirable on account of their having a symmetrical habit of growth, forming neat compact little plants; and some of the varieties are rendered additionally attractive when growing by the young fronds being brightly tinted with red. *D. aspera* and its variety, *D. a. multifida*, are both very pretty, especially the latter, which grows only a few inches high, the fronds being prettily recurved, and terminating in a branching crest; the type grows a little larger, and is not quite so dense in habit; in both the young fronds are brightly tinted with red. *D. media* is sometimes confused with *D. aspera*, but may be distinguished by being of more erect growth; the fronds also have a more even surface, and are rather larger. *D. Kunthiana* has larger and more spreading fronds, otherwise it closely resembles *D. media*, of which, I believe, it is a variety. *D. blechnoides* is another very pretty species, with rather long narrow fronds. *D. caudata* is a distinct little Fern, and very pretty when

properly cared for, but as its appearance as a weed in all sorts of odd corners, it does not often get the attention which is accorded to those more difficult to obtain.

The *Doodias* are generally regarded as greenhouse Ferns, but, with the exception of *D. blechnoides* and *D. caudata*, all the above succeed better in rather a higher temperature. They should have a light open position, but do not like a dry atmosphere; they require more water than most Ferns, and if allowed to become a little too dry the fronds shrivel up very quickly. To have the *Doodias* in good condition the plants must be grown on freely without receiving a check in any way, for when once they get a little stunted, they will rarely start afresh, and make pretty plants, and like many other Ferns, they lose their beauty after they get a certain age; therefore, young plants, which may easily be obtained from spores, should be grown. *D. blechnoides* and *D. caudata* are very useful for small fancy pots; the other sorts named above may also be used for the same purpose, but do not stand well enough to be of any great service. In the Fernery, however, they are all well worthy of a place, and when proper attention is bestowed upon them, they have a very different appearance to the stunted specimens often seen in collections. *Pteris.*

## SCOTLAND.

### ROYAL HORTICULTURAL SOCIETY OF ABERDEEN.

A MEETING of the acting Directors of this Society was held on the 6th inst. in the Secretary's office, Bridge Street, Aberdeen, Mr. Alex. Robson, Vice-Chairman, presiding. A list of donations and special prizes was submitted, and considered eminently satisfactory. The best thanks of the Society were ordered to be conveyed to the Town Council of Aberdeen, the Earl of Aberdeen, Sir William Cunliffe Brooks, Bart., M.P., Lord Provost Henderson, Dr. Campbell, M.P., Councillor Lyon, James Murray Gordon, Thomas Ogilvie, Andrew Murray Jun., and others, who have so liberally contributed to the prize fund. The following gentlemen were elected Honorary Directors:—Sir Arthur Grant, Bart.; Dr. Campbell, M.P.; J. D. Milne, Thomas Ogilvie, Andrew Murray, Jun., John Leith, A. R. Gray, John Fyfe, Charles Smith, F. B. Kelly, and Wm. Falconer, Baillie Gordon, Baillie Crombie, Councillor Lyon, A. O. Gill, of Fairfield, and A. M. Ogston, of Ardoe, were elected Honorary Vice-Presidents.

On the motion of the Secretary, Mr. A. M. Byres, a cordial vote of thanks was accorded to Mr. Alex. Robson for his efforts in connection with the prize fund. The prizes were then allocated over the different classes in the schedule, and the schedule ordered to be printed. The annual dinner was fixed for Friday evening, 21st inst., James Murray Gordon, Chairman of Acting Directors, in the chair. Ex-Dean of Guild Walker, and Mr. Thomas Ogilvie will act as croupiers. The usual votes of thanks terminated the proceedings.

### NORTH OF SCOTLAND HORTICULTURAL SOCIETY.

The members of this Association held their monthly meeting on the 7th inst., in the hall of the Christian Institute, Aberdeen. There was a good attendance, and Mr. D. M. Smith, Vice-President of the Association occupied the chair. Mr. Wyllie (of Messrs. Smith & Sons, Aberdeen) read a number of papers on "New Plants, Fruit, Flowers, and Vegetables of the Season." The papers, which were contributed by Mr. Fraser, Kew Green, Surrey; Mr. R. Lindsay, Royal Botanical Gardens, Edinburgh; and several local gardeners, treated the subjects they dealt with in a most interesting and exhaustive manner, and an entertaining and lengthy discussion followed, at the close of which Mr. Wyllie was heartily thanked for reading the papers. A special vote of thanks was awarded the contributors.

## THE WEATHER.

[Accumulated temperature indicates the combined amount and duration of the excess or defect of temperature above or below 32° F. for the period named, and is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

## THE PAST WEEK.

The following summary record of the weather for the week ending Dec. 10, is furnished from the Meteorological Office:—

"The weather has been fairer than of late over our islands generally, but in Ireland considerable quantities of rain have again fallen. In the metropolis and some other parts of England thick fogs prevailed at the close of the period.

"The temperature continued much above the mean

until the 8th, when it fell very decidedly. The average for the week has been 4° above the mean for the time of year in Ireland, from 5° to 7° above in England, and 5° to 8° in Scotland. The highest of the maxima were generally recorded on the 5th, when they varied from 53° in 'Scotland, W.', to 60° in 'Ireland, S.' On the 10th the maxima in some of the south-eastern and central parts of England were very low; at Loughborough and Cambridge the thermometer did not rise above 31°, and in the south of London 33°. The lowest of the minima, which were registered on the 10th, varied from 22° in 'Ireland, N.', to 31° in 'Scotland, N.', and to 41° in the 'Channel Islands.' During the greater part of the time the maxima over the kingdom generally were about 50°.

"Rainfall has been less than the mean over Great Britain, and about equal to it in 'Ireland, N.', but in 'Ireland, S.' a decided excess is shown.

"Bright sunshine has been more prevalent generally than for some time past, but the percentage of the possible amount of duration has continued rather low; in Scotland it ranged from 13 to 15, in Ireland from 28 to 30, and in England from 22 to 28."

## Obituary.

MR. ROBERT CASTLE, of Merton, Surrey, died suddenly on Monday last, at the age of seventy years. He had been engaged in private and commercial gardening for over fifty years, having commenced with his father who had charge of Mr. Swainson's then noted garden at Twickenham, in 1830, and his last charge was at Orsett Hall, Romford, which he left on the death of the owner four years ago. He had a wide practical knowledge of horticulture, and his kindliness of manner gained him many friends, amongst whom, in his youth, he counted London, who, with other leading horticulturists of the time, frequently visited his father at Twickenham.

## VARIORUM.

THE ANNUAL RING IN TREES.—In the course of his last report, the chief of the forestry section of the Agricultural Department of the United States, referring to the annual rings in trees, asserts that these exist as such in all timber grown in the temperate zone. Their structure is so different in different groups of timber that from their appearance alone the quality of the timber may be judged to some extent. For this purpose the absolute width of the rings, the regularity in width from year to year, and the proportion of spring wood to autumn wood, must be taken into account. Spring wood is characterised by less substantial elements, the vessels of thin-walled cells being in greater abundance, while autumn wood is formed of cells with thicker walls, which appear darker in colour. In Conifers and deciduous trees the annual rings are very distinct; while in trees like the Birch, Linden, and Maple, the distinction is not so marked, because the vessels are more evenly distributed. Sometimes the gradual change in appearance of the annual ring from spring to autumn wood, which is due to the difference in its component elements, is interrupted in such a manner that a more or less pronounced layer of autumn wood can apparently be recognised, which again gradually changes to spring or summer wood, and then finishes with the regular autumn wood. This irregularity may occur even more than once in the same ring, and this has led to the notion that the annual rings are not a true indication of age; but the double or counterfeit rings can be distinguished by a practised eye with the aid of a magnifying glass. These irregularities are due to some interruptions of the functions of the tree, caused by defoliation, extreme climatic condition, or sudden changes of temperature. The breadth of the ring depends on the length of the period of vegetation; also when the soil is deep and rich, and light has much influence on the tree, the rings will be broader. The amount of light, and the consequent development of foliage, is perhaps the most powerful factor

in wood formation, and it is upon the proper use of this that the forester depends for his means of regulating the development and quantity of his crop.

## MARKETS.

COVENT GARDEN, December 13.

[We can't accept any editorial responsibility for the subjoined reports, which, however, are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations represent averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and they fluctuate not only from day to day, but often several times in one day, and therefore the prices quoted as averages for the past week must not be taken as indicating the particular prices at any particular date, and still less can they be taken as guides to the prices in the coming week. Ed.]

BUSINESS quiet. All classes of goods well supplied, with no alteration in prices. *James Webber, Wholesale Apple Market.*

## SEEDS.

LONDON: Dec. 12.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, E.C., write that the seed market has this week been largely attended owing to the presence in London of agriculturists who are up for the Cattle Show. For red Clover seed there is an improved feeling, and a few quiet purchases, more particularly of French red, are taking place at the low quotations now current. Alsike, white, and Trefoil are all steady. In Ryegrasses there is scarcely anything doing. Bird seeds are at present low in price and fine in quality. Blue Peas and Haricot Beans realise former terms.

## CORN.

Averages.—Official statement showing the average price of British corn, imperial measure, in the week ended December 8:—Wheat, 31s. 3d.; Barley, 27s. 4d.; Oats, 16s. 9d. For the corresponding week in 1887:—Wheat, 31s. 2d.; Barley, 29s.; Oats, 15s. 11d.

## FRUIT AND VEGETABLES.

**SPITALFIELDS:** Dec. 12.—Good supplies of all kinds of fresh vegetables; Apples, Pears, &c. Trade still very heavy. Quotations—Pears, 3s. to 6s. per bushel; English Apples, 2s. 6d. to 6s. do.; do., 1s. 3d. to 3s. per half-bushel; American do., 10s. 6d. to 21s. per barrel; Guernsey Broccoli, 5s. to 7s. per tally; Cauliflowers, 4s. to 6s. do.; Cabbages, 1s. 6d. to 2s. do.; Savoy, 1s. 9d. to 2s. 6d. do.; Spinach, 1s. 6d. to 1s. 9d. per bushel; Brussels Sprouts, 1s. to 1s. 3d. per half-sieve; Parsnips, 6d. to 8d. per score of 22; Seakale, 1s. 3d. to 1s. 6d. per punnet; Greens, 1s. to 1s. 3d. per dozen bunches; Turnips, 1s. 6d. to 1s. 9d. do.; Carrots, 1s. 3d. to 1s. 9d. do.; Horseradish, 11d. to 1s. 2d. per bundle; Celery, 8s. to 12s. per dozen bundles; English Onions, 4s. to 5s. per cwt.; Belgian do., 2s. 9d. to 3s. per bag; Dutch do., 3s. to 3s. 6d. do.; pickling do., 4s. 6d. to 5s. 6d. do.; Endive, 1s. 6d. to 2s. per dozen; Carrots, 2s. to 3s. per ton; Mistletoe, 20s. to 30s. per large crate; do., 6s. 6d. to 10s. per small crate; Parsley, 1s. 6d. per dozen bunches.

**STRAFORD:** Dec. 11.—Both trade and supply have been good during the past week.—Cabbages, 2s. to 3s. per tally; Savoy, 1s. 6d. to 3s. 10.; Cauliflowers, 1s. to 1s. 6d. dozen; Turnips, 2s. to 4s. per ton; Carrots, household, 2s. to 3s. do.; do., cattle feeding, 22s. to 26s. do.; Mangels, 16s. to 18s. do.; Swedes, 17s. to 20s. do.; Onions, Dutch, 3s. to 3s. 6d. per bag; Watercress, 6d. per dozen; Apples, English, 3s. to 3s. 6d. per bushel; Chestnuts, 8s. to 9s. per bag; Lemons, 5s. 6d. to 7s. per cwt.; Beet-root, 2s. per dozen bunches; Parsnips, 8d. to 10d. per score; Celery, per roll, 1s.; Carrots, 2s. to 2s. 6d. per dozen bunches; Parsley, 2s. do.; Holly, 6d. to 1s. per bundle; Horseradish, 1s. to 1s. 2d. do.

## POTATOS.

**BOROUGH AND SPITALFIELDS:** Dec. 11.—For best qualities the market is firm, but other sorts are dull of sale.—Regents, Scotch, 80s. to 115s.; English, 60s. to 85s.; Hebrons, 65s. to 110s.; Magnum Bonums, 60s. to 100s. per ton.

**SPITALFIELDS:** Dec. 12.—Quotations:—Beauty of Hebron, 90s. to 100s.; Magnums, 65s. to 85s.; Imperators, 75s. to 85s.; Champions, 60s. to 65s.; and Regents, 85s. to 100s. per ton.

**STRAFORD:** Dec. 11.—Quotations:—Regents' 80s. to 110s.; Bats, light soil, 60s. to 90s.; do., dark soil, 55s. to 70s.; Beauty of Hebron, 65s. to 70s.; Scotch Magnums, 80s. to 100s. per ton.

**Imports.**—The imports into London last week consisted of 11,606 bags from Hamburg, 151 from Rotterdam, 576 from Stettin, 4 from Ostend, and 55 boxes from Malta.

## HAY.

**Averages.**—The following are the averages of the prices obtained at the various metropolitan markets during the past week:—Clover, old, prime, 120s. to 147s.; new, 80s. to 110s.; inferior, 30s. to 75s.; prime meadow hay, 115s. to 135s.; good new hay, 60s. to 100s.; inferior, 30s. to 75s.; old straw, 40s. to 48s.; new, 28s. to 42s. per load.

## NOTICES TO CORRESPONDENTS.

**AGRICULTURAL CHEMISTRY AND VEGETABLE PHYSIOLOGY:** A. N. J. W. Either at the Birkbeck Institution, Chancery Lane, W.C.; or at the Polytechnic, Regent Street, W.

**BRITISH PLANTS:** H. L. We do not know of any one who grows complete collections of these plants for sale. You might find many at Mr. Ware's nursery, Tottenham, N.

**CARNATIONS DISEASED:** T. D. The Carnations are infested with microscopic eel-worms, called nematodes. The disease is almost identical with one of the worst forms of Cucumber-disease. For description and illustration of Carnation-disease see *Gardeners' Chronicle* of December 3, 1881, p. 721.

**EFFECTS OF FROST:** A. B. The Cherry Laurel (not Bay Laurel) leaves sent have been injured by frost.

**ERRATUM.**—At p. 678, col. 4, for "sample of Solomon," read Temple of Solomon.

**NAMES OF PLANTS:** J. E. 1, *Thuiopsis borealis variegata*; 2, *Cupressus Lawsoniana erecta viridis*;

3, *C. l. lutea*; 4, *Abies Pinsapo*; 5, *Tsuga Mertensiana*; 6, *Pinus Strobus*.—R. B. 1, *Cupressus sempervirens*; 2, *Juniperus*; 3, *Thuiopsis dolabrata*; 4, *Cupressus Lawsoniana*; 5, perhaps *Picea Alcockiana*, but impossible to say from the specimen sent; 6, *Juniperus*; 7, *Retinospora filifera*; 8 and 9, *Juniperus*; 10, *Sciadopitys verticillata*, variegated form; 11, *Tsuga japonica*, probably; 12, *Juniperus*; 13, a variety of *Thuia orientalis*; 14, *Cryptomeria japonica*; 15, *Thuiopsis borealis*; 16, *Retinospora pisifera*. Another time do not send more than six. The Junipers we cannot name.—R. L. *Pittosporum tenuifolium*.—Hy. *Corder*. *Odontoglossum Insleyi*, probably.—N. N. E. Next week.—W. P. J. *Odontoglossum crispum*, yellow tinted; it may not be constant.—J. P. 1, *Zygopetalum Mackayi*; 2, *Maxillaria gracilis*.—H. J. R. *Nerine humilis*.—J. M. L. Pretty, but nothing remarkable.—W. H. K. *Epipendrum cochleatum*.—S. Taylor. *Canavalia ensiformis*.

**NAMES OF FRUITS:** J. H. I. 53, Warner's King; others so much bruised that they cannot be identified.—J. E. P. 1, King of the Pippins; 2, Ecklinville Seedling.

**ORCHIDS:** J. P. *Dendrobium luteolum* does best in a basket in the warm house. If you would make a good show of the plants, place them together. *Zygopetalum Mackayi* should be kept tolerably dry in a cool house whilst flowering. We advise you to buy a manual on Orchid growing.

**PETROLEUM STOVES:** Correspondent. There is Rippling's hot-water apparatus, as advertised in our columns. Apply to the Albion Lamp Co., Aston Brook Works, Birmingham.

**VINES:** *Grapes*. It is usual to build a wall round a Vine border, to prevent the roots straying into the adjoining land; but it is of questionable use, except in the case of the neighbouring soil being of bad quality. The conditions of a small walled-in area are not so healthy as those of an unfenced one. Numerous cases can be cited of Vines which have borne excellent crops, and the gardener has not been able to say where their roots were, and contrariwise, the whereabouts of every root almost is known, and the crop is of miserable quality. Foster's Seedling, Black Hamburg, and Lady Downe's, will do very well together in the same house, but Madresfield Court would be better by itself—or at any rate where it could be afforded more heat than is necessary for the others.—*Enquirer*. The roots have been long dead, and are covered with small insects; but these are not the cause, but the result of decay. Examine the border. The state of the soil and drainage may be at fault.

## CATALOGUES RECEIVED.

EWING & Co., Sea View Nurseries, Havant—Cheap Collections of Roses.

R. GILBERT, Burligh Gardens, Stamford—Strawberries and Novelties.

CURTIS, SANDFORD & Co., Devon Rosery, Torquay—Trees, Shrubs, Alpines, &c.

N.—G. P.

## ENQUIRIES.

"He that questioneth much shall learn much."—BACON.

**SCARLET WALLFLOWER.**—About three or four months since there appeared an account of such a plant being exhibited at the Royal Horticultural Society, and afterwards advertised in this paper, seed of the above, by a firm of seedsmen. Being desirous of procuring seed, I should deem it a great favour if any of our readers could give me the address. I should also be glad to hear of any novelties in Wallflowers, and where seed or plants can be obtained. *Arthur*. [The term scarlet must be taken relatively.]

## PORTABLE CUCUMBER FRAMES.

R. HALLIDAY AND CO. desire to draw special attention to their Cucumber Frames, of which they always have a large stock, ready glazed and painted. They are made of the best materials, and can be put together and taken apart in a few minutes by any one. Prices delivered to any station in England:—  
2-light frame, 8 feet by 6 feet } 8 s. d.  
3-light frame, 12 feet by 6 feet } Packing { 10 0  
6-light frame, 24 feet by 6 feet } Cases free { 10 0  
The glass is nailed and puttied in. Lights and framing for brick pits at proportionately low prices.

**NEW PATENT (No. 9090, 1888) HORIZONTAL TUBULAR BOILER,**  
Which is, without doubt, the Best All-round Boiler in the Market.

It combines all the advantages of its class so well known, and by the improved method of forming the joints—viz., with India-rubber Washers, the old and too often inefficient way of caulking the joints is entirely dispensed with.

SECTION OF PATENT JOINT

THE LARGEST AND MOST COMPLETE STOCK OF

It can be erected in a few hours, and may be relied upon as a thoroughly sound and good Hot-water Generator. It has been carefully tested in every possible way, more especially with regard to power and durability, and the result has been highly satisfactory.

# TROPICAL AGRICULTURIST,

## A MONTHLY RECORD OF INFORMATION FOR PLANTERS

Of Tea, Cocoa, Cinchona, Coffee, Indiarubber, Sugar, Palms, Cotton, Cardamoms, Kola, Coca, Cinnamon, Nutmegs, Fibrous Plants, and other Products suited for Cultivation in the Tropics.

Published at Observer Office, Colombo, Ceylon, on or about the 1st of each month. Commenced in June, 1881.

THE "TROPICAL AGRICULTURIST" has now an assured position in its large circulation in Ceylon, Southern and even Central and Northern India, the Straits Settlements, Sumatra, Java, Borneo, Northern Australia, Queensland, Central America, Natal, Mauritius, and the West Indies. From all sub-tropical planting settlements we have had cordial approval of the publication and an encouraging measure of support. The English, Indian, and Colonial Press have spoken in commendatory terms of the *T. A.*, as the directors of Public Gardens from Sir Joseph Hooker, F.R.S., downwards, and so have all Planters.

☞ No Planter should be without it.  
**Rates of Subscription, including Postage, in advance:**  
£1 sterling, 10s. 6d. Dollars 5.

Single Copies, 2s. 6d. or 1s. 6d. Back Copies, 3s. 6d. or 1s. 5d.  
Any one of the Four Volumes completed (1881-2, 1882-3, 1883-4, 1884-5), bound in cloth, lettered, with Comprehensive Index, for £1 10s. (or 18s.), carriage prepaid.

## THE TROPICAL AGRICULTURIST.

As a medium for English, American, and Australian ADVERTISEMENTS of goods suitable for the Tropics, Asia as well as Ceylon, the Straits Settlements, Java, and West Indies (Central America being included in that term), or with agriculture, the *Tropical Agriculturist* stands unrivalled, the work being constantly in the hands of Native as well as European and American Agriculturists. Being a Monthly Periodical the *Tropical Agriculturist* lies on the table and is very often referred to during each month—a fact which Advertisers will know how to appreciate.

Mr. W. T. THIBELTON DYER, F.L.S., C.M.G., Director of Kew Gardens, writing of the *T. A.*, refers to it as "an astonishing repository of everything relating to the Economic Botany of the East."

☞ For the Sale of Plants, Seeds, Machinery, Implements, &c., used in Tropical (Tea, Sugar, Fibres, &c.) Agriculture, no better Advertising Medium exists.

#### GARDENING APPOINTMENT.

Mr. CHARLES MARTIN, formerly Foreman at Holkar Gardens, Lancashire, succeeds Mr. MENRITT as Head Gardener at The Hoo, Welwyn, Herts.

**WANTED, A PARTNER**, in an old-established country business, to take the office of Proprietor and Salesman in the Houses. Capital required, £250.—W. S. R., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**WANTED, A HEAD WORKING GARDENER**, where ten or twelve are kept.—Austrian and Christian preferred. Good character. Thoroughly up to Tomatoes, Cucumbers, Mushrooms, Grapes, Peaches, Strawberries, Chrysanthemums, for Market.—Write age, &c., to A., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**WANTED, A FOREMAN**, for the Houses, —Not under 25 years of age; good knowledge of Plants, Orchids, &c. Wages 20s. per week, bothy, and vegetables.—WM. REID, The Gardens, Norbury Hall, Ashburn.

**WANTED**, for the West of England, a steady young Man, as WORKING FOREMAN in the Houses. Must be well up in Growing Cut Flowers, Tomatoes, Cucumbers, Ferns, &c., in quantities for Market.—Apply, stating wage, reference, &c., to W., B. Read, 47, Hart Street, Covent Garden, W.C.

**WANTED, A YOUNG MAN**, thoroughly hard-working. Must be quick, with a good general knowledge of Nursery Work, Inside and Out.—Full particulars and wages required, to W. DAY, Manager, Sandgate Rose Nurseries, Sheffield.

**WANTED, A YOUNG MAN**, quick at Potting and Tying for Market.—Apply at CHILD'S Nursery, New Eltham, Kent.

**WANTED, A GOOD SMART JOBBING HAND**; also a smart girl, age 16 to 20. Good Morals and Education. Home comforts; future studied.—RAYENHILL, 157, Norwood Road, Herne Hill, S.E.

**WANTED, IMMEDIATELY, A SECOND SHOPMAN**, of good address, for a pushing Country Trade. None but a thoroughly competent man need apply. State age and salary expected to N. S., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**WANTED, AN ASSISTANT SHOPMAN**, with a good knowledge of Seed and Bulb Trade.—Apply, stating age, references, and salary required, to B. A., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**WANTED, AN ASSISTANT**, in a Retail Seed and Fruit Shop. Must be steady, pushing, and industrious. Character strictly enquired into.—H. BOXOLD, Banbury.

**WANTED, A DAY STOKER**. A steady man, who has had good experience in management of Fires in a large establishment.—Particulars and references to HUGH LOW AND CO., Clapton Nursery, London, E.

## WANT PLACES.

**NOTICE TO ADVERTISERS**.—In many instances Remittances in Payment of Repeat Advertisements are received, without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Name and Address, and also a Reference to the Advertisement which they wish repeated.

**POSTAL ORDERS**.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable to No. 42, DRURY LANE, to W. RICHARDS, as, unless the number of a Postal Order is known, and it has been made payable to a particular person, and to a particular person, it is impossible to present any person into whose hands it may fall from negotiating it. A.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

**Gardeners, Foresters, Land Stewards.**  
**R. B. LAIRD AND SONS** can recommend with any evidence Scotchmen thoroughly qualified as GARDENERS, FORESTERS, or LAND STEWARDS, either for large or small establishments, and will be pleased to furnish full particulars on application.—17, Frederick Street, Edinburgh.

**To Noblemen and Gentlemen requiring Land Agents, ESTATE AGENTS, BAILIFFS, or GARDENERS.**

**JAMES R. CALVERT AND CO.** have at all times upon their Register a reliable and competent MEN, several of whom are personally well known to Messrs. Carter. Enquiries should be made to 237 and 238, High Holborn, W.C.

**RICHARD SMITH AND CO.** beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

**GARDENER (HEAD)**.—Mr. POPE will have pleasure in recommending a Head Gardener to any Lady or Gentleman requiring an efficient man in all branches of Gardening.—Westfield, Bunchurch, Isle of Wight.

**GARDENER (HEAD)**.—CHARLES DENNING, for past five years Gardener to the Earl of Chesterfield, Holme Lacy, Hereford, seeks re-engagement. Leaving through place changing hands. Had over twenty years' experience in all branches of Gardening, and is a first-class man in the country.—Address as above.

**GARDENER (HEAD)**; age 30, married when last placed, D. LACKAY, Gardener to the Right Hon. Sir Massey Lopes, Bart. can with confidence recommend his Foreman, E. DAWE (previous Foreman to the Right Hon. Earl of Portsmouth), to any Lady or Gentleman requiring a thoroughly practical good Gardener, with fifteen years' practical experience.—PIT, Chudleigh, Devon.

**GARDENER (HEAD WORKING)**.—ALFRED KEMBER, Be-borough, near Cork, offers his services as above. Thoroughly acquainted with every branch of Gardening; and first-class references. English and Protestant.

**GARDENER (HEAD WORKING)**.—Age 29; two years' character. Just left the service of Lord Lansdowne, who is leaving England for India. Previously two and a half years with Viscount Eversley (under Mr. Williams), who can give the best answer inquiries.—GARDENER, 44, Burnaby Street, Chelsea, S.W.

**GARDENER (HEAD WORKING)**, of good SINGLE-HANDED.—Married, no family, thoroughly experienced. First-class references.—J. T. B., 9, Maxwell Road, King's Road, Chelsea, S.W.

**GARDENER (HEAD WORKING)**, or good SINGLE-HANDED.—Age 29, single; ten years' practical experience. Can be well recommended.—W. RICHARDSON, Verandah Cottage, Malvern Wells.

**GARDENER**.—Single; fifteen years' experience in all-round Gardening; has been two years as Head in last place.—G. H., 1, High Street, Highgate, N.

**GARDENER**.—Good all-round man. Several years in present situation. Excellent personal character.—GARDENER, John Hart, Esq., Lochinver, Reigate.

**GARDENER**, where a Second is kept, or thorough good SINGLE-HANDED; age 35, married.—E. MARTIN, Esq., The Elms, Hampton, Middlesex, will be pleased to thoroughly recommend his Gardener to any Lady or Gentleman requiring the services of an experienced and trustworthy man.—Letters to be addressed to the GARDENER, at the Lodge as above.

**GARDENER (SECOND)**, where four or five are kept.—Age 22; eight years' character.—H. G. GOODMAN, 33, Prince Street, Swindon, Wilts.

**GARDENER (SECOND)**, where two or more are kept.—Age 21; four and a half years in last place. Good character.—T. SKINGLE, 32, Northfields, Ealing, W.

**GARDENER (THIRD)**, in a Gentleman's establishment; age 20.—A GARDENER wishes to recommend a steady, obliging young man as above. Knowledge of Garden Work.—GARDENER, Shuttle Lodge, Anson, Hants.

**GARDENER (UNDER)**, in the Houses, in a Gentleman's or Nobleman's place.—Age 20; good reference. Total abstinence.—E. H., 17, Regent Street, Briton Ferry, Glamorganshire.

**GARDENER (UNDER)**.—Age 23; four years' experience in Kitchen Gardening. Two years' good character. Ab-tainer.—W. HILLMAN, New House Cottage, Twineham, near Hayward's Heath, Sussex.

**FOREMAN**.—Thirteen years' experience in first-class establishments.—Address, with full particulars of Glass, wages, &c., C. J., 35, Tectott Road, King's Road, Chelsea, London, S.W.

**FOREMAN and PROPAGATOR**.—Age 34; thoroughly experienced in the Plant and Cut Flower Department, also Rose Growing, and the Nursery Trade generally. Satisfactory references.—L., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**FOREMAN**, or **FOREMAN and SALESMAN**, in good Market Nursery, near London preferred.—Twenty-five years' experience.—W. SMITH, 47, Westville Road, Shepherd's Bush, W.

**HARDY PLANT FOREMAN and SALESMAN**.—Age 25; good commercial knowledge of Hardy Stuff. First-class testimonials, &c., from a leading London firm.—E. O., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

#### To Nurserymen.

**GROUND FOREMAN**.—A young man, of good practical experience, and thoroughly efficient in all branches, seeks re-engagement as above, or could take entire Management. Highest references.—CLM., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**PROPAGATOR and GROWER for Market** or otherwise.—Age 31; sixteen years' experience in the Cut Flower and Plant Trade.—R. A. E., 4, Victoria Street, Lincoln.

**LAND STEWARD, or LAND STEWARD and GARDENER**.—Situation wanted by a practical man (twenty years' experience in the various branches of Estate Management. First-class testimonials and references.—I. K., James Veitch & Sons, King's Road, Chelsea, S.W.

**JOURNEYMAN**; age 21.—Mr. HART wishes to recommend a young man as above. English, Protestant.—J. LITTON, The Gardens, Birr Castle, Parsonstown, Ireland.

**JOURNEYMAN, Inside or Out**.—Age 21; four years in present situation; two under glass. Thorough good character. Industrious and obliging.—H. C., Moreton Gardens, Bideford, Devon.

**JOURNEYMAN**, in the Houses; age 24.—A. RYDON, Gardener to Sir Wm. Ogge, Oakfield, South Dulwich, desires to recommend an energetic, painstaking young man as above.

**IMPROVER**.—Age 17; strong, active. Five years in last situation. Can be highly recommended.—H. DUDMAN, Eldon, Selham, Ludlow, Shropshire.

**Seed, Bulb, and Plant Trade.**  
**IMPROVER**.—Age 21, four and a half years' experience in present situation in good City Firm, where brisk Country Trade is done. Good reference.—W. B., 16 Derby Buildings, King's Cross Road, W.C.

**TO FRUIT GROWERS**.—The Advertiser, thoroughly experienced in Market Work, could undertake entire Management of a large place in the way of Fruit Growing, combined with growing under Glass, Grapes, Cut Flowers, Tomatoes, and all requirements of a First-class Trade demand.—VERAX, 41, Wellington Street, Strand, W.C.

**TO GENTLEMEN and NURSERYMEN**.—Wanted re-engagement in Private Establishment or Nursery; two years' experience in the former and four in the latter in the way of the leading firms. Age 22.—E. G. SPENCER, 4, Francoeur Terrace, Canaan, North, Glamorganshire.

**TO GARDENERS**.—Wanted to place a Lad in a good garden on a premium. Age 17.—W. PRICE, Mr. Trussler, Enfield, Middlesex.

**MANAGER, or SHOPMAN**.—Thorough knowledge of the Seed Trade, Wholesale and Retail. Seventeen years' experience. Good references.—J. CORSEY, Boston, Lincolnshire.

**SHOPMAN, or MANAGER**.—Age 30; thorough knowledge of Seed, Bulb, Plant and Flower Trade. Good references.—SEEDSMAN, 35, Tectott Road, King's Road, Chelsea, London, S.W.

#### To Seedsmen and Florists.

**SHOPMAN**.—Age 28, single; thorough knowledge of Seeds, Bulbs, Plants, &c. Good reference.—G. C. G., North Street, Guildford, Surrey.

**SHOPMAN (ASSISTANT)**.—Age 22; six years' experience. Good knowledge of Seed, Plant and Nursery Trade.—ASSISTANT, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**TO SEEDSMEN**.—Wanted, to Apprentice a Youth (age 16), to Learn the Retail Seed Business.—Apply, stating precise terms desired, to K. TOWNSEND, Seedsmen, Thanet House, Strool.

**FLORISTS**.—Young Lady desires re-engagement. Thoroughly competent. Wreaths, Crosses, Sprays, Bantonnages. Can Manage Branch Business.—Particulars to A. R., 73, Victor Road, Harrow Road, W.

**HOLLOWAY'S PILLS**.—In bilious disorders, sick headache, indigestion, and affections of the nerves, these famous PILLS, now highly appreciated in all quarters of the world, are regarded as the best remedy. They purify the blood, regulate the secretions, give tone to the stomach, restore the appetite, and renovate the system. After a course of these PILLS, the once emaciated and feeble patient is so changed that his friends and acquaintances are astonished. These cheap preservatives of life and health are a blessing to mankind. It would be hardly possible to overstate the good that they have effected, and to discuss which, through mismanagement or neglect, had gained such a mastery over the system that their eradication seemed perfectly hopeless.

# FOSTER AND PEARSON, BEESTON, NOTTS.

## ORCHID HOUSES A SPECIALTY.

## TESTIMONIALS.

From Right Hon. LORD BURTON, Rangmore, near  
Burton-on-Trent.

"Messrs. Foster & Pearson, of Beeston, near Nottingham, have put up a number of houses for us, both in Staffordshire and Scotland. We have every reason to be highly satisfied with the style and quality of their work, especially as compared with that of others whom we have previously employed. Their charges appear to be reasonable—BURTON."

From J. W. BURGESS, Esq., Architect, Chislehurst, Kent.

"Gentlemen,—I am exceedingly pleased with the Conservatory you have erected here."

## SCIENTIFIC PRUNING AND TRIMMING MADE SAFE, EASY, AND RAPID.

## THE GIANT PRUNER.

*The New and Latest Invention for Scientific Pruning and Training on a large scale.*

The great success of the "Standard" Tree Pruner and the "Myticuttah" has induced us to give our attention to the production of a somewhat similar implement, but of a much more powerful construction. In the Giant Pruner you have a tool capable of EASILY cutting a branch 7 inches in circumference, with an exerting pressure of 1½ tons.

Prices and Lengths in future Advertisements.

For Illustrated Price LISTS of above and other Novelties in Pruning Tools, Fruit and Flower Gatherers, &c., apply to the Principal Ironmongers and Seedsmen at home and abroad; or of the

The New and Ingenious Hand to Hand Pruner

## "MYTICUTTAH"

(Registered Trade Mark and Title).

Patented in Great Britain, France, and Germany.

Hitherto, strictly correct Pruning could only be done by holding the branch with one hand and using a Knife with the other, but then only for small branches, whereas the "Myticuttah" itself holds the branch, cutting over an inch in diameter, and in case of prickly bushes, &c., it saves the hands from injury. Garden and Lopping Shears, which hack and bruise the branch, are entirely superseded by this new Patent, and its many advantages will at once commend it to the practical Gardener or Forester.

Sole Proprietors and Makers: THE STANDARD MANUFACTURING COMPANY, ST. ALKMUND'S CHURCHYARD, DERBY.

NEW EDITION, CORRECTED UP TO DATE.

## THE COTTAGER'S CALENDAR OF GARDEN OPERATIONS.

By the late SIR JOSEPH PAXTON, M.P. Reprinted from the *Gardeners' Chronicle*.

**CHUBB, ROUND & CO.,**  
WEST FERRY ROAD, MILWALL, LONDON, E.

**SAVE HALF THE COST.**

**GARSID'S SILVER SAND,**  
BEDFORDSHIRE  
Coarse and Fine.

Is admitted by the leading Nurserymen to be the Best Quality obtainable in the Trade.

Consumers should Buy Direct from the Owner of these Celebrated and Extensive Pits, which contain a practically inexhaustible supply of Splendid Sand, and thus save half the ordinary cost. NO TRAVELLERS or AGENTS.

Apply direct to the Proprietor for Samples and Price. Free on Rail or Canal. All Orders executed with the utmost promptness and under personal supervision. Special Railway Rates in force to all parts.

**GEO. GARSIDE, Jun., F.R.E.S.,** Leighton Buzzard, Beds.

**PEAT for ORCHIDS,**  
AZALEAS, HEATHS, FERNS, RHODODENDRONS, &c.  
The Best in the World.

A. JOHNSON and CO., 23, Leadenhall Street, London, E.C., continue to receive the highest testimonials (unsolicited) from large Orchid Growers, stating the ORCHID PEAT supplied by A. J. & Co. is by far the best they have ever used. Samples can be seen at above address, or forwarded on application free of charge.

**HIGHES' Soluble FIR TREE OIL**

**FLORISTS and NURSERYMEN SHOULD NOT BE WITHOUT IT.**

Unsurpassed as an Insecticide, it kills effectually all parasites and insects which infest plants whether at the roots or on the foliage, without injury to tender plants, such as Ferns, &c. If used as directed. Used as a WASH it imparts the gloss and lustre to the foliage which is so desirable on exhibition specimens.

Dog Fanciers should not be without it! It makes a silky Coat and produces healthy Skin Action; kills fleas, and is excellent for washing dogs.

Housewives should not be without it! Used with ordinary household soap it is an effectual DISINFECTANT, BLEACHER, & CLEANER OF FABRICS.

It kills insect life on man, animal, or plant, without injury to the skin, wherever parasites may appear.

Sold by Seedsmen and Chemists, 1s. 6d., 2s. 6d., 4s. 6d., 1 gallon 7s. 6d., 1 gallon 12s. 6d., or less in larger quantities.

A Treatise on FIR TREE OIL as an INSECTICIDE, its application to Plants and Animals, sent Post free on receipt of address, by the Manufacturer.

**E. GRIFFITHS HUGHES, Manchester.**

Wholesale from all the London Seed Merchants, and Patent Medicine Houses.

NEW YORK—ROLMER & SONS.

**BENTLEY'S INSECTICIDE.**

Is superseding the use of other Insecticides. Used by nearly all the Leading Gardeners. 1 Gallon, 9s.; 3 Gallons, 5s.; 1 Quart, 3s. 6d.; 1 Pint, 2s. Testimonials and full particulars upon application.

**J. BENTLEY.**  
Chemical Works, Barrow-on-Humber, Hull.

**BONES!—BONES!!—BONES!!!**

Crushed Bones in all sizes for Vine Borders, Lawns, Potting, Grass, &c. &c. At lowest prices for Fertility Feeding.

**GARDEN GUANO, DISSOLVED BONES, Special MANURES and FERTILIZERS for all purposes.**

For Prices, apply to  
**HARRISON, BARBER & CO. (Limited),**  
GARRETT LANE, WANDSWORTH, SURREY, S.W.

**PEAT FOR ORCHIDS,**

CHOICE PLANTS, FERNS, HEATHS, AZALEAS, &c.

**EPPS & CO.,** Ringwood, Hants.

**BEESON'S MANURE.**—The Best and Cheapest for all purposes. Write for Circular containing the Leading Gardeners' and Market Growers' Reports. Sold in Tins, 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each, or 1 cwt. Bages, sealed, 13s. By all Seedsmen, or apply direct to **W. H. BEESON**, Carbrook Dole Mills, Sheffield.

**SULPHIDE OF POTASSIUM (Harris).**—A certain cure for Mildew on Plants, Red Spider, Aphids, &c. Enough to make 3s. gallons of solution free for 1s. 3d. The only kind to use is "Harris's specially prepared Sulphide of Potassium." Sole Manufacturers:—**PHILIP HARRIS and CO. (Limited),** 9, Bull Ring, Birmingham.

**JENSEN'S GUANOS** are the most perfect Fertilisers. Promote and Sustain all Growths. Do not Exhaust, but Enrich the Soil. Analyses Guaranteed. Six Prize Medals awarded in 1888.

**J. JENSEN and CO. (Limited),** 109, Fenchurch Street, London.

**GISHURST COMPOUND**, used by leading Gardeners since 1859 against Red Spider, Mildew, Thrips, Green Fly, and other Blights. 1 to 2 ounces to the gallon of soft-water; 4 to 16 ounces as winter dressing for Vines and Orchard-house Trees; and in latter from the cake against American Blight. Has outlived many preparations intended to supersede it. Boxes, 1s., 3s., and 10s. 6d.

**GISHURSTINE** keeps Boots dry and soft on wet ground. Boxes, 6d. and 1s. from the Trade. Wholesale from **PRICE'S PATENT CANDLE COMPANY (Limited),** London.

**SANKEY'S "MARKET POT"** or **LONG TOMS**, the best "Garden Pot" for Bedding Plants and Ornamental Work. The 3-in. Market Pot holds as much as an ordinary 3½-in. pot, thus saving half an inch more for each pot. Five sizes, 3 in., 3½ in., 4 in., 4½ in., and 4¾ in., all more or less upright, an inch to 1¼ inches deeper than usual, very strong and much lighter in weight—the very pot for Market Growers; great economy in room and weight. Largest Stock in United Kingdom.

**RICHARD SANKEY and SON**, Salwell Pottery, Nottingham.

**PASCALL'S PATENT PROPAGATOR**

Made in superior earthenware, 14 in. long, 6½ in. deep, and 6 in. wide. Inside, 2½ inches from the top, is a perforated movable false bottom, upon which the soil for cuttings or seeds is placed, the lower half being filled with water, which is replenished when required through the funnel. It fits evenly on 4-inch hot-water pipes, and will be found a simple and effectual means of utilizing them for propagating purposes. With the false bottom removed it forms an effective vaporiser. Price 3s. each, six carriage and package free to any station in Great Britain for 21 1/2s.; or two for 3s. 6d. Sole makers and patentees, **T. PASCALL and SON**, 24, New Kent Road, Surrey, S.E.

**Garden Pots.** Ours are unsurpassed by any in the Trade. **£3 orders** carriage paid to any goods station within 100 miles of London. Samples carriage free. Orchid Pottery of every description. Send for Price List.—**T. PASCALL & SONS**, South Norwood Pottery, Surrey, S.E.

**STOVES.**

**Terra-Cotta! Portable! For Coal! ROBERTS' PATENT (IMPROVED),** for Greenhouses, Bedrooms, &c.

**GREENHOUSES** heated by the **ROBERTS' PATENT TERRA-COTTA STOVES** for COAL give pure and ample heat with common coal, or coal and coke. For Greenhouses, Bedrooms, &c. Pamphlets, Drawings, and Testimonials sent free.

See in use at Patentees',  
**THOMAS ROBERTS,**

BAXTER, W. H., Botanic Gardens, Oxford.  
BLAIR, T., Shrubland Gardens.  
CARMICHAEL, A. M., Henley in Arden.  
CHALLIS, T.  
CHRISTIE, A., Warwick Castle.  
COLEMAN, W., Easton Castle Gardens.  
COOMBER, J., The Hendre, Monmouth.  
COOMBER, W., Regent's Park.  
CROSSING, R., St. Fagan's Castle Gardens.  
CULVERWELL, W., Thorpe Perrow.  
DEAN, A. (Potato, &c.).  
DEWAR, D., Royal Gardens, Kew.  
DIVERS, W. H., Ketton.  
DOUGLAS, J., Great Gearies, Ilford.  
DUNN, M., Dalkeith.  
EARLEY, W., Ilford.  
EVANS, A., Lythe Hill Gardens.  
FINDLAY, B., Manchester.  
FISH, D. T., Hardwicke Gardens.  
FOWLER, A., Castle Kennedy Gardens.  
GIBSON, W. M. (Town Gardening).  
GRIEVE, P., Bury St. Edmunds.  
HEMSLEY, A. (Market Plants).  
HERRIN, C., Droppore.  
HUDSON, J. (Stove Plants).  
INGRAM, W., Belvoir Gardens.  
LYNCH, R. J., Botanic Gardens, Cambridge.  
MCINDOE, J., Hutton Hall.  
MELVILLE, D., Dunrobin Gardens.  
MILES, G. T., Wycombe Abbey.  
MILLER, W., Coombe Abbey.  
MOORE, F. W., Royal Botanic Garden, Obrien, T. [Glasnevin].  
POWELL, D. C., Powderham Castle.  
RICHARDS, G. H., Somerley Gardens.  
ROBERTS, J., Gunnersbury.  
ROSS, F., Fendell Court, Bleichingley.  
WEBSTER, J., Gordon Castle Gardens.  
SAUL, M., York.  
SHEPPARD, J., Wolverston Gardens.  
SMITH, J., Mentmore Gardens.  
SMYTHE, W., Basing Park.  
TEMPLE, M., Carron House, N.B.  
THOMAS, O., Chatsworth Gardens.  
THOMSON, W., Clonsceter (Vines).  
WALLIS, J., Keele Gardens.  
WARD, E., Hewell Grange, Bromsgrove.  
WARD, H. W., Longford Castle Gardens.  
WARD, A., Stoke Edith Park.  
WATSON, W., Royal Gardens, Kew.  
WEBSTER, J., Gordon Castle Gardens.  
WILDSMITH, W., Heckfield Gardens.  
WILSON, D.  
WILSON, G. F. (Lilies).

### ROSES:—

BENNETT, H.  
BONAVIA, Dr. N. W. H.  
FISH, D. T., Hardwicke, Bury St.  
FISHER, Rev. O. [Edmunds].  
GILBERT, W. W.  
PAUL, G., Cheshant.  
PAUL, W., Waltham Cross.

### VEGETABLE PHYSIOLOGY:—

BENNETT, A. W.  
BOULGER, Prof.  
DARWIN, Charles, the late.  
FOSTER, Prof. Michael.  
GARDINER, W., Cambridge.  
GLADSTONE, James (Meteorology).  
HUNTER, Rev. G.

## ORCHIDS AND PALMS

### SPECIALTIES.

The Stock is of such magnitude that, without seeing it, it is not easy to form an adequate conception of its unprecedented extent.

**FRUIT TREES, ROSES, AZALEAS, CAMELLIAS, BOUVARDIAS, CYCLAMENS, ERICAS, EPACRIS, SOLANUMS, TREE CARNATIONS, and other WINTER and SPRING BLOOMING PLANTS,** of fine quality and immense numbers.

### INSPECTION INVITED.

The Glass covers an area of upwards of 300,000 super. feet.

**HUGH LOW & CO.,**  
CLAPTON NURSERY, LONDON, N.

## FRUIT TREES, SEVENTY-FOUR ACRES.

**APPLES, PEARS, PLUMS, CHERRIES, PEACHES, NECTARINES, APRICOTS, and other FRUIT TREES,** as Standards, Dwarfs, Pyramids, Bushes, Cordons, and Trained Trees in great variety.

**VINES, excellent Canes,** 3s. 6d., 5s., 7s. 6d., 10s. 6d. Orchard House Trees, 12s., 15s., 20s., 25s., 30s., 40s., 50s., 60s., 70s., 80s., 90s., 100s., 120s., 150s., 200s., 250s., 300s., 400s., 500s., 600s., 700s., 800s., 900s., 1000s., 1200s., 1500s., ## Notice to Advertisers.

## THE GARDENERS' CHRONICLE

FOR

JANUARY 5, 1889,

WILL CONTAIN AS A

## SUPPLEMENT

AN

INK PHOTOGRAPH

OF THE

## GRAND CASCADE

WILHELMSHÖHE, near CASSELL;

ALSO A

## Sheet Almanac.

As a large EXTRA circulation of this

Number is guaranteed, it will be a very  
valuable medium for Advertisements.

Advertisers desirous of securing space in  
this Number are requested to communicate not  
later than DECEMBER 31, with the Publisher,

W. RICHARDS,

41, WELLINGTON STREET, STRAND,  
LONDON, W.C.

ECKFORD'S NOVELTIES IN  
SWEET PEAS FOR 1889.

**ECKFORD'S NEW SWEET PEA QUEEN OF ENGLAND.**—White, of large size and good substance. In sealed Packets of 25 seeds, 1s. each.

**ECKFORD'S NEW SWEET PEA DELIGHT.**—Wings white, standards white, beautifully crested with crimson. Small. Very pretty. Dwarf habit. In sealed Packets, 25 seeds, 1s. each.

**ECKFORD'S NEW SWEET PEAS.**—A mixture of eight distinct varieties, 3 seeds of each. In sealed Packets, 1s. each.

**ECKFORD'S NEW MIXED SWEET PEAS.**—Special strain, saved from choice unnamed varieties of Mr. Eckford's raising, and includes many of great merit. In sealed Packets of 25 seeds, 6d. each.

*These Novelties can be had only from H. E., and the undernamed Agents.*

## VARIETIES SENT OUT IN 1888.

**ECKFORD'S NEW SWEET PEA SPLENDOR.**—Awarded a First-class Certificate by the Royal Horticultural Society. Colour rich bright pinkish-rose, shaded with crimson. Flowers large, and of the finest form. A superbly distinct variety. In sealed Packets of 25 seeds, 1s. each.

**ECKFORD'S NEW SWEET PEA APPLE BLOSSOM.**—The standards bright pinkish-rose, the wings blush, a beautiful shade of Apple blossom. Very pretty and distinct. In sealed Packets of 25 seeds, 1s. each.

ECKFORD'S NOVELTIES IN  
CULINARY PEAS FOR 1889.

**ECKFORD'S NEW CULINARY PEA THE DON.**—Awarded a First-class Certificate by the Royal Horticultural Society under the name of Quality. A Wrinkled Marrow, producing abundantly deep green, square ended, well-filled pods. A Ne Plus Ultra like Pea, of exquisite flavour, coming into use earlier than Fame. Height 4 feet. In sealed Half-pint Packets, 2s. 6d. each.

**ECKFORD'S NEW CULINARY PEA HEROINE.**—A Wrinkled Marrow, of robust growth. Height, 2½ feet. Second early, producing most abundantly long pointed, well filled pods. Flavour exquisite. Fine for field culture. In sealed Half-pint Packets, 2s. 6d. each.

**ECKFORD'S NEW CULINARY PEA ESSENTIAL.**—A Wrinkled (the early) Marrow. Height 5 feet. Produces abundantly square handsome, well filled deep green pods, the Peas retaining their beautiful deep green colour when cooked. Exquisite flavour. A great acquisition. If sown in pots in January and planted out in March may be had very early. Stock limited. In sealed trial Packets, 2s. 6d. each.

## VARIETIES SENT OUT IN 1888.

**ECKFORD'S NEW CULINARY PEA FAME.**—Awarded a First-class Certificate by the Royal Horticultural Society. A Main Crop Wrinkled Pea, growing 4 feet, producing profusely deep green, square-ended, well-filled pods. An improved Ne Plus Ultra, coming into use much earlier than the fine old variety of that name. Flavour exquisite. In sealed Half-pint Packets, 2s. each.

**ECKFORD'S NEW CULINARY PEA SHROPSHIRE HERO.**—Awarded a First-class Certificate by the Royal Horticultural Society. A Wrinkled Pea of robust growth. Height 2½ feet. Second early. Produces abundantly long, square, handsome, well-filled pods; well adapted for Market Growers. Flavour exquisite. A great acquisition. In sealed Half-pint Packets, 2s. each.

*Wholesale Agents for the above:—*

Messrs. HURST AND SON, 152, Houndsditch,  
London, E., for Great Britain and Europe;

Messrs. PETER HENDERSON AND CO., 35  
and 37, Cortlandt Street, New York, for the  
United States and Canada.

*Retail of—*

**HENRY ECKFORD,**  
BOREATON, BASCHURCH.

## PANSY.

H. Eckford offers seed of the Boreaton Strain.

Highly commended by the Royal Horticultural Society.

In 1s., 2s. 6d., and 5s. Packets.

*Price to the Trade on application.*

NEW EDITION,  
Corrected up to Date,  
**THE COTTAGER'S CALENDAR**  
of  
**GARDEN OPERATIONS.**

Price 3d., Post-free 3½d.

THE

## Gardeners' Chronicle.

SATURDAY, DECEMBER 22, 1888.

## KNIGHTSHAYES,

THE Devonshire seat of Sir John H. Heathcote-Amory, Bart., is charmingly situated within sight of Tiverton, but not too near it, in the narrow valley of the Exe, and high up on the bank, from which it looks across a fertile, sloping park, full of large timber, down to the river, across the country southwards—a beautifully wooded, rich and pastoral country—and down the little valley to the half-hidden town whose several shafts and towers are seen among the trees.

We are here in the pleasant county of Devon, in the latitude of Apple orchards and of good cider and perry. Sir John's home-farm, which I came down here to visit for the sake of its Devon cattle and prize-winning Devonshire breed of sheep, has not less than 30 acres in Apple orchards, which produce in good seasons no fewer than 400 to 500 hogsheads of cider, though this year, unfortunately, not more than 50 hogsheads are expected; and the haymakers, thinking of sunshine and heat next year—though they have been very sparingly vouchsafed in the present season—are beginning to fear that the customary four quarts per head per diem may fail them, and that the seasoned barrels they bear about for the holding of all this liquor, and of considerably more sometimes in long days, it is said, may have to be filled with something inferior to their usual beverage.

There is no better test of climate than the character of the vegetation. We are not only in a pastoral district here, but in what farmers call a "grassy" country—that is, grasses and weeds spring very freely in the corn stubbles: a proof of a humid atmosphere. Ferns and mosses grow freely in the lanes. Barley is sown a month later than in Essex that it may not be injured by those destructive hoar frosts which cold and

moisture occasion in unsheltered fields. But the winter is far milder than in Essex. A Devonshire gentleman told me that his Peaches and Apricots thrive the worse, he thought, for want of a colder winter, which would ensure the complete rest of the trees. I think he may be right, for a laird in Orkney told me that the Tamarisk, which forms good seaside hedges on the Sussex coast, is not sufficiently put to rest in Orkney, where the Gulf Stream rarely allows of twenty-four hours frost, and where the little lochs, exposed as they are, are seldom covered with ice as thick as a sixpence.

But you may see at a glance that tender shrubs thrive at Knightshayes, and that the winters must be mild. The house, which is a large one, built by the present owners on an old site, is exceedingly well clothed with ornamental shrubs and creepers, which I could not examine with Mr. Peebles, who manages the fine gardens here, and seemed very willing to show me round, till the daylight was almost spent. By dint of straining one's eyes and feeling the foliage, we made out several things, till presently I laid hold of something very prickly, when we both agreed it was time to desist.

But even in the gathering darkness I could see that the front and sides of the great house were beautifully covered to a considerable height—painted, so to speak, in the best possible colours for house walls by the tasteful hand of the planter. I may mention among the wall plants various Magnolias, Myrtles, Escallonia—always a welcome shrub with the most cheerful bright green leaves—Viburnum Sieboldi, Stauntonia latifolia, and Azara macrophylla, only two years planted, but 12 feet high and 5 feet across, with leaves bright and glossy, and small pale berries, which I could not distinguish in the dusk. There were specimens of Berberis, common perhaps, but beautiful, and a number of Roses, some of them with very sharp prickles, I should think! Then another evergreen grows here which is comparatively rare, though I planted it, and had it killed by frost, only forty miles from Middlesex, thirty years ago. I mean that exquisite flowering shrub Desfontainia spinosa, which all should grow who can.

The demand for flowers at the town house and here was suggested, and the skill of the gardener displayed to my eyes by the sight of 500 pots of Chrysanthemums, which were then out-doors, to be flowered in the various houses. All the leading sorts are here, especially those which are particularly suitable for decorative purposes. The plants are all in 14-inch pots, and their size and vigour are so great that each pot has been furnished with about twenty-five canes, to which the stems are tied. One of the greenhouses is beautifully decorated with Palms and foliage plants, Adiantums, and two specimens of that most graceful of all trees—if, in deference to Humboldt's opinion, we except the Tree Ferns—the Araucaria excelsa, in full foliage, the lower branches drooping over the pots. Two trees of this species are here in good foliage, though they stood in the drawing-room two months during last winter.

Mr. Peebles is a great fancier and successful raiser of the Coleus, and has sent out this year two new kinds—C. majesticus and C. Miss Jane Thomson, a light coloured beauty. Last year he brought out Lady Amory, which is now in Mr. B. S. Williams' catalogue, and he has now half-a-dozen unnamed sorts of different strains, which will shortly be consigned to Mr. Williams to be exhibited by him at the meetings of the Royal Horticultural Society. The gorgeous colouring

of these seedlings is far beyond my powers of description. Who shall name the shades of colour which their leaves present?

A plant to arrest the attention, and one which the ancients would have worshipped, stands in one of the houses. It is a three-year-old Allamanda, which I may describe as columnar in shape, growing in a No. 1 pot, 11 feet high, and loaded with hundreds of the well-known pale soft yellow blossoms of this beautiful climber. In order to keep the plant upright and to give it the form of an Azalea on exhibition its branches have been tied to several stakes set in the pot.

The vinery is divided into five houses, and among them is a house of Muscats that was a credit to the gardener who grew them. They were in the highest perfection, ripe and ripening, almost every bunch fit to be cut as a specimen, and the number of bunches so great that the cutting of 40 lb. the other day caused no gap in the crop of many hundredweights. The second house contains White Syrian, Golden Queen, and other sorts, three years planted; and another is remarkable for Muscat canes of this year's growth 20 feet long.

The second crop of Figs was ripening in one of the houses. Peaches abound here. The houses being wide, they are planted on trellises 12 feet apart, and crossing the houses from front to back, so that the sun is always on the fruit. In the case of one tree ten Peaches were touched by the extended fingers in spreading out the hand; two dozen had been taken from that tree in the morning, and a big crop remained of Peaches of good size. The same tree bore a great crop last year.

I omitted to mention before leaving the vinery that Black Alicante is a great favourite here as a late Grape, and is well grown. White Frontignan is grown here as a "tasty" Grape. The sorts of Peaches are Hale's Early, Noblesse, Bellegarde, Dr. Hogg, Grosse Mignonne, Sea Eagle, &c. H. E.

## SPECIMEN TREES IN KEW GARDENS.

**ARBUTUS ANDRACHNE.**—The usual height of this ornamental evergreen tree is cited at 10–14 feet, but the specimen which we now figure (fig. 100), and which is growing in the Royal Gardens, Kew, has a height of 20 feet, a spread of branches of 20 feet, and a girth, at 2 feet from the ground, of 3 feet 8 inches, so that it cannot be much inferior in size to the native specimens in Greece. A peculiarity of this tree is that the outer bark peels off in large flakes, leaving the newer bark exposed. The smoothness and rich brown-pink hue of the newly-exposed surface is very beautiful. We have not as yet heard of the occurrence, but we have no doubt that some indignant ratepayer will some day indict the authorities at Kew for their barbarity in removing the bark of this tree, just as it is not uncommon to see protests in the newspapers against the supposed mischievousness of little wanton boys in removing the bark from the Plane trees in the London parks. The present species is a native of the Levant, and was mentioned by old Greek writers. The proper spelling is said to be andrachne, or in modern Greek, arachla. The fruit is similar to that of the Irish Arbutus Unedo, and the wood is used for fuel and other purposes in its native country. The leaves are longer than those of the common Arbutus, not so jagged at the edges, and smoother on the surface; the flowers are white and bell-shaped, something like those of the Lily of the Valley in size, form, and colour, and arranged in dense terminal panicles. Arbutus Unedo, the common Strawberry tree of Killarney, U. hybrida, and U. procera, are all worth growing as

handsome evergreens; while the red berries of A. Unedo give it an additional claim to the attention of the planter. The present species rarely fruits in this country, and, indeed, is somewhat tender when young.

## NEW OR NOTEWORTHY PLANTS.

### CLEISOSTOMA RINGENS, n. sp.\*

This very interesting little gem was imported with Phalenopsis Sanderiana, no doubt by Mr. F. Sander. I had it from Mr. James O'Brien. It has very few ligulate, emarginate leaves which are equal to those of a small Phalenopsis grandiflora, Lindl. (O.Br.). Thus they are 3–4 inches in length,  $\frac{1}{2}$  inch in breadth. The leaf in my herbarium is shorter. Even in the dried state it shows very well the strong and cartilaginous state it had when alive. I believe the leaf had a purple hue above, but I say this from memory only, having made no note about it. The purple peduncle bears very few flowers (I saw two), which I found one-sided, and which are the size of those of Phalenopsis Parishii. The stalked ovaries are light ochre-yellow. The sepals are ligulate, blunt acute. The petals much narrower, acute, of the same length. Spur of the lip very large, broad, cylindrical, emarginate at the retuse apex. Side lacinia retuse very short. Mid-lacinia oblong apiculate, or three-lobed, blunt or emarginate, full of very inconspicuous small warts. There is a large callus under the column. It is oblong, like an anchor near the column, having on each side a projecting shank-curved downwards and an emarginate bilobed end towards the extremity of the spurs. There is also a Sarcanthoid septum in the spur. Column slender with a very long rostellar beak. Sepals and petals ochre-yellow, base of the column purple in front. Mid-lacinia of lip purple. There is an orange spot on each side of the side-lacinia. Alas! I had no other. I always waited for fuller materials. Mr. O'Brien, however, who appears to have an unrivalled memory, has regularly praised his pet, I believe every third month since September, 1883; so that finally I do what is wanted. H. G. Rebb. f.

### CYPRIPEDIUM BURFORDENSE X, n. hyb. Angl., orig. dubi.

This appears to be a totally unknown hybrid, though it is a very difficult task to affirm this. The leaves are said to be like those of Cypripedium Barteli X, but to be about one-third broader, one-third shorter, as well as a little thicker. The peduncle is dark reddish-brown, covered with short velvety hairs. The bract is less than half the length of the ovary; it has a very sharp dorsal keel and dark lines of nerves. The ovary is a little lighter than the peduncle. The upper sepal is very large cuneate elliptical acute, of a very light rosy mauve hue, excepting the tip, which is adorned with a white nearly rhombic patch. There are seventeen strong dark purple nerves. The connate sepal is whitish oblong ligulate acute, exceeding the length of the lip. Descending petals light greenish at the base, with superior border of the lightest purple, and brownish-purple on the anterior or exterior somewhat dilated part, its nerves green. There are some purple hairs at the base and cilia around the border. Near the superior margin are two very dark mauve-purple lines, and this is, as far as I know, quite novel. In addition to these there are very few (four in the flower at hand) mauve-purple exceedingly short narrow spots or lines. The lip is of the shape of that of Cypripedium Argus, brown-ochre-colored underneath, with a yellow border around the mouth

\* *Cleisostoma ringens*, n. sp.—Foliis ligulatis apice bilobis brevibus, valde cartilagineis racemo paucifloro, secundifloro; sepalis ligulatis obtusis acutis; tepalibus lanceolatis acutis, labelli calcaris amplo apice retuso nunc emarginato, callo carnosio sub columna basi sub columna utrinque retroversum uncinaria, cruribus calcaris apice spectralibus, apice versus calcaris apicem emarginato, septo. Sarcanthideo procalcaris; columna gracilis. Ex insulis Philippinis. H. G. Rebb. f.

of the spur; the inflexed margins of the stalk ochre coloured, with small red spots. The greatest part of the lip is reddish-brown of the usual tint. The saminode is nearly like that of *Cypripedium Argus*, but the lateral teeth are shorter than in *Cypripedium Argus*. Both the vexillar dorsal sepal and the lines on the petals are very remarkable. It was kindly sent me by Sir Trevor Lawrence, and is a seedling raised at Burford Lodge. It remains in flower a very long time. When I obtained the flower through Mr. F. Sander it had been expanded for four weeks, and then it was kept in good order in a glass for three weeks.

*Cypripedium Barteti*, of which Mr. Sander kindly sent me fresh leaves, has the light garlic-green colour with darker, but with very light angular markings

all be correct, as I do not doubt, I can never believe in the plant being a variety of *Dendrobium cariniferum*. I had, however, no other materials. On January 17, 1887, Mr. F. Sander sent me a few dried flowers collected in Upper Burmah by his traveller, Mr. Michalitz. If the collector had added a piece of the stem and leaves naming might have been possible. What an immense sum has been lost by the neglect to send sufficient materials! and with what gratitude must we regard such collectors as the two Lobbs, Fortune, Lehmann, Forstermann, and others, who kept in view the interests of their patrons, of their own honour, and of science. Mr. Michalitz, excepting this lack, is, as I learn, a very careful collector, and informed Mr. F. Sander that he had been told by Mr. Boxall that the plant was my *Dendrobium*

indication may be understood from the poor garden plant not displaying the full extent of its black hairy surface, its ornament in its natural state.

The thickness of the stem at hand is that of a large goosequill. Leaf-blades 3 to 4 inches long by 4 lines in breadth at the broadest diameter; linear ligulate, cuneate at the base, and tapering into a narrow, sharply, bidentate apex. The leaf-blades are rather thin, and when dried prominently nerved. The leaves of *Dendrobium cariniferum* have the blades three or four times broader, blunt bilobed at the apex which is very little narrower. The short ligulate acute bracts of *Dendrobium Wattii* are quite covered with black hairs at the period of the development of the flowers—three in one raceme in the specimen kindly given me by Sir Trevor Lawrence. The flowers are

FIG. 100.—*ARBUTUS ANDRACHNE* AT KEW. (SEE P. 724.)

like those found in the group of *Cypripedium venustum*.

It is supposed to be a hybrid between *Cypripedium Argus* and *C. philippinense* (lævigatum). There is much resemblance to *Cypripedium Argus*. The latter species might have given the very thick leaves. *H. G. Rehb. f.*

**DENDROBIUM WATTII**, *Rehb. f.*: **DENDROBIUM CARINIFERUM** VAR. **WATTII**, *Hook. f., Bot. Mag.*, 1883, t. 6715.

This is regarded as a variety of my *Dendrobium cariniferum*, by Sir Joseph Hooker, who gave a careful description as well as several remarks, and a very good portrait was made by Miss Smith in the magazine above noted.

My knowledge of the plant began with the inspection of the documents published by Sir Joseph. If

*virginicum* (see *Gardeners' Chronicle*, xxii., n.s., October 5, 1884, p. 520), a plant that has so far proved a monopoly with Messrs. H. Low & Co. This was a mistake. *Dendrobium virginicum* has the broad leaves of *D. cariniferum*, but a short blunt chin, shorter, blunt acute sepals and petals, and two callous lines on the disc of the lip, between the side lacinia, reaching only to the base of the mid-lacinia. And now, after five years' suspense, by the kindness of Sir Trevor Lawrence, Bart., I have nearly fully satisfactory materials at hand! An old stem, the fine leaves, and a three-flowered raceme on the old stem. I lack only the young sheaths, which are said by Sir Joseph to be faintly hairy. The old furrowed stem is more than a foot long, covered with light ochre or sepia coloured sheaths, covered with very small black points. If those are, as I feel inclined to believe, the bases of the fallen hairs, then Sir Joseph's

equal in size to those of a good *Dendrobium cariniferum*. They are of the purest snow white. The thickened median ligulate patch on the disc of a fine cinnabar colour, running on to the superior part of the anterior lacinia, white at the base only. There are few nerves on the lateral lacinia covered with cinnabar colour. The mentum (chin) is sordid reddish-brown. The stalked ovary is quite white. There is some light brown colour at the base of the column where the lip ceases to be adnate. The whole flower lacks the plump shape of that of *Dendrobium cariniferum*. Its slender chin is quite straight. The dorsal sepal is lanceolate-acute. The lateral sepals are triangular acute without the least vestige of the keels that induced me to give the name of *cariniferum*. Petals oblong apiculate (acute in *Dendrobium cariniferum*). This character has been very well represented by Miss Smith, *l.c.* The

lip is narrower than in *Dendrobium cariniferum*, mid-lacinia protruded, cuneate, obovate, emarginate, apiculate, toothed on the borders without the slightest vestige of hairs, or of the strong asperities which are so abundant on the inner surface of the lip of *Dendrobium cariniferum*. The colour of the flowers of the last-named plant is white with mentum and tips of the sepals, side-lacinia and disc ochre-coloured. My variety, lateritium, kindly sent by Mr. F. Sander in 1883, has the discs of the lip brick-red.

The new plant is stated by Sir Joseph Hooker to have been sent by Dr. Watt, F.L.S., from Manipore.

I may be permitted to suggest the possibility of the plant being a hybrid between *Dendrobium Jamesianum*, Rehb. f., and *D. flexuosum*, Griff. *H. G. Rehb. f.*

## DEVONHURST, CHISWICK.

THIS, the pretty suburban residence of E. H. Watts, Esq., will long be a famous spot, it having formed at one time a part of the Arboretum of the Horticultural Society in its early days when its collectors sent home the rare, beautiful, and fine trees, which now enrich our collections, such trees as probably will not be found in a place of its extent (11 acres) elsewhere in the country. I will note some of the more striking specimens observed on the occasion of a recent visit to the place. On the west side of the house stands a Mahaleb Cherry, one of the finest specimens in the country. It has a large spreading head, and its branches sweep the ground; its height is 35 feet, 50 feet through the branches, the principal of which are bound together with iron rods. When in flower, it is entirely covered with its beautifully scented white flowers, and forms a fine object. On the south side of the house are fine specimens of Beeches—purple, and the cut-leaved (*Fagus sylvatica icusica*). The trees have had plenty of room in which to develop, and are now grand specimens, from 60 to 70 feet in height.

A little further south is a fine variety of the Copper Beech, which in the early summer presents a great contrast to the foliage of the surrounding trees. Adjoining the Beech trees on the lawn is a fine symmetrical specimen of the Horse Chestnut, about 70 feet in height. In close company is also found a fine example of *Tscusula rubicunda*, about 45 feet high, with a dense round head. The tree flowers freely, generally producing large quantities of fruit. A little to the south of the last mentioned is a tree of *Ailanthus glandulosa*, about 70 feet in height. It is branched out in three main stems close to the ground. Adjoining is a notable group of three trees of *Gleditsia*—*G. triacanthos* is the tallest, being about 60 feet in height. This tree generally produces fruit freely every season, but this year has proved an exception to the rule. When in fruit, it forms a very ornamental tree, its long pods being very conspicuous when the sun is shining; *G. sinensis* is about 30 feet in height—this, when in flower, emits a strong perfume, somewhat resembling that of Mignonette, the stem of the tree is thickly covered with long prickly spines, giving it a distinctive aspect; *G. sinensis inermis*, 35 feet high—the flowers of this are incomplete, therefore producing no fruit.

A fine group of eight *Fraxinus* next attract attention, *F. angustifolia*, being the tallest, about 55 feet in height. Near here is a good specimen of *Pinus Pallasiana*, which, with a good specimen of the Scotch Fir, about 70 feet in height, are nearly all the Conifers which have survived the London fog and smoke. But it may be remembered that *Cedrus Libani* and *C. atlantica* are exceptions, and grow fairly well here—the last named generally coning freely: this year, however, it has not done so.

Near some Ash trees are two Oaks planted close together—*Quercus cerris fulhamensis*, and *Q. c. fulhamensis latifolia*. Curiously enough, the last named retains its leaves in a withered state until spring. Close by here is a specimen of *Pyrus sorbus*, about 55 feet in height, which generally produces fruit freely. Along the south side of the grounds are some large trees of *Pavia rubra*, *P. flava*, and *P. carnea*.

The stocks (common Horse Chestnut) these are worked on have grown much larger than the scions. There are also some Elms which have attained considerable dimensions. *Ulmus campestris foliis variegatis* sends up its variegated suckers freely at a considerable distance from the main stem. On the east side of the ground are the large Elms, including varieties of *U. montana* and *campestris*, the highest being about 80 feet. Here also are a few fine trees of *Tilia alba*, which, when the wind is blowing, forms a pleasing object in the landscape, the silvery under-side of the leaf looking very pretty as it is turned up by the wind.

In this quarter, too, we find some good specimens of the Oak, there being over two dozen varieties—*Q. cerris*, *Q. pedunculata*, *Q. sessiliflora*, *Q. ilex*, *Q. suber*, &c., all forming large trees. Towards the lawn tennis ground are some fine Maples, including *Acer Pseudo-platanus*, the golden *Acer* (or *Corstophine Plane*), remarkably pretty in early spring, with its golden-yellow foliage, showing to great advantage amongst the surrounding sombre foliage. A *p.-p. variegata*, *A. heterophyllum*, *A. macrophyllum*, a noble example, being 72 feet high, 10 feet in girth, diameter of spread of branches, 60 feet; *A. monspessulanum*, *A. palmatum*, *A. platanoides*, and the Ash-leaved Maple, *A. negundo fraxinifolium*, which has a spread of branches 66 feet though. Here is also a fine specimen of the Butter Nut (*Caryamora*), also two fine clumps of *Quercus ilex*, and a good specimen of the Hornbeam (*Carpinus betulus*). Close by the house is a very handsome tree of the Sweet Chestnut.

Along the east side of the grounds is a deep belt of evergreen and flowering shrubs, and amongst them are planted standard trees of Apples and Plums, which, when in flower, produce a most pleasing effect, and when in fruit are likewise very ornamental, to say nothing of their use. This idea might advantageously be followed in similar positions in a great many more instances than at present appears to be the fashion.

Regarding Apples, we noted a nice quarter of young pyramids on the Paradise stock, planted about four years, showing flower-buds remarkably well.

The attractions of Devonhurst are not wholly confined to the outdoor department. There is a nice range of glass. Mr. Watts is taking up the cultivation of Orchids. The Cattleyas are looking very healthy, and are showing well for flower. *Cypripedium*, *Odontoglossum*, *Lælia*, &c., give a welcome glow of colour.

Foliage plants are well done. A good table plant is *Aralia Chabrierii*, a charming show species, represented here by an extremely graceful example. It only remains to be added that the place is under the excellent management of Mr. Alexander Wright. *B.* [We are indebted to Mr. Wright for the following measurements of trees in this garden:—*Quercus suber*: height, 35 feet; girth of stem, 6 feet 6 inches; spread of branches, 40 feet. *Q. sessiliflora*, 60—65 feet; girth, 7 feet 6 inches. *Q. ilex* var. *latifolia*, 38 feet; spread, 55 feet. *Acer Negundo*, 40 feet; girth, at 4 feet, 6 feet 9 inches; spread, 66 feet. *A. monspessulanum*, 30 feet; girth, 5 feet; spread, 45 feet. *Cedrus Libani*, 50 feet; girth, 5 feet 6 inches; spread, 40 feet. *C. atlantica*, 32 feet; girth, 4 feet. *Pinus Pallasiana*, 60 feet. *Ulmus campestris*, 85 feet; girth, 9 feet. *Pavia flava*, 45 feet; girth, 5½ feet. *Ed.*]

## ORCHID NOTES AND GLEANINGS.

### LÆLIA AUTUMNALIS.

A REMARKABLE and very handsome monster of *Lælia autumnalis* has been sent me by Mr. John Cowan, manager of the Liverpool Horticultural Co., Garston, near Liverpool, to report upon, with the information that the flower is the only one produced by the plant, which is an imported one, now flowering for the first time in this country. Its peculiarity consists in the fact that the dorsal sepal is wholly united with the back of the column, for the whole length of the latter, and in a very singular manner too; while the lip and remaining segments are quite normally developed. The column is of the usual size, and the anther quite perfect, but there is a dorsal keel-like growth throughout its length, to which the sepal is attached along the central line. The sepal itself is also very peculiar. It can best be described by saying that there is a second super-

numerary sepal, three-fourths as long as the ordinary one, and correspondingly narrower, in front of the ordinary sepal: and, like the column, only adnate to it along its central line. It extends beyond the column half-way to the apex of the ordinary sepal, in this part its margin being quite straight, but from the apex of the column downwards the margin on either side is strongly and regularly crispo-undulate, into about seven folds, like a goffered frill, as it would be termed in the laundry. This supernumerary growth, which is coloured like the sepal, is doubtless analogous to the corona of *Narcissus*. It is probably a case of accidental union of organs, rather than a permanent one.

### CATASETUM TABULARE (*Lindl.*) VAR. *SERRULATA*, Rehb. f.

A flower of this remarkable *Catasetum* has been forwarded to me by Messrs. James Veitch & Sons, of Chelsea, for identification; and proves to be the above-named, of which a figure may be found at t. 1223 of the *Gartenflora*. The expanse of flower is over 2½ inches, the narrow sepals very pallid green, the petals broader, and densely punctulate, with pale purple-brown on a pale green ground. The lip is a highly remarkably organ, in colour somewhat like the petals but paler; with a conical spur underneath, and a very large fleshy crest on the front and centre, to which the name *tabulare* applies. In this variety the margin of the lip is serrulate, and the crest smooth and of a light cream colour; while in the type the same organ is more rugose and hairy, and the whole flower of a darker colour. The arrangements for effecting fertilization are, in the male (for the female is, I believe, at present unknown) exceedingly remarkable. The great table-like crest serves as a landing-stage for the insect; one antenna is curved round at the base of the column, and doubtless functionless as in several others with a similar arrangement; while the other stands forward in the mouth of the spur, ready at the moment that the insect tries to push its head inside, to convey the stimulus to the anther, and precipitate the pollinium on to the shoulders of the insects. Will none of our great importers look out for the females of this singular genus?

### LÆLIA CRAWSHAYANA, Rehb. f.

This beautiful plant was described as probably a natural hybrid between *L. albidia* and *L. anceps* or *L. autumnalis*. Some time ago I received a flower said to be an authentic one, on which point I am quite satisfied; and I then thought its hybrid character probable, the plant having the general appearance of *L. albidia*, with the colour of *L. autumnalis*, though I could not find the slightest trace of *L. anceps* blood in it. I have now received a three-flowered peduncle from Baron Schroder, The Dell, Egham, Surrey, through Messrs. Veitch & Sons, of Chelsea, and I am inclined to think it is only a most beautiful rose-coloured form of *L. albidia*. The shape of the segments and lip, and even the yellow crest, appear quite identical, while the approach to *L. autumnalis* is in colour only. Other rose-coloured forms of *L. albidia* are known. *R. A. Rolfe*.

### MAXILLARIA GRANDIFLORA.

Numerous as the species of *Maxillaria* are, very few of them find a place in collections outside botanic gardens. There are, however, some eight or nine which will well repay cultivation, and of these, with the exception of *M. Sanderiana*, the above is probably the best. It very much resembles *M. venusta* both in habit and shape of flower, but it is superior to that species in not developing its flowers face downwards, so that they cannot be properly seen unless lifted up. The flat, two-edged pseudobulbs bear single, leathery, dark green leaves, 12 to 14 inches long. The flowers are produced singly on erect scapes 6 inches long, and measures 3½ inches long, and measure 3½ inches in diameter. The sepals and petals are pure white, and firm in texture, the latter being smaller than the sepal, and recurved. The side-lobes of the lip are erect, and rosy-purple, the triangular front lobe being of a

beautiful soft yellow. Like the flowers of many other *Maxillarias*, these give off a pleasant fragrance. Coming from the Andes of Paraguay and Peru, this species require a cool, moist atmosphere, and should be grown in pots in a compost of peat and sphagnum. It is flowering now at Kew. *W. B.*

#### DENDROBIUM PRIMULINUM.

A lovely variety of this *Dendrobe* is now flowering most profusely, having ninety-seven flowers on nine growths, in Mrs. Arbutnot's collection, Bexley (gardener, Mr. Mitchell). It is growing in a 32-sized pot, with a little peat and moss, and it looks remarkably chaste when hanging beside the *Sophrontitis grandiflora*. *John Carvill*.

#### PHALENOPSIS INTERMEDIA PORTER.

In the fine gardens of Mrs. Perrin, Davenham, Malvern, under the care of Mr. A. Bradshaw, a noble specimen of this rare white and rose species bears a five-branched spike of fifty-nine flowers. Each flower is over 2 inches in width, and excellent culture has made the rosy-crimson front lobe of the labellum, and the spotting on the side lobes very bright and showy. A branched spike of *P. amabilis*, 3 feet in length, has twenty-seven flowers, and others are good, a large-flowered rose variety of *P. Esmeralda*, with forty-seven flowers, being especially attractive.

#### CATTLEYA EXONIENSIS X.

A noble specimen of this handsome and fragrant production of Messrs. Jas. Veitch & Sons, is in flower in Mrs. Perrin's gardens, at Davenham, Malvern, with fourteen flowers. It is the best variety, with very rich crimson and yellow in the labellum, and petals also keep flatly expanded. It is a fine and valuable specimen, and it and the other *Orchids* here has been skilfully managed by Mr. Bradshaw.

#### MINIATURE ORCHIDS.

The object of the present note is to point out a few of the smaller *Orchids*, some of which rarely find a place in collections, but which, requiring little space and attention, are nevertheless objects both of interest and beauty. Many plant-houses might not only serve their present purposes, but also afford room for most of these little gems, and thus greatly add to their attractions. Two yards of copper wire strung about 9 inches from the roof-glass would hold a dozen or twenty of them, and after the plants were obtained, a few shallow pans made for suspending, and some peat fibre and sphagnum, would complete the outfit.

Amongst cool *Orchids* there are several remarkable little *Masdevallias*, *M. triaristella* and *M. trichata* are easily grown and free-flowering; *M. muscosa* has the almost unique power of jerking up the column at the slightest touch. The genus *Pleurothallis* has not an enviable reputation amongst *Orchid* growers but some of its smallest representatives are very pretty. *P. macroblepharis* and *P. Barberiana* are similar in general appearance, but are quite distinct; they have transparent whitish flowers thickly and beautifully spotted with purple, the latter is scarcely ever out of flower. *P. ornata* is a minute species, with leaves half an inch across and purple flowers, the sepals of which are furnished at the edges with numerous club-shaped appendages that twirl about at the slightest breath of air. *Sophrontitis grandiflora* is a well-known species, with bright scarlet flowers; *S. violacea* is equally beautiful, but is seldom grown. It has purplish-violet flowers, and blooms in February (t. 6880, *Bot. Mag.*). *Sarcocochilus Hartmanni* is an Australian species, well worth cultivating for its dense spikes of white flowers, which are produced in spring, and last a long time in beauty. *Odontoglossum* has a charming representative in *O. Crstedii*, whose white flowers are delightfully fragrant.

In a little higher temperature might be grown *Laelia pumila*, with its beautiful rosy-crimson flowers, and *L. monophylla*, a species found on the mountains of Jamaica; it has slender stems, 5 or 6 inches

high, bearing solitary, bright scarlet flowers, and differs from other *Laelias* in requiring a shady position in summer. *Mystacidium filicorne* is a Cape *Orchid*, a good idea of whose beauty is given in a figure in the *Gardeners' Chronicle* for July 30, 1887; its flowers are white and fragrant. *Angraecum falcatum* does well in an intermediate-house grown in sphagnum alone; its white, scented flowers and long slender spur are always admired. *Promenaea citrina* has rich yellow flowers, the lip being spotted with crimson; *P. stapelioides* has peculiar looking greenish-yellow flowers, thickly marked with blackish-purple.

In the warm house might be grown various species of *Bolbophyllum* whose hinged labellums are very interesting; the small but lovely *Angraecum* from Madagascar, *Dendrobium Jenkinsii*, and many others. Indeed, the list I have given might easily be trebled. *W. B.*

### DRIED FRUITS.

THE winter season brings round an increased trade in dried fruits, which take the place to a large extent of fresh fruits. Raisins, Currants, Figs, and Dates, appear in quantities in the grocers' shops. The preparation and commerce in these give employment to thousands of people in various countries. The dried species of *Prunus* of themselves furnish an extensive trade on the Continent, on which we are dependent for our supplies.

The common Plum, or Prune, is grown in great abundance about Bordeaux. One firm alone exports this article to the value of about £13,000. The dried Plums are the "Pruneau or Prunes sèches" of the French. The best are the large black ones received from Bordeaux. Prunelloses, or Prunes du Brignolles, are received from the neighbourhood of Brignolles (Var), whence their name. They are somewhat larger than the common Prune. Of French Plums and Prunelloses we received 14,388 cwt. in 1885, valued at £51,474, nearly all from France; all of these but 2000 cwt. were taken for consumption here. The duty on all saccharine preserved fruits is 7s. per cwt. Of Prunes we received in the same year 27,504 cwt., valued at £32,122. All but 3000 cwt. came from France, and were for home consumption.

To give an idea of the commerce in fruit in the department of the Gironde, it may be stated that a single confectioner in Bordeaux has been known to purchase as many as 4000 lb. of Reine Claude (Green Gages) every day for a fortnight, besides large quantities of Peaches and Pears; and he has expended as much as £800 in the purchase of Apricots. There is also a species of wild Prune which grows about Labresne and Bouillac which is very prolific. It ripens in the month of July, and as many as 2000 baskets may be gathered in a day.

The preparation of Prunes is a largely developed industry in the central and southern departments of France. At Agen and Tours they collect the fruit as it ripens and falls to the ground. They are then exposed on trays to the sun, after which they are passed successively through an oven three times at different heats. In Provence after the Prunes are collected they are plunged into boiling water, drained, and then dried in the sun.

The Prunelloses are first peeled and then placed in thin bags, wrapped round with straw, and dried in the sun till the principal part of the moisture has evaporated. As Prunes contain much sugar this forms, on those of good quality, an efflorescence on the surface. The best Prunes come from Nancy, Tours, Brignolles, and Agen.

Dried or preserved Plums reached us in 1885 to the amount of 7048 cwt., of the value of £11,146, and they were nearly all consumed in this country. The bulk of these supplies came from Germany and Austria, France and Portugal supplying the remainder.

The Plum crop is the most important of the province of Bosnia, and is chiefly gathered in the north.

The annual produce is about 120,000 cwt., of which half is available for export. They realise on an average £1 per cwt.

There is a preserving factory in Slavonia which turns out annually 240,000 boxes of preserved fruits. Slavonia produces annually about 30 tons of dried fruit and 2000 tons of "compotes" of Prunes, which are found on almost every dinner-table in Germany. From the Plum they also distil a kind of "brandy," called "Slivovica," or "Slibowitz," and make large quantities of sweetmeats. Hungary carries on an extensive trade in dried fruits. *P. L. S.*

### CULTURAL MEMORANDA.

#### EURYCLES AUSTRALASICA.

In habit this plant resembles *Eucharis amazonica*, except that the leaves are broader, shorter, rounder, and more deeply channelled. It produces large heads of beautiful white flowers borne on stout stalks. Propagation is by offsets, which should be potted into 3-inch pots, in a mixture of four parts sound loam to one of leaf-soil and sharp sand. Place the plants in a stove, or warm pit near to the glass, to prevent them making a weakly growth, affording water at the roots. After the latter have pushed into the soil, warm liquid manure should be afforded them, alternating it with clear tepid water. *H. W. Ward*. [There are two species in gardens, viz., *amboinensis*, with white flowers on a many-flowered umbel: season of flowering, March: *Australasia* is its synonym; and *Cunninghami*, the Brisbane Lily, also with white flowers, which are less crowded than those of *amboinensis*. *Ed.*]

#### DIELYTRA SPECTABILIS.

The gracefulness of this plant and its delicate rose-coloured flowers render it a very effective plant for the conservatory or for cutting; when, as in the latter case, it is mixed with its own beautiful leaves, it is very beautiful. Plants which were transplanted in the open during the last or the previous spring are those best adapted for the purpose of being forced. The stools should be taken up if they are still in the border and potted, using ordinary mould and pots no larger than are required to hold the roots without injury, leaving the crowns a little above the surface. Place the potted roots in a Peach-house or vinery or any house in which the temperature is about 50°. Settle the soil by giving the pots a good watering, afterwards covering each crown with an inverted flower-pot until they have made 9 or 10 inches of growth, and the flower-spikes have got well above the foliage. The inverted pots must then be removed by degrees, and tepid liquid manure occasionally given to assist development. When the plants have done flowering they should be hardened off before being again planted in the open ground in spring. *H. W. W.*

#### ANTIGONON LEPTOPUS.

At first sight the flower of this plant might readily be mistaken for those of a small species of *Bougainvillea*; but on closer inspection it can be easily seen that, instead of the coloured flower-bracts being the most showy part, as in *Bougainvillea*, it is the usual floral envelope—a perianth of five pieces—which is the showy part in this plant, the three outer petals being larger than the two inner. They are all a bright rose colour, the individual flowers being about half-an-inch across. They are produced on axillary and terminal one-sided racemes, which run out into slender, branched, hooked tendrils; and as is often the case in plants belonging to this order, the commencement of the inflorescence soon marks the point on the shoots where leaf-growth ceases, so that the end of the shoots for a foot or more is entirely made up of flowering branchlets which are disposed in a graceful manner. The plant is said to be indigenous to Mexico, but we are told that it is now widely distributed in tropical countries. The plant was introduced to England some twenty years ago, but it is not nearly

so often met with as might be expected. It is a plant easily grown, and is well adapted for training up a rafter or similar position in the stove. To grow it freely it should be planted out in the usual way in well drained rich soil, in a sunny position. A specimen is now flowering freely in the aquatic-house here, which is planted out in the ordinary way, behind the hot-water pipes, and trained on strings along the roof. During the time of growth the growing points should be trained a little to prevent confusion; but as the flowering period approaches the points should be allowed to hang down for the sake of a better effect. Care must be taken not to injure the points of the shoots when the plant is growing early in the year. After flowering it should be pruned. *F. Ross, Pendell Court.*

#### MONSTERA DELICIOSA.

The large dark green leaves of this plant are rendered very attractive by the way in which they are perforated, and many curious remarks are made by those who see them for the first time. In looking at these perforations one naturally wants to know of what advantage or use they are to the plant? Can it be for the purpose of allowing light to pass through on to the leaf or leaves below? The spathes are very conspicuous; in colour they are of a creamy whiteness, shaped like a boat with the spadix passing up the centre; a spathe we measured a short while ago was from 11 to 12 inches in length and 8 inches in diameter. The fruit, when ripe, gives off an agreeable odour, and its flavour would be very good were it not for the raphides, which are very abundant in the fruit (also the leaves), and these leave a painful stinging sensation in the mouth, especially when one eats without knowing the consequence. It flowers and fruits in a temperature which does not fall lower than 45° in winter. It requires to be grown on a wall, or can be made to cover the stumps or stems of old trees; and these, if covered with the small creeping kinds of Ficus, give it a much more ornamental effect. Wherever planted the places should be syringed occasionally until the plants become attached. *W. H.*

#### PLANTS IN FLOWER AT KEW.

*ALPINIA MUTICA*.—Apparently this species flowers more freely than the older *A. nutans*, which it resembles in foliage, size, and habit, but differs in having an erect instead of nodding raceme of flowers. The first-mentioned was introduced from Borneo, by Mr. Bull, in 1882. The Kew specimen is a large one, having many stems, 8 feet high, leafy to the base and evergreen. The racemes attain a length of 8 inches, and bear about a score of flowers, which open in pairs; the calyx is half an inch long, tubular, and toothed; the corolla is composed of three oblong petals, 1½ inch long, and a fourth one, large, and lip-like, folded like the labellum of a Phaius, and coloured yellow, with numerous spots and lines of crimson. The flowers, as well as the leaves, exhale a strong, aromatic odour. These strong growing Alpines are first-rate plants for large, moist stoves, or aquaria.

*Phaleria laurifolia* is a robust Laurel-like stove shrub, which was introduced from Ceylon many years ago. The genus is related to Daphne, the flowers being very similar to those of *D. indica*, but pure white. They are produced in terminal heads on the principal branches, remaining fresh a long while. Like the flowers of Daphne too, they are also deliciously fragrant. The leaves are lanceolate, 5 inches long, and shining green. The Kew plant now flowering is in the Palm-house; it is about a yard high. Although not so good a plant as Daphne indica, yet this Phaleria is worth growing in good collections. It is figured in the *Botanical Magazine*, t. 5787.

*Greyia Sutherlandii*.—The Kew plant is flowering exceptionally early this season, and it has been exceptional also in not losing its leaves as usual in the autumn. It is a shrub 7 feet high, freely branched,

with shining green kidney-shaped leaves and terminal racemes of crimson flowers, like those of Melianthus. The genus is monotypic, and is a native of Natal, where it flowers in February, and makes a brilliant display, but it does not flower freely nor regularly in England.

*Agave dasyliroides*.—This is one of the handsomest and most distinct of Agaves, considered as greenhouse plants. It is more like a Yucca than such species as *A. americana*, the leaves being 3 feet long, 1 inch broad, rigid, with a long pungent tip, and very glaucous, almost silvery in colour. A healthy, full-sized plant bears about eighty leaves, and is 3 feet high. The spike is 8 feet long, arching, almost drooping, so that if not supported it would trail on the ground. The flowers are very numerous. tubular, 1 inch long and half as broad, greenish-yellow; they expand in whorls from the base onwards. This species is allied to *A. striata*, and is sometimes cultivated under the name of *A. dealbata*. It is figured in the *Botanical Magazine*, t. 5716.

*Aloe ciliaris*.—Many species of Aloe are in flower or bud just now, but the most distinct and noteworthy is that here named, which deserves to be a popular garden plant. It has thin scandent stems, scarcely half an inch in diameter, branching freely, the upper foot or so clothed with lance-shaped leaves 5 inches long, 1 inch broad at the base, gradually narrowing upwards; the margins are clothed with small soft teeth, those at the base being white and almost hair-like. The flowers are developed near the top of the leafy shoots, each raceme being 10 inches long, the upper half bearing many tubular flowers 1 inch long, yellow and pink, pale green at the mouth. These flowers are quite as beautiful as the best of Lachenalias, for which they might easily be mistaken; they also remain fresh a long time when cut and placed in water.

*Lachenalia pendula*.—The first species to bloom this winter, and also one of the handsomest. A group of plants in the Cape-house is a pretty picture in brown-purple and yellow. This has much larger flowers than any of the others, and it is easily grown. The genus might be turned to good account by hybridists; certainly there are both variety and elegance as well as bright colours sufficient to work upon.

*Freesias*.—A large, well-flowered group of these delightful Cape bulbous plants in the conservatory here, prove their value, if proof be needed, as winter-flowering greenhouse plants. Nothing could be prettier, and certainly nothing is more pleasantly scented than the flowers, and they last a long while. It has already been stated in the *Gardeners' Chronicle* that the best treatment for Freesias is not to rest them, but keep them growing on all summer, shifting them into larger pots if necessary, but without disturbing the old ball of soil. Some of the Kew plants were treated in this way, and they are much finer than those which were rested. After what we were told by Professor McOwan in regard to the natural conditions of Freesias, it is extraordinary that the no-rest treatment has been more successful than the usual dry-rest treatment for Cape bulbs in general. The large, white-flowered form known as *F. refracta* alba, has proved by far the best garden plant. *W.*

#### STAPELIA GIGANTEA.

WHEN I described this grand species in the *Gardeners' Chronicle* for 1877, vol. vii., p. 684 and p. 693, f. 112, it had not then flowered in this country to my knowledge, nor does it appear to have done so since until the present season, when, to my gratification, it flowered last month in the garden of Sir George Macleay, at Pendell Court, and has been drawn for the *Botanical Magazine*. The flower was not as large as that represented in the figure, which is here repeated (fig. 101), but measured about 11 inches in diameter when the lobes are fully spread out. The colour of the flower is pale yellow, marked with pale reddish transverse lines, and thinly covered with erect pale purple hairs, which are scarcely visible, except when the flower is seen sideways. The bars represented on the underside of the petals in the engraving should have been omitted. The odour is disagreeable, as in the other species of the genus, although I have been told of one that is sweet scented—about which I should like to have substantial evidence, as all the species I have seen living, belonging to all the genera of the tribe Stapelieae, have been either disagreeably scented or odourless. Although *S. gigantea* was originally discovered in Zululand by Mr. Plant, and introduced into Europe by Mr. Cooper from the Botanic Garden, at Durban, Natal, it has since been found in Namaqualand, which is quite on the other side of the continent—an interesting fact in the geographical distribution of these plants, which are usually local, and, so far as I can learn, do not exist in any great numbers in any one locality. *N. E. Brown, Herbarium, Kew.*

#### V I O L A S .

THE correspondence in your columns is most seasonable. It is now that people are making up their minds as to what they will have for spring and early summer flowers next year. No doubt in the South, Violas must bloom in April, May, and the first week or two in June, to be of any use. After that, in an ordinary year, their season is practically over in all the southern counties. We would advise planting early in March, if plants are sufficiently rooted and the weather favourable. In Scotland, it is difficult to get plants sufficiently well-rooted so early as that, and it is always difficult for Scotch nurserymen to execute orders for Pansies and Violas as early as growers in the South of England would like, unless they have batches of plants struck in August.

In selecting a piece of ground to grow Violas, it ought to be remembered that they cannot endure the full blaze of the noonday sun. Choose, therefore, a slightly shaded position, a border facing west or east rather than due south, is preferable. We do not mean to say Violas will not grow facing south; the fact is, many of the most useful varieties will grow almost anywhere; but we are advising planting where the best all-round results are likely to be obtained. In a border slightly shaded from the noonday sun in July, plants after flowering, will grow well and make clumps for the following year, from which it will be possible to gather flowers, literally in baskets.

Regarding manure, we would recommend that old well-decomposed cow manure be dug into the ground now, and that it be left in a rough state until planting time. We quite approve of autumn planting in the South, but it is too late now to attempt this, and it will be much better to defer until March.

FIG. 101.—*STAPELIA GIGANTEA*: PALE YELLOW, WITH REDDISH LINES. (SEE P. 728.)

From the catalogue of any nurseryman who makes a speciality of *Violas*, the names of the best varieties can easily be gleaned. There are a few we might mention which ought to be in every collection however small. They are fine free growers, and are beautiful either as bedders or as cut flowers for glasses. These are—Countess of Kintore, bluish-purple and white; Countess of Hopetoun, pure white; Archibald Grant, dark rosy-purple; Bullion, bright golden-yellow; Skylark (or its improved form, Blue Cloud), white, with a band of blue on top petals; Columbine, white, margined with rosy-lilac.

Now there are half-a-dozen sorts which will do well in the hands of either amateur or professional. Of course we could enumerate many more—some, perhaps, prettier, if we went into the new class, which should, strictly speaking, be termed "fancy *Violas*;" but we could not name more useful varieties.

As to exhibiting them, they could either be shown grown in pots or pans, as suggested by Mr. E. Jenkins, or in sprays for cut blooms, or in glasses mixed with *Adiantum* fronds. We conceive that were this properly done, and brought under the notice of the public at the London shows, *Violas* would at once spring into the front rank as flowers suitable for glasses, and for table and other decorations. *Dobbie & Co., Rothsay.*

## THE BULB GARDEN.

### AUTUMN AND WINTER FLOWERING CROCUS.

DURING November and the early days of December the garden has been gay with *Primroses*, *Polyanthuses* and *Auriculas*, even the laced *Polyanthuses* are in bloom, George IV. being very fine, the flowers of large size and markings good. Many species of *Crocus* have perfect flowers, which in ordinary seasons are crippled by frost. The best amongst them has been *C. longiflorus*, not alone for its lovely lilac colour, veined with purple, but for the number of flowers it has produced. Its corms increase quite as freely as those of the common *C. vernus*, so that there is no wonder that it is common where it grows wild, in Southern Italy, Sicily, and Malta. It has many synonyms, and is described by Herbert under the name of *C. odoratus* var. *longiflorus*, and figured in *Bot. Reg.*, 1844, vol. xxx., t. 3, fig. 5, as *C. odoratus* var. *melitensis*. This is beautifully figured and described by Herbert.

*C. Boryanus* was opening its flowers slowly on December 10, when the wind changed and frost checked their further development. This species seldom flowers well out-of-doors, owing to its blooming at mid-winter. The flowers are very pretty, white, with a rich purple stripe externally. Mr. Maw figures the normal form, with pure white flowers, and remarks that "an occasional variety is sometimes found with delicate lilac featherings on the outer surface of the outer segments." The plant is dwarf, and not of robust habit. Mr. Maw retains the name of *C. Boryi* (Gay), for this species, and rejects Herbert's name of *C. Boryanus*. *C. lavigatus* has been in flower for a long period; it is a very pretty species, and one of the best for gardens.

We have also in flower the variety *striatus*; the flowers are of a blue-lilac colour, the outer surface of the segments striped purple. The leaves come with or before the flowers. Mr. Maw says it flowers from the end of September to Christmas, and often into the spring. *C. ancyrensis* is now in flower, and is a pretty little thing with prettily formed golden-yellow flowers, very distinct from any other variety, but feeble in growth, and so we grow it under glass. Mr. Maw gives the above as its specific name, while Herbert describes it as a variety of *C. reticulatus* and Baker as a variety of *C. susianus*. *C. asturicus*, though an October flowering species, retained its flowers until December. It reminds one of *C. nudiflorus*, but it is variable in its colouring.

We had also in flower a very pretty free-growing species on the first days of December, under the

name of *C. Tournefortii splendens*. The species *C. Tournefortii*, of Gay, has been described under many different names, and the work of Mr. Maw, in investigating this interesting genus of plants, and bringing those that are not of specific rank under their true names, must have been laborious, had it not been a labour of love. This species has been figured in *Bot. Mag.*, t. 5776, as *C. Orphanides*. It had been sent from Greece to Kew by Professor Orphanides, of Athens, under the name of *C. pholegandrus*, and the new name was given by Hooker. It is figured in *Bot. Reg.* for the year 1845, t. 37, from a drawing by Herbert; but his delineation is not so happy as usual.

*C. Clusii* is one of our most valued species, and its purplish flowers are very pretty. It flowers with us in December. Mr. Maw gives three figures of it, one marked October 3, another November, and a third December 10.

I think these autumn and winter-flowering *Crocuses* are the most lovely of the season in which they are produced; and one cannot wonder at the enthusiasm of such ardent cultivators as Mr. Maw and the late Rev. Harpur-Crewe, leading them to devote so much of their time to study the life-history of the plant. The *Crocus* was also a favourite flower of Dean Herbert, and his papers on the genus *Crocus* in the second volume of the *Journal of the Royal Horticultural Society* give evidence of laborious research. The plants can be cultivated in pots, and in that state can be moved anywhere when in flower. *J. Douglas.*

## FORESTRY.

MARKETING HOME-GROWN TIMBER.—As we have just entered upon the season when the bulk of home-grown wood is placed upon the market, a word or two with regard to it and supplementary to my remarks a few weeks ago upon selecting and marking, may be acceptable. The subject is broadly divided into two heads, viz., auction sales and sales by private contract, as the semi-private plan of offering by tender really comes under the latter heading.

Auctions.—The obvious advantage of selling in this way is the publicity obtained and the competition generally induced. The set-off against this advantage is, of course, the one considerable expense which a public sale entails. The desirability of this plan of disposal certainly depends much upon surrounding circumstances, and no hard and fast rule can be laid down; but speaking from experience I should say that private bargains, when they can be made, are generally satisfactory. Beyond the mere question of expense, another great drawback to auction sales, especially when divided into small lots, is the number of different purchasers who, by buying a lot or two, obtain access to a place. Some I know look upon this as a gain, on the ground that the timber is more readily cleared. This, so far as it goes, may be true, but it is far more easy to control the operations of one or two respectable merchants than of a whole host of small traders. This is much more important than the saving of a few weeks in clearing, as large buyers are almost always ready to meet the wishes of sellers in moving what is most in the way and at the proper seasons. Where there are game preserves, for instance, it is very convenient to arrange matters in this way.

When, however, an auction is decided on, care should be taken that the conditions of sale are carefully framed, as by this precaution the evil of the variety of customers, may, to some extent, be minimised. These conditions will, of course, vary according to the necessities of the case, and whether the timber is standing or felled. I will take, for example two different estates, in which the sales are treated in different ways. In both cases the trees are standing, but in the first the vendor reserves to himself the felling, the purchaser having the option of sending a man to look after his interest if he desires it. In the other, the more general plan of allowing the purchaser to bear the expense is followed. The conditions stated are, that in the hedgerows the trees

may be sawn off, and the stools left, but the purchaser has to replace any earth removed, and make good the fences. All trees standing in the open fields or park lands to be rooted up.

In the case of the hedgerows, it would no doubt be better if the roots were out of the way, and the banks made good and replanted. The cost of this, however, is relatively very heavy, and if insisted upon would make a corresponding loss on the proceeds of the sale. On the whole it is wise, unless in special cases, to allow the purchasers the option of sawing off all trees which are not actually in the open.

*Private Treaty Sales.*—As I have pointed out above, this is the way of selling I most favour. There are, of course, many persons who think otherwise, and argue that when competition is done away with sellers do not get a full price. This objection really amounts to but little, as buyers are perfectly aware that it is easy to have an auction if the seller so elects. The real reason of the majority of auctions is the lack of knowledge on the part of the seller and his agent of what the particular lot they have to offer is worth. It is not surprising that they should be in doubt, as their practice is so small. A much cheaper plan, however, than an auction would be to secure the services of a capable valuer who would fix upon a price. The merchant could then either accept or refuse. It would not be often that business did not result.

*Selling when Felled.*—I have hitherto dwelt entirely upon selling standing, and this is becoming more and more common. In felling before selling, the owner is at the mercy of the market, as the timber must be disposed of in some way within a limited time. The exact contents of a felled tree can of course be more easily found than the contents of a standing one, but the difference is not at all in proportion to the extra trouble and cost. *D. J. Yeo, Lyneham, Wilts.*

## PLANTS AND THEIR CULTURE.

*JUSTITIA SPECIOSA*.—The bright carmine-coloured flowers of this plant, although not thought much of when cut, are in the winter of much decorative value. Any plants which were grown in cool frames in summer, and will now be in an intermediate-house, will be showing the colour of their flowers in the order in which they were last stopped. When wanted at an early date a little more warmth will bring them on, and it will be found that the flowers and foliage will be improved by weak liquid manure afforded the plants at regular intervals. Fumigate slightly if greenfly appears, or syringe with weak tobacco solution. After they have flowered, unless kept for some little time and partially rested, it is better to throw them away, young plants being easily raised. When old plants can be accommodated they will, when reintroduced into heat at a later period, flower again freely. Of course, if desired the plant may be rapidly grown into a large specimen, but large specimens are not generally so serviceable as small ones. The late struck plants should be repotted as soon as they require it; for if deferred too long the bottom leaves drop off. Any light rich soil suits the plant, and while growing keep the plants near the glass.

*Lachenalia*s and other bulbous plants should now be growing where they may get all the light and sunshine possible. These and other small growers do very well in the greenhouse on shelves near the roof. *Cyrtanthus* enjoys a few degrees more warmth than others, and as the plants are small, they would be likely to suffer if placed amongst stronger growers. Even such large bulbs as those of *Albuca*, *Ornithogalum*, *Glaucidium*, *Crinum* Moorei, *Brunsvigia*, soon get into bad health when crowded or shaded by other plants. Be careful not to over-water any bulbous species not in vigorous growth.

*Cinerarias*.—Those showing flower should be carefully examined for aphides, and if any traces be found, slight fumigation must be done at once. The best practice is to fumigate for two or three nights in succession, and see that the foliage is dry. On the morning after the last fumigation, if the

plant be moderately syringed, it will still further clean them, and help them to overcome the ill-effects of the smoking. Succession plants should be kept steadily growing, and to prevent "drawing," afford the house or pit plenty of air whenever practicable, guarding against admitting frosty air. These plants will not suffer so long as the temperature does not drop below freezing, but 40° should be the minimum. A close warm atmosphere is always injurious, and speedily ruins the prospect of good bloom on Cinerarias. The latest seedlings will now be fit to pot off, and probably into their flowering pots. Use, as before recommended, a rich loamy soil, with a small quantity of bone-dust or fish guano. Stand the plants on a moist surface, but do not regularly syringe them.

*Herbaceous Calceolarias* require a similar course of treatment, but the potting soil used may be of a much heavier nature. One of the best places in which to winter the *Calceolarias* is a light span-roofed frame with a floor of coal ashes, and sufficient hot-water pipe to keep out the lowest degree of frost we may have. *F. Ross, Pendell Court, Blitchingley.*

## THE FLOWER GARDEN.

**TREES AND SHRUBS.**—Push forward all planting operations when the soil is in a suitable condition. Mutch newly-planted stuff, and stake all such as need it. In gardens where the planting operations have already been brought to a close it will be advisable to make a thorough inspection of the established plants, noting those that are not flourishing, and adopting measures to meet each case. Large unhealthy specimens must have the surface soil taken away down to the roots, and without injury to any of the latter; and replace it with good sound loam and leaf-mould, mixed with some of the staple, adding thereto peat for such as need it. A mulching of manure is in all cases of sickly trees, &c., of great benefit. In the event of hard weather, get in readiness for next season, shreds, labels, and stakes. Give attention after frost to all autumn-planted perennials in beds and borders, and let the soil be pressed down firmly with the hands about the spring bedders.

**Indoors.**—Zonal *Palargoniums* and kindred subjects which do not require a high temperature, should be watered sparingly at this time of the year, and top ventilation afforded on all favourable occasions to prevent loss from damping. If wintered in light airy houses, and stood on shelves comparatively near to the glass, such plants will give little trouble. Keep the soil in the pots stirred and the plants clean.

*Alternantheras*, *Colens*, and *Iresenes* will require closely looking after for some little time to come, and ought to be in a temperature of not less than 60°. *Verbenas* and other small plants liable to get attacked by aphides should be fumigated with tobacco paper occasionally, to keep them clean. Examine tuberous *Begonias*, *Dahalias*, *Gladioli*, and *Cannas*, and let none suffer from extremes of damp or dryness, and for some few weeks to come keep them in a dark and cool place where they will be secure from frost. *J. Horsfield, Heytesbury.*

## FRUITS UNDER GLASS.

**PLUMS AND CHERRIES.**—These must be kept cool, and the house well ventilated if they are under cover. If attention to pinching was given during growth there will be little pruning now necessary beyond trimming rough cuts. Get the trees cleaned as a safeguard against insect enemies, and top-dress the balls with loam, bone-dust, and lime rubbish. Prior to resurfacing, remove all the soil as far as it is safe, and ram in the fresh material. Give every attention to watering, but guard against excess, and do not let the night temperature exceed 50°. The forcing of *Plums* and *Cherries*, if it can be so called, must be carried out with the utmost caution, else the crop may be suddenly and entirely lost.

**Melons.**—A large heap of leaves and stable litter should now be in a proper state of fermentation, and ready to form into the bed for the earliest *Melons*. If composed largely of leaves, so much the better, as the heat will be steady and lasting. Let the *Melou*-house be thoroughly cleaned, and every surface well coated with hot lime-wash, into which a handful of flowers of sulphur has been stirred. When the fer-

menting material is brought in let it be trodden quite firmly, so as to prevent much immediate subsidence, as well as to equalise and prolong its warmth. On the top, place a few turves grassy side downwards, and at intervals of 2 feet construct little mounds of loam, leaf-mould, and old Mushroom-bed manure; into each of these drop two or three seeds—*Penny-rhyn Seedling* and *Best of All* will be found reliable varieties. Let the night temperature be kept at 65°–70°, being ruled in this matter by the prevailing weather. Allow a rise of 75°–80° by day.

**Cucumbers.**—Guard against overcropping, and keep an outlook for thrips and aphides. Allow the plants to grow freely, so as to induce root action; attend to top-dressing with loam, leaf-mould, and spent Mushroom-bed manure, at the same temperature as that of the house. Whenever the roots appear on the surface, keep the night temperature at 65° on cold nights, and 70° on mild ones, but when cold winds and frosts prevail, have recourse to covering the glass with *Frigit Domo* or mats. During dull days raise the temperature to 75° by fire-heat, and during steady sunshine at 85° with air. Admit a little daily when the weather permits its being done safely. Where there is no *Cucumber* pit no time should be lost in getting a hot-bed made, if this be not already done. It will require to be about 6 feet high, and 4 feet wider than the box, to produce the requisite temperature. When the heat subsides to 90° the seeds may be placed in a little mound in the centre of each light. Some loose litter in as dry a state as possible shaken around the bed will prevent the escape of heat. The glass will require covering up with mats, and in very hard weather, with litter as well under the mats to secure a temperature of 70° to 75°; a trifle of ventilation must be afforded day and night.

**Strawberries.**—The *Strawberry* plants recommended to be placed on a bed of leaves last month, will have made a start to grow, and when the flower-spikes are discernible remove the plants to a shelf close to the glass and afford them a temperature of 50°–55°. Do not exceed the latter figure until the plants are out of bloom and the fruit set. Keep the roots in a moist state, but not wet. Introduce successions from the open ground every fortnight. In the absence of pit accommodation, the shelves at the top of *Peach*-houses may be made use of for the plants. Examine each pot, to ascertain the state of the drainage, and to see if worms are in the soil, pick off decayed leaves and scrub the pots clean. Where the plants are started in houses, wire shelves are the best, as every facility is thereby afforded for syringing; this is important, as the slightest check soon causes red-spider to put in appearance. Aphides must also be destroyed by fumigation before the blossoms open. *W. M. Baillie, Luton Hoo.*

## THE HARDY FRUIT GARDEN.

**CHERRIES.**—The pruning of all *Cherry* trees should now be done, the trees on walls being nailed or tied soon afterwards. The pruning of dessert *Cherries* should always be done as far as possible in the summer, as the tree free of the pruning-knife in winter is conducive to gumming. Summer-pruned trees will now only require to have the spurs shortened back to two buds. Young trees will require their branches to be thinned and regulated, and in *Bigarreaus* a space of 8 or 9 inches should be left between each main branch, but those in the varieties of *Duke Cherries* may be left closer together. In nailing trees leave ample room in the shreds for the swelling of the wood, and avoid driving the nails where they will come in contact with the bark, this being a fruitful source of gumming. The *Morello* and *Kentish* varieties require a different sort of pruning, as these bear on the young wood of the preceding year. Look the trees carefully over, removing such of the oldest branches as can conveniently be spared, and retaining as many of the young shoots as may be laid in without undue crowding. Bushes will require a general thinning, the removal of dead wood, and for dessert varieties the spurs should be shortened back as advised for wall trees. Where *Vines* are grown against walls out-of-doors they should now be pruned to two or three eyes, and nailed anew to the wall.

**Insects.**—The present is without doubt the best time in the whole year in which to exterminate the insects which are injurious to fruit trees, as more drastic measures may be used now the trees are at rest than when growing. In this district the winter moth is again very prevalent, and the males may be

seen flying about in great numbers in the gloaming. The caterpillars of this moth cause more destruction to our *Apple* trees than any other insect we have in this country; and trees that have been badly infested with them last spring and summer should receive special attention. As soon as the trees are pruned, the prunings, leaves, and any rubbish laying about under the trees, should be raked up and burnt; then bind a broad strip of brown paper or old cloth round the stems, and secure it there by means of twine, after which smear it with cart-grease, gas-tar, or something of a sticky nature, renewing it again and again as it gets hard. The female moth, which has abortive wings and cannot therefore fly, will thus be prevented from crawling up the trees, and they will be found sticking on the band. I find that cart-grease is the best thing for the purpose, as it remains effective for a considerable time before hardening.

For *Apple* and *Pear* trees that are affected with the mussel scale, or *American blight*, a good dressing of the stems and branches with petroleum emulsion, applied in a cold state, is very efficacious. For making petroleum emulsion the following are the ingredients:—To 1 pint of petroleum add  $\frac{1}{2}$  lb. of soft-soap, and place in a bucket, over which pour  $\frac{1}{2}$  gallon of boiling water, and by the forcible use of a syringe, mix the whole well together for about ten minutes. A painter's brush should be used for applying it, avoiding as much as possible the buds. For brown scale, paint the trees with the following home-made mixture:—Take equal quantities of sulphur, soft-soap, soot, clay, and add sufficient water so that when all is well mixed together it will be of the same consistency as paint.

As soon as the nailing of *Cherry* and *Plum* trees is completed the walls as well as the trees should be thoroughly washed by means of the garden-engine, with soap-suds or soft-soapy water. Choose, if possible, a mild day for doing it, so that the trees become dry again before nightfall.

*Gooseberry* and *Currant* bushes that have been attacked by the caterpillar should, after pruning, have all the soil under the bushes removed to the depth of 4 or 5 inches taken away and buried deeply in another part of the garden. Place fresh soil under the bushes, and give the surface a good dressing of newly-slaked lime or spent gas-lime. The bushes may be either dusted over or syringed with a mixture of soot and lime, as a means for preventing bud-picking by the birds. *A. Ward, Stoke Edith Park.*

## THE KITCHEN GARDEN.

**OUTDOOR MUSHROOM BEDS.**—These beds, if made early in the autumn, will require examining occasionally to remove any *Mushrooms* that may be fit for use; but this work should only be carried out on mild days, uncovering only a small space at each time, and returning the litter as quickly as possible. The thickness of the covering of litter, mats, &c., should be varied, according as the outside temperature is high or low, and the length of time the beds have been made. Succession beds may still be made, if precautions can be taken against getting the materials wetted by rain or snow.

**The Mushroom-house.**—As the beds become exhausted they should be removed, and new ones made up, the new materials for which will assist in keeping up the temperature, as well as affording a genial atmosphere for those beds now cropping. Any beds which are not coming into bearing as soon as was expected may be hastened by having a covering of clean straw placed over them. It is frequently the case that in *Mushroom*-houses, through defects in construction, it is almost impossible to get any produce without this covering. Any beds that require water should always have a slight covering of hay put on previously, and the water warmed to a temperature of 85°. It is a good plan to put a little liquid-manure or a tablespoonful of carbonate of ammonia into each gallon of water, the hay be removed again after a few hours or left on according to circumstances. Beds that have ceased bearing may often be restored to partial fertility again in a few days by this means. A steady temperature of 55° should be maintained in the house; and that without the aid of fire-heat, if possible. This may not always be achieved, although much may be done to raise the warmth of the house by building up new beds as previously alluded to. In no case let the hot-water pipes get too hot—but merely warm, and dryness in the air must be counteracted by keeping the floor wet. *W. H. Divers, Ketton Hall, Stamford.*

Advertisers are specially requested to note, that, under no circumstances whatever, can any particular position in the paper be guaranteed for advertisements occupying less space than an entire column.

## APPOINTMENTS FOR THE ENSUING WEEK.

### SALES.

THURSDAY,	DEC. 27	Liliums from Japan, Dutch Bulbs, &c., at Stevens' Rooms.
SATURDAY,	DEC. 29	Fruit Trees, Shrubs, Border Plants, and Bulbs, at Stevens' Rooms.

**\*\* OUR ALMANAC.**—Secretaries of societies and others would greatly oblige by forwarding immediately to the Editor notices of fixtures for the ensuing year, for insertion in the Almanac to be published in the first number of the new year. Communications should reach us not later than the 29th inst.

THE figure of General GORDON stands out as one of the noblest and most self-sacrificing of our race. Round his name will gather, and have already gathered, traditions and myths, such as are now almost inseparably mixed up with the history of the world's greatest men; but, so far as we know at least, no one has assigned him a place among the botanists. That he was no mean observer, however, and that he was well able to appreciate the facts of Nature, is apparent from an article in the current number of the *Universal Review*, attributed on the cover to "JAMES BRITTON and General GORDON," and having for its subject "The Forbidden Fruit and the Garden of Eden." The Forbidden Fruit, in the opinion of General GORDON, was none other than the double Coconut (*Lodoicea seychellarum*), whilst the Garden of Eden was continuous with the Seychelles Islands.

In this almost grotesquely absurd conclusion, it might naturally be supposed that the learned Editor of the *Journal of Botany* supplied the facts, and the late General the—well, we will not say fiction, as that might be taken offensively—the fancy. This would not be wholly correct. The botanical details are of course correctly given by Mr. BRITTON, who takes care not to identify himself with the General's fancies; but the rough outline sketches of the details of the flower and fruit made by General GORDON show that, however fanciful might be his interpretation of the facts, he had an eye to seize on, and a hand to represent, the leading features of this extraordinary tree.

Some of these drawings are reproduced in the article before us, while a series of them may be seen in No. 1 Museum at Kew, together with specimens of the wood and other portions of the tree collected by the General.

Myths of all sorts have gradually accreted round this extraordinary tree, but verily this—the latest—is the most fantastic of all. In olden times the curious shape of the fruits, their frequent discovery floating on the surface of the Indian Ocean, and the ignorance of their source, naturally gave rise to superstitious fables, and invested the nuts with a price that vies with those formerly given for a Tulip bulb, or shall we say for a rare Orchid now-a-days! Even RUMPHIUS, an acute naturalist, could only conceive that they were the product of a tree growing at the bottom of the sea.

However interesting the myths and legends collected by RUMPHIUS may be to students of folklore and ethnology, they have lost their interest since the discovery of the real nature and origin

of these singular nuts. To botanists they must always remain subjects of great interest, from their peculiar structure, and from the fact that they are natives of the Seychelles Islands, and nowhere else, and therefore afford basis for theories and speculations which are more or less in accordance with the scientific knowledge of the day, but some of which are doubtless destined to be proved as fantastic as we believe General GORDON's notions to have been. The Palm producing these nuts was figured by the late Sir WILLIAM HOOKER in the *Botanical Magazine*, t. 2734—8, and the botanical history is now pretty well known. A summary of it may be found in the *Treasury of Botany* and other text-books. Those who want to see what the tree is like should visit the Marianne North Gallery at Kew, and inspect the various articles made from the Palm in question in that establishment.

It may be of interest now to repeat the figure already given in our columns (fig. 102) representing the mode of germination of this Palm

FIG. 102.—GERMINATION OF THE DOUBLE COCOA-NUT, *LODOICEA SEYCHELLARUM*, AND BOWL-SHAPED BASE OF THE STEM (LEAF) THROUGH WHICH THE ROOTS PROTRUDE; BOTH MUCH REDUCED IN SIZE.

and the huge bowl at the base of the stem through which the roots protrude. On botanical grounds we feel disposed to say that the identification of the double Cocoa-nut with the Forbidden Fruit is, after all, supported by as good evidence as in the case of any of the other alleged sources of the sin and misery of the human race. Poor Eve must have been dreadfully disappointed with the flavour of the nut unless it was better in Paradise than it is said to be now. Probably as much, or really as little, may be said in behalf of the General's conclusions by the botanist as can be adduced by the geographer in favour of the view that the Seychelles Islands were the scene of the event which had such direful consequences:—

"Through 300 years one wild superstition after another has twined itself about this fruit, and now, towards the end of the nineteenth century on the very summit of progress and civilisation, there comes a plain God-fearing soldier, and sees in it the un-

conscious instrument of 'man's first disobedience. Some had sought for the seat of Eden by geography, and had failed; some had interpreted by allegory; some, alas! had disbelieved it altogether; but he would seek it by the plainest of all evidence, the evidence of the Maker himself, as embodied in His work. In the rumoured uses of the fruit, in its mystic shape, its duplication of form, its methods of life and propagation, in one and all of these GORDON saw, or thought he saw, an occult meaning only to be interpreted in one way. He even went so far as to draw out a chart to overcome the geographical difficulties of the question, and prove that the Pison and Gihon were to be identified with the waters surrounding the Seychelles Islands!"

**A NEW PASSION-FLOWER** (fig. 103).—Those who have had the advantage of visiting the richly stocked and interesting garden of Mr. T. B. HAYWOOD at Reigate, especially during the autumn months, must have been struck with the beauty and free-flowering property of a hybrid Passion-flower raised in that establishment. Trained fan-wise under the rafters of a greenhouse, the plant affords testimony alike of its own decorative merits and to the skill of Mr. RINDOUT, the gardener. We learn that the hybrid in question, which we propose to call the woodhatch hybrid, was raised between *Passiflora racemosa* (the *P. princeps* of gardens), and *P. quadrangularis*. The foliage, as will be seen from our illustration, partakes more of the character of *P. racemosa*, but the leaves being interspersed among the flowers, the plants have not the racemose character which is so remarkable in *P. racemosa*. The colour of the flowers is different from either of the parents. The sepals are remarkable for the very deep, wing, like that of princeps, prolonged at the apex into a curved horn. In colour they are of a dull purple, while the petals are of a pale rose-purple hue. The outermost threads of the corona are about half the length of the petals, white, with a purple base. The succeeding filaments are much shorter, also deep purple in colour, and slightly capitate at the tips. The ovary is oblong and glaucous.

**THE ROYAL HORTICULTURAL SOCIETY.**—The following communication has been received by us; "With a view to retrenchment of office expenditure, and with the hope of being able to devote more money to Chiswick, the Council of the Royal Horticultural Society have decided to leave the position of Assistant Secretary vacant for the present. Mr. CHARLES J. GRAHAM, who has so well filled that office during the past year, fully concurs in the propriety of this step, and having the Society's welfare at heart, is in entire accord with the Council's decision." The Hon. Secretary, the Rev. W. WILKS, has most kindly undertaken to be responsible for all official correspondence; and, considering the main objects he has in view—viz., the rehabilitation of Chiswick, and the resuscitation of the Society's *Journal*—we are sure that he will meet with every indulgence at the hands of Fellows and others if sometimes he finds it impossible to keep the correspondence quite up to date."

REV. G. HENSLOW.—We learn that the Council of the Royal Horticultural Society have nominated this gentleman as an Honorary Fellow, in acknowledgment of his long services as Secretary of the Scientific Committee. This is a compliment that has been more than earned, as any one who examines the "Frost Report"—the preparation of which fell to his share—will admit; and this is only one of the many services rendered by its author to scientific horticulture during many years.

**"ALL KNOWN FERNS."**—Dr. LORENZO YATES, Santa Barbara, California, proposes, if a sufficient number of subscribers be forthcoming, to publish a work under the above title, in which the name, synonym, habitat, affinity, bibliography, &c., of all the known species of Fern will be enumerated, including more than 600 which have been published

since Mr. BAKER's edition of the *Synopsis Filicum*, Dr. YATES will receive assistance from Mr. BAKER.

**THE NATIONAL DAHLIA SHOW.**—The usual annual meeting of the supporters of this exhibition took place, by kind permission, at the Horticultural

£114 10s. 6d., including £103 10s. paid as prize money; and the balance was made up by a *pro rata* deduction from the prize money of the trade exhibitors in accordance with the provisions of Rule 10. The accounts were duly passed. A conversation then took place on the advisability of forming a per-

amount of money as last year towards the compilation of a prize schedule, and also supply as heretofore cards, the necessary staging, take the entries, and print the schedule of prizes. This offer was accepted, with hearty thanks to the Crystal Palace authorities; and the first Friday and Satur-

FIG. 103.—PASSION-FLOWER: WOODHATCH HYBRID.

Club, Hotel Windsor, Victoria Street, Westminster, on the 14th inst., Mr. Harry Turner in the chair, present also Messrs. E. Mawley, T. W. Girdlestone, W. H. Williams, J. Burrell, George Harris, A. Rawlings, R. Dean, J. T. West, and H. Glasscock, Hon. Secretary and Treasurer. The balance-sheet showed subscriptions for the past year, amounting to £59 10s. 6d., and the usual gift of £50 from the Crystal Palace Company. The expenditure amounted to

manent society, with proper rules and regulations and a properly constituted executive. It was thought that if this step were taken, several of the exhibitors who do not now subscribe to the prize fund might be induced to do so. Eventually the matter was left in the hands of the committee. Mr. H. Glasscock reported that he had received from Mr. W. G. Head, on behalf of the Crystal Palace Company, a communication to the effect that the Directors would give the same

day in September were named as the most suitable days for the show in 1889, subject to the approval of the Manager of the Crystal Palace. It was resolved that for the future the judges should be selected from the exhibitors, the amateurs to judge the traders' flowers, and *vice versa*; the luncheon to the judges to be discontinued as a charge upon the balance-sheet. The schedule of prizes as offered last year was passed as that for the show in September

next. The Hon. Secretary stated that he had been in communication with the Trustees of the Turner Memorial Fund, with a view of obtaining a grant for the exhibition next year, but he had been informed that the money had been voted for the promotion of Tulip culture. Mr. Glasscock intimated that owing to age and increasing infirmities he should have to resign the post of Hon. Secretary and Treasurer, and proposed that Mr. T. W. Girdlestone should be elected in his stead. Mr. Girdlestone having consented, the proposal was seconded and the election carried unanimously. A cordial vote of thanks was passed to Mr. Glasscock for his past services. In revising the list of officers and committee, the name of Mr. H. Glasscock was placed among the vice-presidents. The following were added to the committee:—Messrs. W. H. Apthorpe and J. Burrell, Cambridge; J. Cheal, Crawley; J. Gilbert, Ipswich; W. Holmes, Hackney; Geo. Paul, Cheshunt; T. J. Saltmarsh, Chelmsford; J. H. Tranter, Henley-on-Thames; and J. Walker, Thame. The proceedings closed with thanks to the Horticultural Club for the use of the room for the meeting, and to the Chairman for presiding.

**HORTICULTURAL CLUB.**—The usual monthly dinner and meeting of the Club took place at the Hotel Windsor on Tuesday evening. The Hon. and Rev. J. T. BOSCAWEN presided, in the absence of Mr. JOHN LEE, who is, we are glad to say, making rapid progress towards recovery. There were present also Dr. HOGG, MESSRS. LINDSELL, H. J. PEARSON, C. E. PEARSON, WALKER, H. TURNER, &c. The subject for discussion was "The Chrysanthemum," opened by Mr. C. PEARSON with a most practical paper on its culture, illustrated by some very fine examples. An interesting discussion followed, in which Dr. HOGG and Mr. P. DENNY took part.

**NEW CHRYSANTHEMUMS.**—The number of reputed new varieties from all sources is so great as to become not only embarrassing in the matter of choice, but positively perplexing because of the hugeness of the lists of new varieties. The Chrysanthemum is now probably the most popular flower of the day, and when a subject reaches to such a height of popularity, a perfect avalanche of novelties is certain to descend upon the market. A list of new Chrysanthemums for 1889 has just come to hand, and for the information of cultivators it gives lists of new varieties for 1888-89. Thus Mr. Waterer sends from America twenty new varieties; Spaulding, twenty-three; J. Goode & Co., nine; making sixty-one varieties from America alone. There are six new varieties imported direct from Japan, some of them bearing names very difficult to spell, and still more difficult to pronounce; one from China; the Delaux (France) collection, always a numerous one, consists of thirty-seven varieties; Audigier sends us five; Reydellet, thirty-three; Rozain twelve; E. Lacroix, eight; Hoste, eight; other raisers (foreign), four; while, finally Messrs. Cannell, Carter, Stevens and others, make up an additional fifty-seven. This gives a list of two hundred and forty-one varieties of different sections, but mainly Japanese. It will probably be found that other catalogue makers publish forms not included in the foregoing. This is one of the penalties that has to be paid for the popularity the flower created to a large extent, or at least fostered, by the striking success of the National Chrysanthemum Society. Really it is necessary to revise the catalogue of the Society every year. But who is equal to the cultivation of all these new varieties so as to understand whether they are distinct or not?—or, if distinct, of any value? Probably of every hundred not more than a dozen in each will be fitted to take their place among the crack flowers of the day.

**"THE JOURNAL OF BOTANY."**—The December number contains articles on "The movements of the chlorophyll grains according to the direction and intensity of the light," by Mr. SPENCER MOORE; Mr. GEORGE MURRAY continues his "Catalogue of West

Indian Algae"; Professor BABINGTON contributes a sensible article on "Botanical Nomenclature," and there are numerous other matters interesting to the botanist. The horticulturist will be glad to have recourse to the convenient biographical index of British and Irish botanists compiled by Mr. JAMES BRITTON and Professor BOULGER. In the present instalment we find notices of JOHN FORBES, collector in East Africa for the Horticultural Society; WILLIAM FORSYTH, ROBERT FORTUNE, JOHN FRASER, ROBERT FURBER, and others. To indicate the nature of these notices we transcribe one relative to a man famous amongst other things for his introduction of the Catwaba Rhododendron:—

"FRASER, JOHN (d. 1750—1811: *b.* Tomnacloch, Inverness, 1750; *d.* Sloane Square, Chelsea, 26th April, 1811; *bur.* Old Burial-ground, Chelsea. Hosier and Collector. F.L.S., 1810. Published Walter's *Flora Caroliniana*. To Newfoundland, 1780; Southern States, 1785; and seven times across Atlantic between 1780 and 1810. Established nursery at Sloane Square, 1795. Collector to the Czar, 1798. Herbarium presented to Linn. Soc., 1840. Comp. *Bot. Mag.*, ii., 300; Pritz, 112; Jacks, 129, 145; Lasègue, 199; *Cott. Gard.*, viii., 250; London, *Arboretum*, 119; Faulkner, *Chelsea*, ii., 41. Litho. portr. in *Comp. Bot. Mag.*, *Fraseria*, Walt.

"FRASER, JOHN (*d.* 1799—1852): F.L.S., 1810. A.L.S., 1848. Son of preceding. Accompanied his father in his travels, and subsequently to N. America. Introduced *Dahlia* [Subsequently to Lady Bute, Ed.] Had nursery at the Hermitage, Ramsgate, 1817—1835. *Comp. Bot. Mag.*, ii., 302; Pritz, 112."

**ROYAL VISIT TO EALING.**—The decorations in the streets of this pretty suburb on the opening of the Jubilee Victoria Memorial Hall and Public Library on Saturday last, by their Royal Highnesses the Prince and Princess of WALES, deserve mention, as they were very successfully accomplished by Messrs. C. LEE & SONS, Hammersmith. The manager of the Ealing branch, Mr. GEORGE CANNON, superintended the arrangements of all the designs, and had the honour, with the members of the Local Board, of being presented to the Royal party.

**INTERNATIONAL CENTENARY CHRYSANTHEMUM SHOW IN EDINBURGH.**—A largely attended meeting of the Council of the Scottish Horticultural Association was held in 5, St. Andrew Square, Edinburgh, on the 13th inst., Mr. D. P. LAIRD in the chair, to consider the propriety of holding an International Centenary Chrysanthemum Show next year, under the auspices of the Association, in Edinburgh. It was unanimously decided to proceed with the project, and that the show should be held in the Waverley Market on a Thursday, Friday, and Saturday in November, 1889. It was further proposed that a guarantee fund should at once be opened in support of the undertaking, towards which a sum of about £60 was subscribed by the members of the Council present. The matter is being taken up with great enthusiasm by the members, and they confidently rely on the cordial support of the patrons of horticulture, gardeners, and the trade everywhere. Messrs. WM. THOMSON & SONS, Cloudford, as already intimated, have signified their intention of giving 5 guineas towards the prize list. A small committee, consisting of Messrs. ROBERTSON MUNRO, Secretary; MCKENZIE, treasurer; D. P. LAIRD, and M. TODD, was appointed to conduct preliminary matters, and a meeting of the Council was arranged to be held on an early day to receive its report.

**THE NATIONAL CHRYSANTHEMUM SOCIETY.**—The annual dinner of this Society took place at Anderson's Hotel, Fleet Street, E.C., on the 13th inst., the President of the Society (Mr. E. SANDERSON) being in the chair, a large number of members and their friends being present. In proposing "Success to the National Chrysanthemum Society" the Chairman gave a *resumé* of its operations during the past year, mentioning the fact that

at the great November show at the Royal Aquarium there were 504 distinct exhibits, that the sum of £250 was paid in prizes, and that the membership of the Society had reached over 600. Sir LOUIS PELL, M.P., and the Rev. W. WILKS, Hon. Secretary of the Royal Horticultural Society, responded to the toast of "Our Patrons, Fellows, and Guests," the former stating that while the Emperors of Japan selected as their crest the Chrysanthemum, the Emperesses took that of the Mulberry, because so useful in maintaining the silkworms, as so many of their choicest fabrics were woven from the silk thereby produced. In response to the toast of "The Hon. Secretary and Committees," Mr. W. HOLMES stated that this was the eleventh year of his holding office, and he had watched the development of the Society with satisfaction and honest pride. Eleven years ago the Society, then known as the Borough of Hackney, numbered fifty-five members, with an income of £75 per year; now it had 633 members, and its income for 1888 amounted to nearly £1000. This result had been brought about by means of unceasing and energetic work on the part of the executive committee. The year now drawing to a close had brought its quota of success. The exhibition held in the Royal Aquarium in November was the best ever seen there; the catalogue of Chrysanthemums, though deficient, was yet acknowledged to be a publication redounding to the credit of the Society. The provincial show at Sheffield, though wanting in some features, was a distinct success as an experiment; and the Conference at Sheffield was the first one held in connection with the Chrysanthemum. Mr. GEORGE GORDON also responded on behalf of the committee in a spirited address. The musical arrangements, carried out by Miss MARIE BELVAL, gave the greatest satisfaction.

**BRITISH GRASSES.**—We are informed that Messrs. LAING & MATHER, seedsmen, Kelso, N.B., have issued for the use of teachers and students of agriculture in the border counties, an illustrated manual of the principal grasses used in the district.

**CHAMBRE SYNDICALE OF GHENT.**—At the monthly meeting of this Society on Monday, December 10, the following plants received Certificates, viz.:—*Cypripedium* cardinale, shown by MM. Ed. Vervaeet & Co.; *Anthurium Andreanum* atro-sanguineum, shown by M. Ed. Pynaert, Van Geert; *Andromeda japonica* foliis albo-marginata, shown by MM. F. Desbois & Co.; and *Vriesea Marie*, shown by M. Truffaut, of Versailles. *Pandanus Desmetianus*, shown by M. L. Desmet-Duvivier; and *Euonymus pulchellus* foliis albo-marginatis, shown by MM. F. Desbois, & Co., were commended.

**CANADIAN PLANTS.**—Professor MACOON has just issued, for the Geological and Natural History Survey of Canada, the fourth part of his *Catalogue of Canadian Plants*, comprising the Endogens. No descriptions are given, but a complete list of Canadian plants, with synonyms prepared by a competent botanist, is likely to be very valuable to growers of herbaceous plants. To local naturalists the careful mention of localities will be very serviceable, and will furnish the material for an account of the geographical distribution of the species. The work, which is creditable to the Dominion and to the author, is published at Montreal by DAWSON BROTHERS.

**CHRYSANTHEMUMS AT GHENT.**—The President (Comte de KERCHOVE) of the "Société Royale d'Agriculture et de Botanique de Gand" informs us that in the year 1889 there will be held at Ghent a "Grande Exposition Internationale" to celebrate the centenary of the introduction of the Chinese Chrysanthemum into Europe. This exhibition will, it is proposed, remain open from November 23 to December 1; and all who are interested (either as amateurs or professionals) in these beautiful and popular plants are invited to enter their names as soon as possible as exhibitors, either of growing

specimens or cut flowers. Attention is directed to the fact that exhibitors need not necessarily be members of the Society or natives of Belgium.

**VITALITY OF GARDENERS.**—We learn from a Derbyshire paper that there have been great doings in Chesterfield to commemorate the Great Revolution of 1688. The chief item on the programme seems to have been a grand procession of local celebrities and societies, which paraded the town with much ceremony. The following extract may interest our readers:—"Carriage containing Mr. Adam Scott, Chesterfield (formerly gardener to the late Duke of Devonshire), aged 98 years; Mr. Allison Clark (farmer, Calow), aged 92 years; Mr. George Parker, Brimington (formerly gardener to Mr. George Stephenson), aged 88 years; Mr. William Barlow, Chesterfield (formerly gardener to Mr. George Stephenson, Tupton), aged 67—or a total number of years of 345." The average age of these Chesterfield gardeners is, therefore, over 86 years. These figures surely say something for the salubrity of Chesterfield and the neighbourhood, more for the wholesomeness of gardening as a pursuit, and most, perhaps, for the steady character of the men.

**POMOLOGY IN BELGIUM.**—We hear from M. Fr. RODIGAS, the Secretary of the "Cercle d'Arboriculture de Belgique," that there will be held in the city of Ghent during September, 1889, a great fruit show and national pomological conference. There is no doubt but that a Congress summoned to discuss such popular topics will meet with widely spread approval and support.

**THE SEASON.**—As showing the extreme forwardness as well as lateness of the flowering of plants in the open ground, we publish a list furnished us by Lady NORTHBOURNE's gardener at Betteshanger, Sandwich; and another, shorter, of Chrysanthemums from so far distant a place as Davenport Hall, Cockermouth. At Betteshanger the following were in flower:—Montbretia, Macartney Rose, Abutilons, various; Pelargoniums, various; St. John's Wort, Clematis, various; Helichrysms, various; Carnations, Anemones, East Lothian Stocks, Wallflowers, Agathas colestis, Daisy, yellow and white; Marigold, Honeysuckle, Pentstemon, Godetia, Verbena, summer Chrysanthemum, Ageratum, Mignonette, Roses, six certainly, more probably; Scabious, Antirrhinums, Pheasant-eye Narcissus, Veronica, Strawberry, Violets, Pansies, Polyanthus, Primroses, yellow and red; Evening Primrose, Senecio pulcher, Cobaea scandens, Petunias, various; Sweet Peas, Gaillardia, Tobacco, Calceolarias; Gazania splendens, Alonsona, Berberis Darwinii, Salvia patens. Mr. J. TAIT writes:—"I send you from Cockermouth a few Chrysanthemum blooms, just to show you what we can have in a mild season. The blooms of James Salter, Margot, La Charmeuse, Mons. Crousse are from a south wall; those of La Vierge and Novelty are from a west wall. Wild Primroses are in bloom in the woods, but while I write it is freezing keenly. We had a sharp frost (10°) in the beginning of October, but since the frosts have been slight. Our thermometer registered 9½° of frost on morning of 9th of present month."

**BROMELIACEÆ.**—M. ED. ANDRÉ, in the *Revue Horticole*, gives a descriptive list of Bromeliaceæ met with by him in his South American travels, among which are no fewer than eighty-three new species. A more detailed work on the same subject is in the Press.

**SKIMMIA FOREMANNI.**—We have before us shoots of this brilliant shrub, sent us by its raiser, Mr. FOREMAN, of Eskbank, Dalkeith, and bearing dense pyramidal panicles of bright coral-red berries, each the size of a small Pea. The leaves are about 3 inches long by 1 in width, oblong acute, shortly stalked, deep green, leathery, and studded with minute oil glands. The plant is stated to be a hybrid between *S. fragrans* and *S. oblata*, and has the inflorescence of the former and something of

the leaves of the latter. We regret that it should have received a Latin name, which will lead to confusion, as people will naturally consider it a species, and in conversation must naturally omit the X sign of hybridity.

The question whether this is a true hybrid or no cannot indeed be definitely solved till we know for certain what the plant called *S. fragrans* is. Some say it is a species, others that it is a sexual form of *S. japonica*. A facetious correspondent who holds this last view asks, with reference to Foreman's Skimmia, whether we have ever seen a hybrid between a bull and a cow? To which we are constrained to answer No; though if the bull were of one species and the cow of another, the offspring would be hybrid, and so it may be with reference to the Skimmia alluded to. We simply told the tale related to us. Be this as it may, the shrub is one of the most brilliantly-berried shrubs we know, and will be very valuable at this season. Like its congeners, it is probably hardy.

**CONFERENCE ON FRUIT GROWING.**—A meeting of members of Parliament was held on Wednesday, December 19, at the Westminster Palace Hotel, for the purpose of considering the extension of fruit-growing as a solution of the land problem, and a remedy for agricultural distress.—Mr. PICTON, M.P., presided over a limited audience, which included less than a score of members.—Mr. SAMUEL MORGAN having read a paper on the subject, SIR WILFRED LAWSON, M.P., said he was glad to welcome the extension of fruit-eating, but so far as his experience went on his own estates, fruit-growing had not proved a success. He doubted whether the soil and climate of Cumberland were suitable for fruit-growing. Mr. T. B. PORTER, M.P., said he had been abroad a great deal, and he could not see why a great deal of the fruit and flowers imported into this country from the South of France should not be grown at home. It was a question worthy of the attention of the Legislature and the general public. Mr. HANDEL COSHAM, M.P., in moving a resolution advocating fruit-growing in the interests alike of rural districts and congested towns, by giving employment to labour, said he was afraid our climate did not give the proper sweetness to fruit. He had tried fruit-growing in the shape of Grapes, but they cost him ten times as much as he could buy them for. Land tenure, in his opinion, was the principal obstacle to success. Mr. RADCLIFFE COOKE, M.P., seconded the resolution, but differed from the proposer as to the obstacle. After detailing valuable experiences of fruit-growing in Herefordshire, he pointed out that the movement was well worthy of support, and that it would be most unfortunate to check it by connecting it with political "fads." Mr. CHANNING, M.P., Mr. SEALE HAYNE, M.P., and Mr. JASPER MORE, M.P., supported the resolution, which was carried. *Morning Post.*

## NOTICES OF BOOKS.

**THE ROSE GARDEN, &c.** By William Paul, F.L.S. Ninth edition, 4to, coloured plates. (Kent & Co.)

To attempt any criticism of a work in its ninth edition may seem a work of supererogation, but there are some features about this edition which may justify us in doing something more than mention the publication of this new issue, and reiterating the praise already bestowed upon it. And, first of all, let us have our Englishman's privilege. Here it is. We really do not care one jot whether Sappho loved the Rose, whether she praised it or no, and to whom she compared it. We are quite ready to take it for granted that she did do what was attributed to her—but, what then? We do not learn anything from that fact, and our imaginations and emotions are not stirred by it. Poetical allusions to the Rose are very common. Many of them have no special quality entitling them to reproduction, at any rate in such a book as this, while some are

so exquisitely beautiful that we do not wonder at the temptation to quote them being too great to be resisted. Nevertheless, we doubt whether the general public, and even rosarians, would not prefer to get their poetry from other sources—best of all, from the Roses themselves—and trust to Mr. Paul's book for the science and the practice connected with the subject. Most of the quotations connected with the Rose are moreover so terribly hackneyed, that they create about as much poetic feeling in the reader as the bud of a *Maréchal Niel* or a *Niphotos* empaled on wire in a greengrocer's shop. By far the best, most varied, and least worn series of quotations are those amassed by the fine taste and graceful imaginings of the authoress of the series of articles in our columns, and which have been republished in the authoress' *Days and Hours in a Garden*, and especially in her *Ros Rosarum*, both published by Elliot Stock.

Adverting, however, to the other chapters of the book, we really have little to say further than this, that we feel disposed to praise the book in this its ninth edition nine times more than we did before; but having already exhausted our superlatives this is a difficult matter.

Mr. Paul's books have always struck us, not only by their excellence as practical handbooks, but for their suggestiveness, qualities which were remarkably observable also in the works of another great Rosarian, Thomas Rivers. It is this combination of thought with experience that renders Mr. Paul's *Rose Garden* so valuable a production, and so superior to the cut and dry performances of routine practitioners. Like Oliver Twist, however, we want more, and we could have wished that Mr. Paul could have told us why Roses do not do well in smoky towns? Probably there is some anatomical peculiarity which may explain the fact—certainly the Japanese *Rosa rugosa* does better than most Roses in such localities, and this is a Rose whose foliage, even to the naked eye, presents marked peculiarities. As for the influence of the sea air, that does but heighten the colour of the flowers. As we write, in a Kentish watering-place in mid December, Gloire de Dijon adorns many a porch in the town (Oh, what a benefactor was the man who invented that Rose!), and several hybrid perpetuals are still to be found in the gardens, while in the adjacent barren Scotch Roses, Dog Roses, and wild Sweet Briar form huge bushes. Even on the bleak, wind-swept chalk hills the Scotch Rose may be found—small, indeed, but characteristic in its spines if not in its flowers.

Into the details of culture it would be impertinent for us to enter, the name of the author is sufficient to prove that they are adequately dealt with, and we do not note nor expect any particular novelty in this direction, but the chapters on cross-breeding and hybridising we may specially commend as a standing example to be followed, and as a protest against the haphazard unbusiness-like—that is, unscientific—practices, usually followed.

The descriptive lists, of course, require constant revision, and this has been done in this edition, apparently with great judgment. Twenty coloured plates of leading varieties from the pencil of Fitch are given, as well as numerous woodcuts by W. G. Smith and others. The botanical appendix, originally written by our friend and colleague, the late Mr. Thomas Moore, has been revised by Mr. Baker, the most competent person to undertake that work. Mr. Arthur Paul contributes an article on the insects feeding on the Rose, and containing a valuable account of those insects. We demur, however, to the implication that, because the Rose belongs to the Linnean class, *Icosandria polygyna*, it therefore does not need (even relatively to other flowers) the agency of insects; and is it not time that the Linnean classes were laid on the shelf among other antiquarian and historical records? The order Rosaceæ, wide as it is, is a far more compact group than the Linnean groups just mentioned, which include many things that require a wide stretch of the imagination to see their affinity

with the Rose. The fungi and moulds affecting Roses are only incidentally mentioned, and the reader may be referred to the list given in our Rose Supplement some years since.

It remains to be said that the quarto edition before us is well and attractively got up; but for those who do not mind dispensing with the coloured plates, the 8vo. edition, otherwise identical, will be suitable. In one form or another it is quite indispensable to the library of a rosarian.

## MARKET APPLES.

MUCH attention and consideration have of late been given to the Apple, and it is to be hoped that the readers of the articles on the subject, and the country in general will derive benefit therefrom. A remarkable fact connected with some recent discussions may be noticed in reference to the varieties most generally recommended for planting. These comprise varieties which are very limited in number, and mainly of recent introduction, somewhat large in size, and seldom include the names of well-known and tried fruits.

I will admit that large fruits are the best for marketing, and have thus decided advantages, though unless they are also hardy, and good croppers as mature trees, they are wanting in essentials. For my own part, I prefer to place reliance more on the older and well tested kinds than on newer ones, some of which produce a few good specimens, but which are not good growers and bearers.

I am bold enough to say that Blenheim Orange, although not a good bearer when young, is not to be set aside in favour of any other, its handsome form and great merits having obtained for it general favour—so much so that its name has become a household word; and, however plentiful the crop of Apples may be in any particular year, this variety will always command a ready sale at paying prices.

The Apple named Dumelow's Seedling, now so generally called Wellington, or Normanton Wonder, has become very popular owing to its excellence as a good keeper and cooking variety. The variety has obtained a degree of favour to which its excessive acidity does not entitle it. Certainly it has the merit of being clear-skinned, and it often has a pretty red tinge on the sunny side. During the present season this Apple has sold at 7s. or 8s. per sieve, and 6s. per sieve net has been returned me from the Borough Market. I have never known it so acid as it is this season, and I think its generally acid juice will eventually tell against it for general cultivation, for when cooked a very large quantity of sugar is needed to make it palatable. Against this variety I would place Waltham Abbey Seedling, a most vigorous-growing variety, a nearly constant bearer, somewhat resembling Dumelow's Seedling in appearance, but when ripe of a more yellow colour, and sometimes assuming the form of Golden Noble. It is excellent when cooked, the fruit turning to a rich amber, and requiring scarcely any sugar.

Again, old Dredge's Fame is a much neglected variety. It is a free and healthy grower, an early cropper, and it might be termed a constant and heavy cropper. The fruit is above the middle size, the skin green, mottled, and much striped with red; it is in season from October to March, and is adapted either for cooking or dessert. Winter Pearmain again seems quite lost sight of, whilst King of the Pippins receives very general praise, though of the two names I believe the former to be the correct one; whether this be so or not, the variety is such a heavy cropper as a standard, as to cause the fruit sometimes to be too small to fetch a fair market price. Hence it would be preferable to plant Cox's Orange Pippin instead.

Norfolk Beefin has been recommended, whilst Striped Beefin is nearly identical. It is a superior variety, beautifully striped or coloured with red; better adapted for the market, and an equally good cropper, but it seems to be quite forgotten. A young tree which I have here bore an excessive crop this season, and though the fruits, owing to the great

number, were very small, the net price I got from the Borough Market was 4s. per sieve for some thirty half sieves.

Much has been said in favour of Lord Suffield—it is a fine acquisition as an early variety, but owing to its loose habit of growth high winds cause much loss in exposed places. Though fruiting at a somewhat younger period than other varieties, it possesses many good points. The sturdy, ever sure Hawthorn is often overlooked by framers of lists, but it is a valuable fruit. My trees bear abundantly, and I can usually gather fruit during July and the first fortnight in August, the net returns for which have this year been 5s. per sieve.

The fact really is that growers of small trees can form no real estimate of the capacity of the same trees when fully grown. Most growers of small trees, of necessity, have to transplant them periodically, a proceeding predisposing them to early bearing.

As regards the peculiarities of the cropping of Apple trees this year, I observed that the healthier any tree happened to be, the less fruit did it carry. All the trees bloomed profusely, and in size the blooms were never finer; still an exceptional scarcity of pollen was noticeable. Out of a plantation of Dumelow's Seedling, the three weakest carried very heavy crops, although the trees were but a dozen years old, and one of them produced 5 bushels of very fine fruit. Beyond this I remarked that the largest and healthiest trees produced freely upon the weakest branches—especially upon such branches as when young had been injured by American blight, so that wounds or burrs exist near their base.

I find it difficult to reconcile the two facts of large healthy trees laden with very fine bloom, which expanded at a late and very favourable season, bearing a very thin crop of fruit, whilst trees about equal in size, adjoining, of the same variety, planted alike, bloomed together, and bore heavy crops of very fine fruit. The trees grow on grass land, and the wood of each tree is well ripened, and the fruit buds prominent on all alike each autumn—and as they now are—all are treated alike, receiving a thin mulching of very finely sifted ashes in November, with a slight dressing also of stable manure about midwinter, with triennial thinnings of the shoots. Nevertheless, the fact of the extreme fruitfulness of the branches injured by American blight proves that less than a full quota of support from the roots suffices; and towards this end our efforts should be directed. *William Earley, Ilford.*

## CHRISTMAS ROSES.

I HOPE we may have the nomenclature of the various *Helleborus niger* a settled question before the nineteenth century comes to a close, otherwise we shall only have confusion, and that in another generation. I do not mean a settlement from the botanical point of view—but from that of the florist. There is not a doubt but that we have two varieties of *Helleborus maximus* or *altifolius*, the one not so early or so robust as the other, the weaker plant coming from Austrian Tyrol, bordering on Italy, and I believe recognisable as some as *Helleborus altifolius* of Heine. This plant is now made to fit that of Mr. Poë's Riverston variety, of which latter the *Gardeners' Chronicle* gave its readers a full-page illustration. I take a great interest in all the *Hellebore* group, and must say that this variety of *altifolius*, though very beautiful, is not Mr. Poë's plant, and sending it out as a match, will only cause confusion. The Riverston *Hellebore* has got strong vigorous foliage, the leaves a glossy or shining shade of green. The leaf-stalk is apple-green, and the flower-stem mottled purple. The blooms are very large, pure white, with the style or stigma pinkish-purple. It flowers early, in fact it was in flower on November 5. The flowers appear in pairs, and are of the size of those of *H. maximus*.

Then we have another introduction, a rather late-flowering variety, with interesting dark foliage and flower-stems, and the blooms purple on the outside,

a greenish white when first opening, the entire bloom toning off purplish. This plant, named *caucasicus* (?) is, when grown under glass, an excellent variety; the flowers are then almost white, and it is a profuse bloomer, and one which I confidently recommend for its vigorous growth and continuous habit of flowering. It is made to fit *H. vernalis*, but any one looking at the plate of *vernalis*, as referred to by Mr. Brockbank, of Manchester, in your paper last year, will at once see that *vernalis* has apple-green foliage and leaf-stalk, and the flower-stems at the base slightly mottled with pink. The true *vernalis* flowers with me in January and February, and the climate is much more changeable than in London. *H. caucasicus* is vernal in its blooming, but it is not the plant figured as *vernalis*. This variety of *caucasicus* has come into my possession through different channels, and is no doubt a collected plant. The last consignment of the common form of *niger* reached me from the Channel Islands. If we were to stick by the old botanists, it should, indeed, be designated the Black Hellebore. It is dark as any "nigger" in flower-stem, root, and leaf-stalk. "Apple Blossom" is a good name for *H. rubra*. I am glad to see it adopted. Some of my own seedling Christmas Roses, sown July, 1887, will flower this season. *W. B. Hartland, Cork.*

## CRATÆGUS MEXICANA VAR. CARRIÈRI.

FOR the specimen from which our illustration (see fig. 104), was taken we are indebted to the courtesy of W. G. Gumbleton, Esq., Queenstown, Co. Cork. It is a very handsome free-flowering Thorn, which originated, according to M. Carrière (see *Revue Horticole*, 1883, p. 108 *c.*, in color) as a seedling from *C. mexicana*. The foliage turns in autumn of a rich bronzed red, and remains on the tree for a long period. According to the plate in the *Revue Horticole* the haws are about three quarters of an inch long, oblong obtuse, and of a deep scarlet hue. It appears that some differences of opinion arose among the Paris botanists as to the name to be applied to this handsome species. We are unable to offer any opinion of our own upon the subject, and hence confine ourselves to the reproduction of the statement made by M. Carrière, and to the chronicling the good opinion which Mr. Gumbleton—no mean judge—expressed to us as to the value of this tree for ornamental purposes.

## USEFUL INVENTIONS.

### SUBSOIL BORER.

THERE are often occasions when an exact knowledge of the distribution—the thickness, slope, and area—of a varying subsoil is of value. It may be useful in deep draining, in well sinking, and in seeking suitable material for altering levels, for mixing with surface-soil or for making roads and paths.

In many parts of the country subsoils vary much in thickness and in character within the distance of a few yards, and in such cases the maps published by the Geological Survey, even the new maps which give the "drift" distribution, are of but small practical use. An exact detailed knowledge of the area is what is wanted, and this can be ascertained only by actual trials.

It has long been felt that our old methods for deep boring are cumbersome and costly, and only the prospect of considerable profit leads to their employment, while the methods for shallow boring are mostly unsatisfactory from their failing to bring up good samples of the materials bored into.

A revised, and, in the northern part, much modified, map of the Isle of Wight, based on the recent survey work of Mr. Clement Reid and Mr. A. Strahan, and prepared by H. M. Geological Survey, has drawn attention to a new form of borer that has been employed in this work, and also in part of the

Norfolk survey. It was devised by MM. E. Van den Broeck and A. Rutot, Conservators in the Royal Natural History Museum of Belgium, and is described by them with woodcuts and two plates in the *Bulletin de la Société Belge de Géologie, &c. (Mémoires, Séance du 29 Mai, 1888)*, tome 11, pp. 135–196.

Its great advantages as experienced in Belgium and by the officers of our own Geological Survey, are that it can be used rapidly, it brings up good samples of the materials pierced, it requires but two men to

idea was that, entirely abandoning all methods for bringing up a "core," samples of a boring should be obtained in the "worms" of some form of screw-borer. Different objections were found to different forms specially made and tried. The form adopted and now used is that known as a "worm auger," having two spirals commencing and ending on opposite sides. It is rather more than 2 inches in diameter and in its length there are five complete revolutions of the spirals, the tip of the borer ending in reflexed

this may be of importance in geological work in tracing the gradual thinning out of any particular bed, this is not likely to be needed for ordinary borings.

Those who may wish to have a borer made can, no doubt, receive permission to see one of the Survey instruments by writing to the offices, which are at the Geological Museum, in Jermyn Street, London.

## HAMPTON COURT GARDENS.

(Continued from p. 692.)

THE next mention of Hampton Court Gardens occurs in the *Privy Purse Expenses of Henry VIII.* for 1530–1533.\* From these expenses we gather that Pears (p. 249), Damsons (p. 65), Medlars (p. 176), Cherries (p. 225), Apples, and Strawberries were cultivated in the orchard, and bore fruit abundantly. Cucumbers and Melons (p. 264) were also grown, and we learn that John Chapman supplied the queen with Roses (p. 148) from the flower garden, and the "king's table" with "herbes" (p. 39) from the kitchen garden.

In 1533 the gardens underwent considerable alteration, and were to a great extent relaid by a gardener named Edward Gryffyth. From the accounts we learn that a commencement was made by digging up the greater portion of the old gardens and levelling the ground. The ground was then manured and carefully measured out into several plots, and these plots were then surrounded by brick walls.† The largest of these plots was made into the 'King's New Garden.'

This garden, from what we can gather from the accounts, appears to have been laid out into a number of square or oblong plots of grass separated by gravel walks. At certain intervals along these walks little mounds were raised, and on these mounds were placed "brassy sundials." Some fifty-six of these sundials were entered as having been bought for this garden.‡ The flower-beds were cut in the grass in oblong forms, and were surrounded by rails in a very curious manner. From the accounts we learn that 200 posts "for bearing up the rays," and "1900 yards in length of rayl" were bought for this purpose. The posts were driven into the ground at the four corners of the beds, and the rails were fixed on these, whilst the whole of the woodwork was painted with "white and green wrought with fine antic." Each post, also, was surmounted by the "Kinge's or "Queene's beastes" carved in wood. These beasts were the heraldic lions and greyhounds (the lion of Henry VIII and the greyhound of Anne Boleyn), and each had fixed on the top of its head a small "iron wayne." The arrangement of the posts and "rays," the manner of painting them, and the forms of the "Kinge's and Queene's beastes" may be well seen in the background of one of Henry VIII's great family pictures at Hampton Court. Over the rails in this garden were, in all probability, trained Roses,§ and trees of Yew, Cypress, and Juniper were planted in the centre of each bed. Around the walls of the garden were planted Apple, Pear, and Damson trees, and under these trees were probably planted the "Violets and Prymroses, Sweet Williams, Gillifer slips, Mynt, and other sweete floweres," mentioned in the accounts as having been purchased for the King's New Garden. This garden occupied the plots of ground now known as the Privy Garden.

The "Mount," a common feature in the gardens of this period,|| was next taken in hand by the gardener, Gryffyth. It was situated in the southern end of the King's New Garden. At the top of it was built

† Chapter House Accounts, C. 5, f. 42.  
‡ Chapter House Accounts, Cf. f. 148, 169. They cost 4s. 4d. each.

§ Some 500 are entered on the accounts as having been bought for this purpose.

|| Leland mentions one in the orchard at Wresshill Castle, "within about in degrees like turnings of cockshells to come to the top without payn."—*Itinerary*, vol. i., f. 60.

[FIG. 104.—CRAT. GEOMYS MEXICANA VAR. CARRIERII: FLOWERS WHITE FLUSHED WITH ROSE. (SEE P. 736.)

curry and work the apparatus even when a depth of 14 or 16 yards has to be bored and that it requires no fixed framework. It is essentially a hand-borer. MM. Broeck and Rutot style it "Un nouvel appareil portatif de sondage pour reconnaissance rapide du terrain." Although designed for geological work there is much in its easy use to recommend it for readily answering many questions connected with land culture.

The device does not appear to be registered or in any way "protected," though its present form has been arrived at only by a long series of trials with experimental and now discarded forms. The leading

"knife edges." The borer terminates a rod, the other end of which is arranged to receive a movable cross-handle. When the borer has been made to penetrate to nearly the depths of the rod of which it forms a part, the handle is removed, and another rod is affixed, and the handle put to the top of this, and when this has been worked to its depth another is added, and so on. Experience has shown that the small amount of skill that has to be acquired to work the borer lies almost exclusively in attaining the knack of removing the spiral specimens of material brought up in cases where it is wished to keep an exact record of the sequence in inches. Though

a little pavilion of trellis-work, over-roofed with planks, and around this trellis-work were trained plants of Honeysuckle and Thorn. At the top of the pavilion was fixed "a great wayne with a crown." It was reached from the King's New Garden by a winding path set on either side with Quicksets. Six loads of these, containing in all about 24,400 plants, two loads of Ash poles "for the Quicksets in the Mount in the King's New Garden," and "two bundles of rods to bind the same," were bought for this purpose. At fixed distances about this winding path were placed more "Kings' and Queens' beasts." These appear to have been different from the ones in the King's New Garden, for they were made of freestone and not of wood. They comprised in all "two Lyons, two dragons, two greyhounds, a lybret, a gryffyth, and sixteen badgers." From the accounts we also learn that "a border of Rosemary three years old," and three Pear trees, were bought for "setting about the Mount in the King's New Garden." There is also an entry for "Quicksets for the triangle at the Mount."

Another of the plots laid out by Henry VIII., was that known as the Pond Garden. There is no mention in the accounts of any plants having been bought for this garden, but we learn that around the ponds were placed the inevitable "Kings' and Queens' beasts." The entry which refers to these "beastes" runs thus:—

"Paid to Harry Corrant of Kingstone, carver, for making and entayling thirty-eight of the Kings' and queens' beasts in freestone, bearing shields with the Kings' arms and the Queens', that is to say, four dragons, six tigers, five greyhounds, five harts, four badgers, serving to stand about the ponds in the pond yard at twenty-six shillings the pece, xlix *li. viii. s.*"

These beasts were not placed upon wooden posts like those in the King's New Garden, but stood upon freestone bases and were painted in oils. Among the same accounts are also charges for "labourers lading of water out of ye Temmes, to fyll the poudes in the nyght tymes." Although the king's and queen's beasts have been removed, a portion of this garden has undergone very little change since Tudor times. It includes several little gardens separated from each other by low walls. At the southern end, in the centre of the wall, is a little arbour made of trellis-work, whilst around the walls are banks and shady nooks, such as were in vogue in Tudor times. In the centre is a sunken parterre, with a beautiful little fountain, "perhaps," says Mr. Law, "a 'survival' of one of the original ponds." Indeed, this garden retains more of the old-fashioned spirit than almost any other in England.

The fourth plot of ground was converted into the "little garden," but the accounts do not give us any idea as to the manner in which it was laid out. All that they tell us about this garden is, that "lxvii. Apple trees" were bought to be planted in it, "of a gardener of S. Jones Street, London, at *vid.*, the pece."<sup>\*</sup>

About the same year (1533) in which all these alterations were made, the "Great Orchard" was planted. In 1534 large additions were made to this orchard, and a number of trees were planted. From the Chapter House Accounts we learn that "200 young trees of Oak and Elm, five score to every hundred;" "600 Cherry trees, at *6d.* the hundred;" "five Service trees, at *14d.* the pece;" "four Holly trees, at *3d.* the pece;" and a number (not specified) of Apple and Pear trees, "at *6d.* the pece," were bought and planted in this orchard. Thirty-four bushels of "Strawberry, Prymrose, and Violet roots, at *3d.* the bushell," were also bought, and were planted beneath the trees.

After the death of Henry VIII. we hear nothing further of the gardens until the year 1561, and even then only a side light is thrown on them. When Sir William Cecil was laying out the garden at Burleigh House, he wrote to Armigall Wood, asking for his advice as to what plants he should plant in the garden, and where he should obtain them. In the reply,† dated March 7, 1561, Wood tells Cecil

that the gardener at Greenwich will provide him "with all that he can of Lavender, Spike, Hyssop, Thyme, Rosemary, and Sage," but that if more is necessary, to send to Hampton Court or Richmond. We thus see that the Hampton Court gardens were, in the middle of the sixteenth century, one of the principal nurseries, as it were, for collecting plants, and that it was from these gardens that plants were distributed to other parts of the kingdom. Five years' after the above letter was written, some alterations were carried out in the gardens under the direction of Sir William Cecil; but what those alterations were, or how far they extended, we do not know.\*

In 1583 extensive alterations were made in the gardens. The King's New Garden appears to have been entirely relaid, and its name was altered into the "Privy Garden," the name which it still retains. In the spring of this year (1583) Elizabeth sent over to France, for a French gardener named John Markye, "to repair the old gardens, and to relay plots there." The accounts and expenses incurred by this gardener are still preserved among the declared accounts † in the Audit Office, and in them are some interesting entries. They are headed after the usual endorsement "for flowers, herbs, plants, trees, earths, and sundry other monies paid for the entertainment, &c., of the French gardener, Rowland, his servant, and for sundry other gardeners and for sundry other things." Implements for carrying out the works were the first things bought. Watering-pots, brooms, shears, baskets, pails "to water the garden," and "ladders for the Frenchman and his man to work upon the hedges," are all entered on the first folio of these accounts. Several experienced gardeners and a great number of labourers were then engaged for "digging," "manuring" (twenty-two loads of horsedung were used in the spring of 1583), and for "bringing 120 loads of new earth into the gardens for making new beds." These "new beds" were planted with "slippes of Box" in geometrical figures, or in "figures like lace patterns"—a style of gardening which appears to have been about this time introduced from France. A large quantity of plants were also bought for the Privy Garden, and on the accounts are entered "double Prymroses and Daisies bought by agreement," "Lavender slippes and Daisies, and sundry slippes for borders, viiis. *vid.*," and "two bushels of Strawberry roots." Besides these plants seeds were also bought, as appears from the following entries in the accounts:—

"Garden seeds of divers sorts bought at divers times, *li. s.*"

"Sundry sorts of herbes seedes provided for the furnishing of the garden, as appeareth by a book superscribed by the hand of the said Rowland, particularly mentioning their several natures with the town's names were they were bought, *cs. jd.*"

Several other alterations were made in the other gardens in 1584 by the same French gardener. A "Box hedge xliii. yards in length," and eight Box trees were planted in the Mount, besides some "xv. lodes of Holly trees with their rootes taken out of the earth, at *xliid.* the lode." In the orchard a quantity of trees was also planted; "cdxlvii. trees bought by agreement;" "one Bay tree and one Muster († tree at *xvd.* the pece," "xxxiv Bay trees at *xiid.* the pece," and a quantity of Beech and Juniper trees are entered in the accounts as having been bought for this purpose. The salary of the French gardener, or rather the money paid for his "entertainment," was *lii. s.* the day. Robert Comte, "the French gardener's man," received "*li. s. vid.*," and "John, the French gardener's servant, *xliid.* the day. One other entry in these accounts is worth noting. It runs thus:—"For the French gardener, his servant, and Roger Overton rydlynge to Kew, Rychmond, and Mortlake, and divers other places to view the gardens there for herbes and flowers." In all, the expenses during 1583 and 1584 for "maintaining, repairing, and altering the gardens," were 843*li. 7s. 5d.*

(To be continued.)

## A POPULAR PEAR.

I HAD recently an opportunity of turning over the solid quarto volumes forming the first series of the *Transactions of the Horticultural Society of London* (1816). In vol. ii., p. 250, is a descriptive account, accompanied by a hand-coloured engraving, of the Williams' Bon Chrétien Pear, which, under its American name of the Bartlett, is a well-known and popular fruit in nearly all good fruit gardens of the United States. The specimens figured by Mr. William Hooker, F.H.S., a well-known horticultural artist of the time, were laid before the Horticultural Society in August, 1815, by Mr. Richard Williams, a nurseryman of Turnham Green, at that time a quiet little village quite near to the Horticultural Society's Chiswick garden, and only 3 or 4 miles from London.

Mr. Hooker, in his account of what he then calls "a new Pear," says:—

"This Pear, which has been called by Mr. Aiton (in his *Epitome of the Hortus Kewensis*, 1814), Williams' Bon Chrétien, appears to have sprung from seed in the garden of Mr. Wheeler, a schoolmaster at Aldermaston, in Berkshire, about twenty years ago [*i.e.*, about the year 1794, and was suffered to remain in order to prove the value of its fruit. Subsequently grafts have been dispersed, and many trees are now in Mr. Williams' nursery and other gardens round London. I have added the following description:—The trees of this variety are of vigorous growth and fertile habit; their branches remarkably erect and straight, until bent by the weight of fruit. Leaves broad, deep green, very sharply serrated. Fruit of an irregular pyramidal and somewhat truncated form; large, being from 3 to 4½ inches in length and 2 to 3 inches in width in the widest part near the head. The eye is inserted on the summit, and never sunk in a hollow cavity, as in the other varieties called Bon Chrétiens. The stalk is very gross and fleshy, about three-quarters of an inch in length. The colour of the fruit is pale green, spotted over with a mixture of darker green and russet-brown, becoming yellowish, and faintly tinged with red on the side next the sun when fully ripe. The flesh is whitish, very tender and delicate, abounding with juice, which is sweet and agreeably perfumed. Ripens in August when trained to a west wall, but on standard trees it is from three weeks to a month later. This Pear I would recommend to the notice of the Horticultural Society as superior to any of its season, with which I am acquainted. It immediately succeeds the Jargonelle, and is earlier than, and much superior to the Doyenné, or white Beurré, and resembles in flavour the Summer Musked Bon Chrétien. Its merits over the latter variety are that on standard trees as well as when trained, it seldom fails to produce fruit in abundance. The drawing which accompanies this was taken from specimens which ripened on a west wall, and may be considered of an average size; but I have seen fruit of this variety weighing from ten to twelve ounces."

So much for its English history; and on turning to Downing's *Fruits and Fruit Trees of America*, p. 421, we find its history in America pretty clearly given.

"This noble Pear," says Downing, "is justly one of the most popular of all the summer varieties. Its size, beauty, and excellence, entitle it to this estimation, apart from the fact that it bears very early, regularly, and abundantly. It is an English variety, originated about 1770 in Berkshire, and was afterwards propagated by a London grower of the name of Williams. When first introduced to this country (1799) its name was lost, and having been cultivated and disseminated by Enoch Bartlett, Esq., of Dorchester, near Boston, it became so universally known as 'Bartlett Pear' that it is impossible to dispossess it now. The first imported tree in Mr. Bartlett's grounds was sent from England in 1790. It suits our climate most admirably, ripening better here than in England, and has the unusual property of maturing perfectly in the house, even if it is picked before it is fully grown. It has no competitor as a market fruit."

The italics in Mr. Downing's account of this, the summer Pear of England and America, as well as of France and the Channel Islands, are my own, since

\* Chapter House Accounts, C. g. i. 41.

† State Papers (Domestic), vol. xvi., No. 28.

\* See State Papers (Domestic), vol. xxxix., No. 64.

† Works of Buildings, Bde. 2481, No. 64.

this property of ripening, after it is picked and transported hundreds or thousands of miles, is the point in a good market fruit when combined with the other sterling excellencies of this standard Pear. No other Pear is so largely grown and sold in our markets, and it is with some considerable pride that we claim it as a representative fruit of English origin. *F. W. Burbidge.*

## SCOTLAND.

### EDINBURGH BOTANICAL SOCIETY.

DECEMBER 13.—The Society held its second winter meeting in 5, St. Andrew Square, Dr. Craig, President, in the chair.

Amongst other interesting papers were "Observations on the Wood of Certain Resin-producing Trees," by Mr. Galletly, Curator of the Museum of Science and Art. Professor Balfour communicated a paper by Dr. J. E. T. Aitchison on the "Source of the Budsha, or Royal Salep of Southern Afghanistan," which was shown to consist mainly of *Allium*, chiefly of *Allium Macleanii*. Professor Balfour referred to the Salep mentioned in *Elia's Essays*, and desiderated information on the subject. Dr. Cleghorn exhibited a choice collection of native drawings of Indian plants which had been presented to the Library by the late William Gorrie, Esq., and at the same time laid on the table a classificatory catalogue of the series. Mr. George Bird gave his botanical experiences of the Dovrefeld, Norway, in July, 1888; while Mr. Sewell gave similar observations made during the voyage of the *Labrador* to the Kara Sea, this summer. The bright glowing carpet of the Tundras was not visible in September last in Spitzbergen; though travellers may be right enough regarding this in latitudes some 500 miles south of this northerly point.

Mr. Lindsay, curator, gave in his report for November on temperature and vegetation at the Royal Botanic Gardens.

"The past month of November has been remarkable for the extreme mildness of weather which prevailed; very seldom has there been so little frost to record during November. As a set-off, storms of wind and rain have been unusually frequent, which proved much more harmful than any seasonable amount of frost could have done. The severe gale on the 16th fortunately passed over without doing any very serious damage to the garden, further than the loss of one or two common trees. Broken branches were scattered about in all directions, until it became rather alarming.

"The thermometer was at or below the freezing-point on nine mornings, indicating collectively 20° of frost as against 49° for the corresponding month last year. The lowest readings occurred on the 1st, 30°; 16th, 20°; 21st, 20°; 27th, 25°; 29th, 30°. The lowest day temperature was 36° on the 20th, and the highest, 57° on the 25th. Rain fell on seventeen days.

"Owing to the abnormal mildness, early spring-flowering bulbous plants, such as *Scillas*, *Narcissus*, *Iris*, and the like are already far advanced in growth; buds are also starting into growth on *Ribes*, *Syringa*, *Pyrus* and other shrubs. At the close of the month fairly good summer Roses were in flower in conjunction with Christmas Roses and *Primroses*. The Holly is the most conspicuous plant in fruit out-of-doors, the berries being abundant and well coloured.

On the rock garden a good many plants are still in flower, but eight species only began to flower during November, viz., *Gynierium argenteum*, *Schizostylis coccinea*, *Parochetus communis*, *Tricyrtis hirta*, *Gypsophila Rokoječka*, *Kniphofia Saundersi*, and *Aster species*."

Mr. Bullen gave in a Report on Temperature and Vegetation for the same month, in the Botanic Garden, Glasgow.

The fine dry weather of the previous two months was continued for the first twelve days of this month. On the night of the 12th rain began to fall,

and the weather became gradually worse until the night of the 15th, when we experienced a violent storm, which continued with more or less severity the following day, doing much damage to property, and uprooting trees in great numbers in many places, particularly where exposed to the south-west. Professor Grant, of the Glasgow Observatory, records that the wind was blowing with a velocity of 68 miles an hour. The maximum pressure registered by Oster's anemometer amounted to 29.1bs. on the square foot. Since the above date the rainfall has been very heavy, and gales of considerable severity have been frequent: the mean temperature has been high. The lowest temperature registered was 29°. The thermometer was at or below the freezing point six times only, with a total of 10° as against 51° for November last year.

Mr. Lindsay exhibited and made some remarks on *Veronica Hectori*, *V. Lloganioides*, *V. pinguifolia* var., *Olearia nummularifolia*, and *Tmesipteris Forsterii*. These plants formed part of a collection received lately from New Zealand by Mr. M. Dunn, Dalkeith Palace Gardens. They were in a healthy, thriving condition after their long journey, and being of great botanical interest, Mr. Dunn had kindly presented them to the Royal Botanic Garden.

Living plants were also exhibited of *Diapensia lapponica*, *Cassiope hypnoides*, and *Tofieldia borealis* collected on the Dovrefeld, Norway, by Mr. G. Bird, and a number of interesting Alpine plants collected by Mr. P. Sewell on the desolate tundra regions to the extreme north of the Urals, during the expedition of the *Labrador*, amongst which were *Eritrichium nanum*, *Diapensia lapponica*, *Papaver nudicaule*, *Artemisia borealis* var., *Wormskoldii*, *Polemonium ceruleum* var., *Pedicularis* sp., &c.

### THE HONEY HARVEST IN THE NORTH.

Like the cereal harvest, the production of honey in 1888, in the North of Scotland, has proved the season to be one of the most unpropitious experienced in the memory of the present generation. Indeed, beekeepers have found apiculture disappointing in every respect. The cold, damp, and ungenial summer gave no encouragement for swarming, which was consequently very limited; and such as did take place was of a broken and unsatisfactory nature. The autumn was equally backward, with the result that both the Clover and Heather periods were totally unproductive, unless in very rare cases; and the harvest is, therefore, little short of an absolute failure. Extracted honey sells at 10d. per pound, and comb honey at 1s. per pound. Feeding by artificial means will have to be resorted to during the whole winter, and unless it be carefully attended to, the loss will seriously affect the brooding and honey production of not a few ensuing years, even though bee-culture should be favoured by more auspicious circumstances. *W. K.*

## NURSERY NOTES.

### CYPRIPIEDUM AT MESSRS. HUGH LOW & CO'S.

At the Clapton nurseries great provision has been of late years made for these favourite plants, a block of six commodious houses being devoted to them alone, in addition to those they used to occupy. At present a very interesting series of *Cypripedium* insigne varieties are in flower on imported plants, most of them having the *C. villosum* shaped pouch known in the admitted hybrid, *C. nitens*, and equally noticeable in that highest example of the *C. Maulei* type, *C. insigne punctatum violaceum*, a specimen of which is also now in flower at Clapton. The new importations take after this strain, but their dorsal sepals are variously marked, and have different proportions of white on them. Some have no purple spots on the dorsal sepal, others have small purple dots; some have but two large purple blotches, and some have coloured markings large and small. Some novelties may be expected out of them. In

the other *Cypripedium*-houses large quantities of *C. Spicerianum*, *C. Lawrenceanum*, *C. Haynaldianum*, *C. callosum*, *C. niveum*, *C. Sedeni*, *C. Argus*, *C. ciliolare*, *C. javanicum*, *C. Sanderianum*, and others are in flower and bud, and in the other houses a great display of spikes of most of the *Angracums* (especially *A. citratum* and *A. sesquipedale*), *Phalenopsis*, *Dendrobies* make now some show, and promise a great display in the New Year. A large batch of the pretty *Lælia peduncularis* is in bloom, a white variety being among them; with other *Odontoglossums* the rare *O. tentaculatum* is in flower; the beautiful new *Vanda Amesiana* is in great vigour, and a noble lot of *V. Parishii* and *V. P. Marriotiana* are sending up spikes. It appears that the grioter stock at Clapton gets the better the plants are managed, and the more orderly the houses are kept. The quantity of plants, such as *Phalenopsis*, *Angracums*, *Cattleyas*, *Odontoglossums*, and other things which are now cultivated there is surprising.

## HOME CORRESPONDENCE.

EFFECTS OF FOG ON FLOWERS.—It would be interesting, and probably productive of good, if those who have observed the damage done to flowers and plants by heavy fogs in winter would send notes of their experience to the *Gardeners' Chronicle*. Apparently no one has ever tried to find out what it is in the fog of London which destroys flowers, especially white ones, and makes the leaves of many plants drop off. The way the plants are affected is curious. Thus—*Impatiens Hookeri* lost every bud, but retained its expanded flowers. *Begonia socotrana* was not affected, whilst the hybrids from it and the tuberous kinds raised by Messrs. Veitch lost every flower. *Dipladenia boliviensis* lost all its leaves, *Ipomœa Briggsii* many leaves but no flowers, white-flowered *Calanthes* have shrivelled as if blasted, whilst the pink-flowered kinds are much less affected. *Randia macrantha* has held its buds, but they have changed to a yellowish colour, and appear to be unable to expand. *Chrysanthemums*, especially white-flowered kinds, look as if they had been in the fire. These disasters have been noted at Kew as the result of the foggy weather experienced up to Sunday last. *W.*

SHELL DUST.—What is the chemical difference between shells and bones? The latter are at least classed as amongst our most valuable of manures, and probably give phosphates in as great proportion as any material available for manure production. There is considerable similarity between shells and bones, but the chief point so far as their respective manurial properties, is what identity is there between them in such relation? I ask this question because I note in your report of the recent meeting of the Royal Horticultural Society's committee, that you consider calcined shells or shell-dust so produced to be little better than lime. My estimate of the manurial properties of this substance is based upon the experience of others who, in employing it for ordinary garden crops, but especially for Asparagus, Seakale, Potatoes, &c., have found it to be valuable. The material, if but lime, is certainly far heavier relatively, probably three times as heavy, thus showing that it contains matter other than ordinary lime. The shell-dust was not sent me for sale or in any trading aspect, but solely to show what sort of stuff it was, especially as it enjoyed the reputation of being such excellent artificial manure. I appended a price solely because the sender, in reply to a query put by me, stated that such figure was about the cost of production. The shells have to be gathered from the seashore, and are calcined in a kiln constructed by the manufacturer, who is a sea pilot, and conducts this manufacture for his own and neighbours' purposes, when his vocation admits of his being ashore. He is also an enthusiastic gardener. A desirable course would be obtaining a chemical test of the value of the dust as manure, especially when compared with bone-dust. *A. Dean.*

PRESERVING FORCED FRENCH BEANS.—Where forcing is carried on, regularity in supply must be the main object; and this is sometimes unattainable, owing to one lot of plants not turning out so profitable as another; and it is therefore an advantage to preserve some when there is plenty to be used in times of scarcity. The largest Beans should be cut

with stalks, put in a pan or basin, and boiling water poured on them. In this they must remain for three minutes only; then take them out, tie a piece of raffia round the stalks, and hang them up to dry. With this treatment they will keep for a month or more, and the only preparation they require is to soak them twelve hours in cold water before cooking. The Beans will come as fresh to table as if just picked from the plants, and far superior to the bottled ones. *G. Houes, Merton.*

**PEARS.**—Whether there are too many Pears in cultivation or not seems to be a matter of no great moment, as all growers can suit themselves both as to number and sorts. It would be a much greater evil if we had too few kinds than too many, but with so many we can not only make selections of the best for cropping or for flavour, but we can also select best sorts for diverse soils and localities. But there is just now matter of greater importance to discuss than is the subject of numbers. What we want to know is how many Pears are there which are good now, and will be so up to the end of March. To keep a table supplied with Pears up to the end of November is by no means difficult, but nearly two-thirds and possibly nearly three-fourths of all Pears are over or useless by the time December comes in, so that it is of the first consequence we should know what kinds are keeping not only sound, but good; that is, are good dessert fruits now. Is it possible to give a list of 12 kinds, all good, which are not only productive, but keep their fruits in good table condition for any appreciable time after Christmas. If 12 be too many, then we must be thankful if six kinds can be found, but not one should be recommended which is not soft fleshed, pleasant flavoured, and really fit for table when ripe. Then it is worth learning further under what form of culture or training are the best keeping fruits produced. Do wall fruits, or those from dwarf bushes or espaliers keep best? This branch of Pear cultivation is of the first importance, and at this season specially worthy of the fullest attention and discussion. *A. D.*

—Under this heading, Mr. Wildsmith states, that a single paragraph in a note by "N. H.P.," referring to the above subject, in his opinion, settles the whole matter, but in what way I fail to see. It may be as well to repeat the paragraph, which runs as follows:—

"It appears to me that the requirements of the family for whom the gardener has to provide as to quantity required, and the fertility of Pears in the neighbourhood must settle very largely the question of varieties a gardener grows." Taking this as it stands, we will suppose the requirements to be large as to quantity, and if so, I maintain that they can just as well be supplied by growing more trees of the best kinds named by me, than a greasy variety of inferior sorts, ripening at the same time, which, as I before remarked, only bring about complaints as to quality when sent in for dessert: for who, after one day, tasting a Marie Louise, Doyenné du Comice, Glou Morceau, or Winter Nelis, would touch a Doyenné Bousdach, Beurré de Capiaumont, or almost any other out of the list? If any employer did so, or any of his guests, who happened to be judges of Pears, did so, I think the dissatisfaction I spoke of would come in, and the gardener would most likely be made aware of it by being asked to send in the same kind they had been using before. Then the question arises, what is the use of others left on hand in the fruit room? Instead of the twelve or fifteen varieties I stand out for, as being of first-rate quality, Mr. Wildsmith states that he can name at least fifty, but by what standard he adjudicates their first-rate against those I have enumerated, I am at a loss to conceive. That there are many good kinds other than this twelve or fifteen I readily admit, but most, if not all, are autumn ripeners, and are not to be compared with Beurré Superfin, Marie Louise, Doyenné du Comice, and Glou Morceau; then why cumber the shelves with their fruit? Many argue the matter, and try to meet it by asserting that the choice Pears named are not of equal quality in all soils and districts, which is correct, but surely what tells against the best operates in an equal degree against the others, and makes the bad sorts still worse, and renders them more unfit for table. As to Beurré Rance, I only named that as one of the very latest, which we can only remain at all satisfied with till a better sort is produced to come in at the same time, and I distinctly stated that it and others, ripening after January, were uncertain, and wanted fine seasons and warm sunny aspects to get them at all up to the mark. I am glad to have the occasion to break a lance with

Mr. Wildsmith, who has so distinguished himself as a gardener, and I am proud to have had him here for a time. *J. Sheppard.*

**DISEASED VINE ROOTS.**—I enclose specimens of fungi growing upon decayed Vine roots and should be glad of your opinion of the small fungus present on the roots, and whether it is the cause of the decay noticed, or is simply a consequence of it. I may here explain that we are renewing the border entirely, in order to put in a fresh lot of young Vines, and at the same time have the bottom concreted, the old border having been made upon an open gravel and sandy bottom, out of which the Vine roots could not be kept, and which was the cause yearly of shanking more or less. Three years ago the roots were lifted and replanted near to the surface; they were all at that time in as healthy a condition as could be desired. The border was made up of the best loam to be found in the place, and I thought all would then go on right; but, to my disappointment, shanking has rather increased since the removal. I then determined to have all cleared out. In doing this I was very much astonished to find a quantity of the roots in the condition of those sent. About half of the roots are inside of the house, and are apparently in a more healthy condition. The curious part of this little annoyance

FIG. 105.—CONIOCYBE PALLIDA.

is that we cannot trace any cause whatever in our treatment that would produce it. And I should feel very grateful to have your ideas upon the subject, which my long experience fails to give. *John Webster.* [The growth on the Vine roots belongs to a lichen named *Coniocybe pallida*; the same growth has been described as a fungus under the name of *Ræleria hypogæa*, by Dr. Thumen, in his work on *Diseases of the Vine*, and by Mr. Berkeley as a fungus under the name of *Sphinctrina cormioides*. At first sight the plant greatly resembles a *Coremium* (= *Penicillium*) or even the doubtful *Vibrissæa lutea*. There is an illustrated account of this lichen, as found growing on Pear roots, in the *Gardeners' Chronicle* for January 13, 1872, p. 40.]

**CAMELIAS DROPPING THEIR BUDS.**—"What is the cause of Camellia buds turning black and dropping, and how may it be averted?" was a question put to me a few days ago by a friend. Many causes may contribute to bring about this annoying loss of flowers, but to be able to give any advice on the matter, we must first find out, if possible, the true cause of the mischief. If the plants are pot-bound, great care must be taken to see that the water does not escape between the side of the pot or tub and the ball, as it very often does when the soil is filled with roots. In that case the interior of the ball may be dust-dry, if not the whole ball of soil. On the other hand it is necessary to guard against the soil becoming too wet; and I have found the

Camellia as sensitive to neglect on this side as the others. It is often found that, when these plants that have been standing out-of-doors are housed in the early autumn, if the house is not kept as cool as possible, and all the air given them by day and night for some time afterwards, they will drop their buds more or less; and in some smoky localities Camellias do much better when kept under glass the year round. In the neighbourhood of Glasgow I never practised putting out my plants during the summer and I certainly had as fine a crop of flowers as could possibly be desired, whilst, my neighbours, who stood their plants outside during summer, had rarely a dozen good blooms off two or three dozen plants. Therefore, I am of opinion that the cause of failure in my friend's case is chiefly due to him being compelled to put them out during summer, as many others have to do. In this garden there are about six dozen plants which are now carrying a very large number of buds, and some of the plants are in full bloom; but all of them were kept inside during the past summer. *J. McIntosh, Glenmachan.*

**NEMATODE WORMS.**—I have read with much interest the Rev. C. Wolley Dod's letter at p. 608 on these little depredators. In the spring of this year the same little worm gave me much trouble, and I may say thousands of bedding plants been destroyed, and these chiefly pelargoniums. I have little doubt but that nematodes were the cause of the loss. The potting soil consisted of the materials—partly of an old hotbed, and I am led to believe that this is where we got such a brood of the worms from. There seems to be no question but that they are bred in decaying vegetable substance. Can their presence be due to anything contained in the excrement of the animals kept here? For their destruction, the Horticultural and Agricultural Chemical Co.'s worm destroyer was used. This substance will kill ordinary worms in pots, and it was used in a stronger state than was advised in the directions accompanying it, but I am not prepared to say that this dose actually killed them, but it enfeebles them, and they come to the surface of the soil, and sides of the pots. I should be glad to hear if a weak solution of sulphate of copper has been tried, and with what effect. *J. Young, gardener, Zoological Gardens, London.*

#### NATIONAL CARNATION AND PICOTEE SOCIETY.

—There are several inaccuracies in the report of the last committee meeting which I should like to correct. It is not the case that the yellow selfs may be shown in the class for yellow grounds, but the word Picotee was struck out, in order to allow Carnations to be shown as well. The sum in the Treasurer's hands was not £40, but £30, and it was to be invested in the names of Mr. Hibberd and Mr. Leonard, neither Mr. Douglas nor myself having anything to do with it. No reference is made to the fact that the scarlet and rose-edged Picotees are to be divided. *Chairman of Committee.*

**LILium NEILGHERENSE.**—A fine specimen of this Lily is now in bloom in the conservatory here. It is 6 feet high in its pot, has five flowers on the stem, and scents the house. In *Elwes' Monograph* it is said, "Though I have not seen more than three flowers on a single stem, I believe it is capable of producing far more." Perhaps some of your readers who know the Lily in its own country will inform us how many flowers they have observed in its wild state. *George F. Wilson.*

**STACHYS TUBERIFERA, KNOT-ROOT.**—We propose the name of "Knot-roots" for *Stachys tuberifera*. The appearance of the washed roots is like that of a series of five or six simple knots tied on a piece of string. *Stuart & Mein.*

**CHRYSANTHUM GRAFTING.**—During the past season I have grafted a few varieties, and carefully watched them from the beginning till the end. They were stood together in rows—the grafted on one side, and those on their own roots on the other—both plants having the same treatment afforded them. Those on their own roots were much more advanced than the others in the first part of the season, but as time went on the grafted plants began to overhual them, surpassing them in build and foliage, the latter being much more leathery. This I thought was a great improvement. The next was the bud on the self-growing plants, which made its appearance on April 30; this fact will be thought to be due to early striking, but the cuttings were put in on January 14, which I think is a good time for striking

**Chrysanthemums.** The first bud on the grafted plant did not show till June 5; then I knew which bud I had to look forward to for the crown bud, which bud I have not been able to save on the self-grown varieties, as it forms too early. The variety was Mrs. W. Shipman, a shy grower—but still it forms buds freely. I topped some of the plants of this variety on March 12, and I got the crown bud on August 20, which made a passable flower, but nothing like in size those obtained from the grafted plants, which in measurement stood 3½ inches in depth, and 11 inches round—I think that a good flower for the past season. John Salter was another improvement. It had good petals; and I have sent the whole stool to let you see for yourself how strong it was. Lady Carey was very fine, though it did not have quite the same kind of treatment as the above varieties; and it was also broken off by the wind in May, which saved me the trouble of picking it, which I should have had to do as it was growing away too fast. Two other varieties, J. Deleaux and Criterion, I have also grafted the last two seasons, as on their own roots they did not make enough roots to please me. I should like to hear the opinions of others on this method. G. Adams. [The stool sent of John Salter on Elaine was strong and well-rooted. Ed.]

**Echeveria retusa.**—We have here upwards of one hundred plants of the above in full bloom, making a fine show, with their glaucous foliage and bright coloured flowers, and which will continue in good condition for a length of time. Considering the ease with which Echeverias can be grown it is surprising they are not more common. I find that in a cool house they would not have flowered until much later, but by being placed in a warm greenhouse about October they come in nicely for brightening up the conservatory at Christmas, and as the flowers, when cut, last a long time in perfection it makes them doubly valuable. H. Saxtons.

**EARLY RHUBARB.**—Your correspondent, Mr. H. Sewell, is evidently a person who declines to submit to the rules which have to govern ordinary people. He objects to his Rhubarb being treated at Chiswick as Charles Rhubarb are, ignoring the fact that all things sent there for trial have to be tested under ordinary garden cultivation only, as the object in view in sending such things to Chiswick is to ascertain first, whether they are diverse or otherwise from similar things, and also how far, if diverse, improved features may be shown. It is impossible for that work of comparison to be carried out with fairness and usefulness if some special form of treatment or of cultivation be given to any one plant, let it be what it may, that is not given to all others. Now, as Mr. Sewell seems to be, in relation to the cultivation of Rhubarb, the depository of an important discovery, especially in promoting very early and healthy growth, and as this discovery does not at his own showing apply specially to some new sort of Rhubarb, but to ordinary Rhubarbs, why does he not unselfishly publish the nature of his particular knowledge, so that gardeners universally might put it into practice? Why, with all the Chiswick Rhubarb growing for a judge, "submit to the results of the prejudiced and the trade biased" Fruit Committee of the Royal Horticultural Society? Of course, in expecting such a course to be taken I am aware that gardeners are a rather sceptical race, and they have found ample reason in relation to horticultural discoveries to be so: still, they are not prejudiced people, and will readily accept any improvement in the art of cultivation come from whence it may. It is interesting to find that forced Rhubarb contains oxalic acid. I suppose it is just because it contains something naughty that we eat it so greedily. The world has not yet become so nervous as to be frightened from its early forced Rhubarb because it contains this terrible ingredient. A. D.

**CHRYSTANTHEMUM R.S. COBAY.**—I note that your correspondent, "M. R.D." on 703 of your last issue makes mention of Mrs. Cobay a variety with which I am unacquainted, and I, therefore, should be much obliged if he will describe the characteristics of the flower, as I am always interested in the introduction of new varieties. E. M.

**NEAL'S NE PLUS ULTRA RUNNER BEAN.**—There is no mistake in this being very far ahead of any other runner Bean that has come under my notice. I have grown it for the last two seasons side by side with other varieties, but it surpasses them all for

cropping, as also for exhibition. With me the bine and foliage are distinct, growing to some 12 or 14 feet, producing masses or clusters of splendid Beans, 10, 12, and 13 inches long, and as straight as possible. I would strongly advise gardeners to give it a trial, taking every care to procure the true stock. Those staged by Mr. Richards, of Somerley Gardens, at the Aquarum, last September, and by Mr. Waite, of Glenhurst Gardens, at Southampton, were simply perfection. J. Hughes, Eydon Hall Gardens.

## SOCIETIES.

### YORK FLORISTS'.

THIS body held its annual dinner at the "Old George Inn, York, on the evening of Friday, December 14, the City Sheriff, Councillor Matthews, presiding. After the usual loyal toasts were given and duly responded to the Chairman announced that he had received several letters from gentlemen unable to attend the meeting, and also a congratulatory telegram from the National Chrysanthemum Society, with which the York society is affiliated.

The Chairman then proposed the toast of the evening, "Success to the Ancient Society of York Florists and all lovers of a garden." He believed the Society was first established in 1720, and he need not tell them that it had had a somewhat chequered career. If it had not been for a few enthusiastic lovers of flowers it would not have been in existence. The establishment of the Chrysanthemum show, nine years ago, had contributed greatly to its strength. Its minor shows, by the kindness of successive Lord Mayors, held in the Guildhall, had been of such excellence that they had been thoroughly enjoyed and looked forward to with pleasure by the citizens generally. These shows, to which the public were admitted free of charge, were undoubtedly a great boon. Not long ago special prizes began to be offered by prominent citizens; and, though they had not the presence of the Lord Mayor, his lordship had generously intimated his intention to follow the example of his predecessors in this respect. The Society was never in a better condition. It numbered upwards of 400. It had made rapid strides in the last few years, and he hoped it would go on prosperously. He should have pleasure in giving the usual Sheriff's prize at the next exhibition.

Mr. Fielding, Treasurer of the Society, informed the meeting that the Society was in a good financial position, and possessed at the termination of the last year a balance of £150; while the annual income by donations, &c., had been £120. From causes known the money from the Chrysanthemum show had not been so large as last season; but they had no great cause of complaint. The amount received was £140; and they would be able to pay their way, with possibly a £10 or £20 to add to the balance.

Alderman Sir Joseph Terry, in the course of his remarks, said, that they had been affiliated to the National Society, and the latter Society, had their provincial show, but neither the Vice-President (Mr. Cowper) nor himself thought it equal to their own. They hoped to have this show in York next year. *Abstract from the "Yorkshire Chronicle," December 15.*

## BOTANY FOR GARDENERS.

THE last of a series of ten lectures on elementary botany and the principles of gardening, by Professor R. J. Harvey Gibson, M.A., F.R.S.E., was delivered on the 13th inst. in the Mechanics' Institute, Woolton. Mr. Holbrook Gaskell presided, and there was a crowded attendance of the working gardeners of the district. The lectures have been well attended, and appreciated by the hearers, the language employed being as free as possible from technical phraseology. The leading points of the lectures have been illustrated by artistic photographs cast on a screen by means of the oxyhydrogen light.

The Chairman, who was very cordially received, said that a very interesting, instructive, and brilliant course of lectures was now, he was sorry to say, concluded. He was quite sure that all of them must feel very much indebted to Mr. Harvey Gibson for his kindness in coming out to Woolton to give them such masterly addresses on a subject which so

deeply touched them. In the old days botany was not treated in the way in which it was at the present day by such men as Mr. Gibson. The naming and classification of the various vegetable productions of the globe constituted a large part of the science, and it certainly was a dry affair. But now they had it explained in a most attractive manner; indeed, to listen to Mr. Gibson was as enjoyable as reading a romance.

It may be mentioned here that Mr. H. Gaskell has given £5000 towards the endowment of a Chair of Botany at the University College.

Mr. Gaskell, in conclusion, proposed a vote of thanks to the Rev. George Beaumont and the committee of the Mechanics' Institute for their kindness and liberality in letting them the hall gratuitously for these lectures.

The Rev. G. Beaumont, after returning thanks, suggested, as a practical outcome of the lectures, the formation of a Gardeners' Association in connection with the Woolton Mechanics' Institute. They were surrounded by gardens and gardeners, and if such a society was formed, to embrace all the gardeners of Liverpool and the district, with the object of studying botany and gardening, as well as for mutual help, he would say, on behalf of the Mechanics' Institute, that they would be delighted to give them fire, light, and room. But if the gardeners did not see their way to do that, he hoped that they would engage Professor Gibson to form a class for the study of some particular branch of the profession which would be of practical importance to gardeners in their work.

The Chairman thought that the suggestion of the Rev. Mr. Beaumont was an excellent one, and all he could say was that if the project was taken up and they stood in need of any financial assistance he should be very pleased to come to their aid.

## COLONIAL AND FOREIGN.

### NOVA SCOTIA FRUIT CROPS: APPLE ORCHARDS, PEARS.

FRUIT culture is extending throughout the province, but principally in the two counties of Annapolis and Kings, which have long been known for their established orchards. The most successful orchard Apple this year is the Gravenstein, making an all round crop of 120 per cent. in Annapolis County, and 121 per cent. in King's, the average quality in the former being 103, and in the latter 112. The poorest cropper in King's County is the Blue Pearmain, and in Annapolis the Nonpareil. The Apple of poorest quality in Annapolis is the Flushing Spitzenburg, 60; in King's County the once famous Bishop Pippin also 60. The Baldwin is low in quality as well as in quantity this year. Other leading varieties give full or fair crops. Landowners throughout the whole province ought to feel encouraged to plant orchards, as at once a source of revenue and a means of increasing the value of their lands. A correspondent at Round Hill writes:—"Lands favourably situated where orchards have been planted have increased in value within a few years nearly 100 per cent." In Annapolis County a correspondent writes:—"We are raising a quantity of Pears: Bartlett, Clapp's Favourite, Louise Bonne de Jersey, Winter Nells, the principal kinds. The crop this year was good in quantity and quality." From the "Provincial Government Crop Reports," November.

### NATAL.

Considering that Alberta magna (E. Mey) is one of the finest flowering shrubs native to Natal, it is strange that hitherto, so far as my knowledge goes, it has not been cultivated in Europe or elsewhere. One of the Rubiaceae, and placed in the *Flora Capensis* halfway between Gardenia and Pavetta, it will probably strike freely from cuttings, and being found along with Greyia Sutherlandii at elevations from 4000 to 5000 feet, in places where snow falls nearly every winter, it may prove half-hardy in the South of

England. It is a large shrub, 5—10 feet high, with deep green shining evergreen leaves like those of *Rhododendron ponticum*. Flowers bright red, in dense terminal erect panicles 6 inches long, somewhat like *Habrothamnus elegans*, blooming in autumn, and followed by the beautiful fruits, consisting of a small dry ovary, each one crowned with two enlarged crimson calyx lobes, nearly an inch long, which are persistent, and not unlike a miniature *Poinsettia pulcherrima*. Through the winter it is a fine sight to see this shrub, tipped with glowing fire, fringing the edges of our flat-topped mountains. Planted out in a rockery in a temperate house, or even in the open, it ought to thrive well. It is figured in *Harvey's Thesaurus Capensis*, t. 45, but no mention is made of the striking appearance it presents when fruiting, which is so different from the flowers that till lately I thought the plant was dimorphous. *R. W. Adlam, Maritzburg.*

## TRADE MEMORANDA.

A MAN about 5 feet 8 inches high, with darkish complexion, with dark, long beard and moustache, moderately stout, with something rather peculiar in the look of his eyes, and who states he is gardener to a gentleman at West Hampstead, is busy in the neighbourhood of London and the suburbs, giving orders for shrubs, plants, &c. His method is to call at a nursery and select shrubs, and next morning to forward a letter, professing to come from his employer, stating that his gardener had not selected all the shrubs that he would require, and that he would send him over again to-day; and stating, moreover, how pleased he was with the last lot of shrubs he received. The man comes, selects more shrubs, and directs them to be sent by a certain day; but before the day arrives, a telegram comes, requesting the shrubs not to be sent that day, after which comes a second letter from the mythical employer, in which he tells his gardener he has made up his mind to have all the planting done by the nurseryman; but that all shrubs marked were to be sent, after he had an interview, and explained what he required done in the park and gardens, making an appointment on a certain day and hour. With this letter comes one from the said gardener, telling a tale of grief and woe—how, when he got home from the nursery he found a letter stating that his wife's mother was dead, that she had no relatives, and not a penny to bury her, and that he was in a fearful fix. To help him would I lend him a certain small sum? it would be such a favour, for he did not know what to do. The money was to be sent to Epping. The writer sent a small crossed cheque, thinking it would be a little protection in case of fraud, but the man was equal to the occasion, for knowing I had a relative in the same line, he doubled back from Epping to London, and got him to cash the cheque, and gave him also a bogus order. The fellow gets well up in his part in every way, knows the name of your late foreman (correctly), is well up in the names of plants, shrubs, &c., and does not scruple to take anything he can get. His order was, he told me, to take back six best bunches of Grapes, and the same number of bunches to be sent weekly. There is no such place or gentleman of the name given at West Hampstead, and the address of the second letter, viz., Grand Hotel, Eastbourne, is also a fabrication, no such person, I was informed, had ever stayed there. *A Victim.*

## ANOTHER ROGUE.

It would be as well to caution nurserymen and those connected with the trade to make inquiry before executing any orders they may receive from the neighbourhood of Bristol for unknown customers, as a certain individual is giving large orders for goods, while the chances of getting paid for them are very doubtful, as I am informed to-day (December 14) by a nurseryman who paid a personal visit, having received a good order, but, being suspicious, did not send the goods; and, I need not say, does not intend doing so. *A. O.*

## THE WEATHER.

[Accumulated temperature indicates the combined amount and duration of the excess or defect of temperature above or below 32° F. for the period named, and is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

## THE PAST WEEK.

The following summary record of the weather for the week ending Dec. 17, is furnished from the Meteorological Office:—

"The weather has been in a more quiet and settled condition than for some time past. The sky has, however, been very cloudy or overcast generally, and over England and the Channel thick fogs or mists have prevailed.

"The temperature has continued above the mean

in Scotland and most parts of Ireland, but over England it has been below; over eastern, central, and southern England the deficit has ranged from 4° to 6°. The highest of the maxima (which were recorded on rather irregular dates) varied from 45° in 'England, N.E., and the 'Midland Counties,' to 55° in 'Ireland, S.' Over the inland parts of England the maxima on some occasions were but little above 32°. The lowest of the minima were registered in most places during the earlier days of the period, when they ranged from 23° in many parts of England and in the south of Ireland, to 27° in 'Scotland, N., and 36° in the 'Channel Islands.' During the night of the 12th and 13th a thermometer exposed on the grass in London fell to 14°.

"The rainfall has been less than the mean in all districts. Over the greater part of England no rain has fallen, but at many stations measurable amounts of water were deposited in the gauge by the wet fogs.

"Bright sunshine has been very deficient generally. The percentage of the possible amount of duration ranged from 2 to 15 in Scotland, from 15 to 25 in Ireland, and from 7 to 28 in England."

## MARKETS.

### COVENT GARDEN, December 20.

ALTHOUGH Christmas is so near, business does not improve, buyers holding back for the end of the week. Supplies all round good. Heavy consignments of Canadian and Nova Scotian Apples. *James Webber, Wholesale Apple Market.*

### FRUIT.—AVERAGE WHOLESALE PRICES.

s. d. s. d.	s. d. s. d.
Apples, half-sieve ... 2 0	Lemons, per case ... 12 0
— Canada and Nova ... 4 6	Peaches, dozen ... 2 0
— Scotland, per barrel ... 10 0	Pine-apples, Eng. lb. ... 1 6
Cobs, 100 lb. ... 10 0	— St. Michael, each 2 0
Grapes, per lb. ... 0 6	

### VEGETABLES.—AVERAGE RETAIL PRICES.

Lilac, white Fr., bun. ... 0 7	
Lily-of-Val, 12 spr. ... 2 6	

"\* Prices for Christmas week vary so much it is impossible to quote certainly; they are generally higher about Christmas Day. Holly is well berried, and plentiful; Mistletoe in quantity, but well-berried boughs are rather scarce.

## SEEDS.

LONDON: Dec. 19.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, E.C., write that as might be expected, the seed market to-day presented quite a holiday appearance. For all de-

scriptions of Clover seeds the tone is quiet but firm. Offerings from France have of late fallen off somewhat, whilst cable advices from America report values there as exceedingly strong. Alsike, white, and Trefoil are held at former rates. In Rye-grasses there is no change. Choice samples of Blue Peas have become scarce; Haricot Beans are now good and cheap. For Hemp and Canaryseed the trade is slow.

## CORN.

*Averages.*—Official statement showing the average price of British corn, imperial measure, in the week ended December 15:—Wheat, 30s. 10d.; Barley, 27s. 1d.; Oats, 16s. 10d. For the corresponding week in 1887:—Wheat, 31s. 2d.; Barley, 29s. 1d.; Oats, 16s. 2d.

## CATTLE.

LONDON: Dec. 17.—The supply of cattle for the Christmas trade at the Metropolitan Cattle Market to-day was rather larger than in several recent years. There were on offer 7518 beasts and 12,890 sheep. Respecting cattle, it is stated that altogether the show, on the score of both magnitude and merit will rank among the best exhibitions of the kind for years past, all the various breeds being fully and well represented. Partly from the foggy weather, but more from the diminished attendance of country buyers, the trade dragged very heavily, and was very disappointing to sellers. For the best Scots 5s. was the current top price. In exceptional cases 5s. 2d. may have been made, but there were very many cases where 4s. 10d., and even 4s. 8d. per stone had to be taken for really prime beasts to effect even a partial clearance. The sheep were an excellent collection, in which the Down breeds were the most largely represented. The trade was fairly good, and prices were fairly supported; 13 to 12 stone half-breds and Downs sold at 5s. 8d. to 5s. 10d.; 11 to 10 stones, 6s. 2d.; and small choice 8 stones, 6s. 4d. per 8 lb., sinking the offal.

## FRUIT AND VEGETABLES.

SPITALFIELDS: Dec. 19.—Very good supply of all kinds of fresh vegetables, Apples, &c. Trade very dull. Quotations:—Pears, 2s. 6d. to 5s. per bushel; English Apples, 3s. to 5s. do.; do. 1s. 6d. to 2s. 6d. per half-bushel; American Apples, 8s. to 12s. 6d. per barrel; Savoy, 1s. 6d. to 3s. per tally; Cabbages, 1s. 6d. to 2s. 6d. do.; Guernsey Cauliflowers, 1s. 6d. to 2s. per dozen; Guernsey Broccoli, 1s. to 1s. 9d. do.; Spinach, 1s. to 1s. 3d. per bushel; Brussels Sprouts, 1s. to 1s. 3d. per half-sieve; Seakale, 1s. to 1s. 3d. per punnet; Parsnips, 1s. 6d. to 8d. per score; Greens, 1s. to 1s. 9d. per dozen bunches; Turnips, 1s. 3d. to 1s. 9d. do.; Carrots, 1s. 6d. to 1s. 9d. do.; Beetroots, 8d. to 9d. per dozen; Parsley, 1s. 6d. to 2s. 6d. per dozen bunches; Horseradish, 1s. to 1s. 2d. per bundle; Celery, 6s. to 12s. per dozen bundles; English Onions, 4s. 3d. to 4s. 9d. per cwt.; Dutch do., 2s. 9d. to 3s. per bag; Belgian do., 2s. 9d. to 3s. do.; pickling do., 4s. to 4s. 9d. do.; Endive, 1s. 6d. per dozen; Carrots, 26s. to 32s. per ton; Mistletoe, 30s. to 50s. per large crate; do., 9s. to 15s. per small crate; Holly, 4s. 6d. to 6s. 6d. per dozen bundles.

## POTATOS.

BOROUGH AND SPITALFIELDS: Dec. 18.—There has been a fairly good demand for best qualities, for which prices are rather firmer, but secondary sorts do not move off so readily.—Regents, Scotch, 80s. to 125s.; English, 60s. to 90s.; Hebrons, 70s. to 110s.; Magnum Bonums, 60s. to 100s. per ton.

SPITALFIELDS: Dec. 19.—Quotations:—Beauty of Hebron, 70s. to 85s.; Magnums, 60s. to 85s.; Imperators, 65s. to 85s.; Regents, 83s. to 95s.; Champanions, 60s. to 65s. per ton.

STRATFORD: Dec. 13.—Quotations:—Scotch Magnums, 80s. to 100s.; English, do., 65s. to 70s.; Regents, 80s. to 90s. per ton.

## HAY.

*Averages.*—The following are the averages of the prices obtained at the various metropolitan markets during the past week:—Clover, old, prime, 120s. to 145s.; good second, 81s. to 110s.; inferior, 45s. to 75s.; prime meadow hay, 120s. to 130s.; good new hay, 60s. to 100s.; inferior, 40s. to 70s.; old straw, 42s. to 49s.; new, 28s. to 42s. per load.

## ENQUIRIES.

"He that questioneth much shall learn much."—BACON.

CHRISTMAS ROSES AND SLUGS.—Our Christmas Roses are this year very plentiful and fine, but the appearance of the blooms is, as usual, much impaired by the ravages of a small black slug. Can anything be done to destroy or trap this pest? *Leirion.*

## NOTICES TO CORRESPONDENTS.

ADDRESSES, &c.: *G. Martin.* For the South African Philosophical Society address to Prof. McOwan, Botanic Gardens, Cape Town, South Africa. The address of the *Garden and Forest* is Tribune Buildings, New York, U.S.A. *My Garden* is a book by A. Smea, containing an account of horticulture, at his residence, The Grange, Hackbridge. We have never heard of the "Union Centrale des Sciences Naturelles d'Angleterre." "Indian Orchidology" is a paper published many years ago in the *Journal of the Linnean Society*. An account of the Indian Orchids is in course of publication in the *Flora of British India*, by Sir J. Hooker (published by L. Reeve & Co., Covent Garden). The last part issued contains few of the Orchids.

ARUM FLOWER: *B. Primrose.* The doubling of the spathe of the flowers of this aquatic is by no means a rare occurrence.

BEES: *C. R.* Apply to Mr. Neighbour, 149, Regent Street, London, W.C.

BOOKS: *G. Matthews.*—Ferns: *Select Ferns*, by B. S. Williams, Paradise Nursery, Upper Holloway, N. Bee-keeping: *Bee-keeping*, by A. Rushbridge, E. W. Allen, Ave Maria Lane, E.C. Roses: *The Rose Garden*, by W. Paul: *The Rose Amateur's Guide*, by T. F. Rivers, Longmans, Green & Co., London; and *Roses in Pots*, by Shirley Hibberd, Kent & Co., Paternoster Row. Orchids: *The Orchid Grower's Manual*, by B. S. Williams, Holloway, published and sold by the same.

CERTIFICATED PLANT: *H. J. B.* The list published in our last number only contains, as is stated, the names of plants certificated during the latter half year. Your plant was shown early in the year, and you will find we record it in the list of certificates for the first half year, published in our issue for June 30 last, p. 799.

CORRECTION.—In report of the Royal Horticultural Society, in our last issue, at p. 709, col. a, third line from the bottom, for "former," read latter.

CYPRIPEDIUM: *H. J. R.* The forms you name have not been botanically described, so far as we know. They are probably forms of *C. praestans*, except the one said to come from Nepal.

HOT-WATER PIPES: *A Head Gardener.* Lamp-black and boiled Linseed-oil may be used to paint hot-water pipes without any ill-effect being observed on plants; but it is always advisable to heat the pipes several times whilst the house is empty of plants. It is nonsense to say that painted pipes give off an appreciable less amount of heat than unpainted.

INSECTS: *J. C.* The very minute white scale-like insects on the leaves sent are the immature states of a tiny four-winged fly belonging to the genus *Aleyrodes*, which has the same habits as the Aphides. *I. O. W.*—*E. M.* A form of cockroach. As the trap has failed to catch them, why not try arsenic in treacle or, drive them away by placing kerosine acid in their haunts. Are you sure they have ever got into the traps? for it seems to be next to impossible that such a creature could escape after once getting in.

LIFE HISTORY OF MIGNONETTE: *Reseda.* We know of no work where you will find what you require.

NAMES OF FRUIT: *H. Barry.* Your Pear is Josephine de Malines.—*W. H. Cutbush.* Apple Hollandbury.—*A. Neilson.* 1, Beurre Rance; 2, Winter Crassane; 3, Colonel Vaughan.—*W. Fisher.* Large fruit, Warner's King; small, Non-such.—*F. S.* 1, Vicar of Winkfield; 2, Easter Beurre; 3, Josephine de Malines.

NAMES OF PLANTS: *G. M.* 1, *Sophrontia grandiflora*; 2, *Bifrenaria racemosa*, probably, but pollinia absent, and flower withered; 3, *Cattleya leucola*; 4 and 6, not recognised with sufficient certainty; 5, *Rodriguezia planifolia*.—*W. M.* Cypr-

pedium insigne var.; *Lælia peduncularis*; *Vandatri-color*.—*M. Burne.* 1, *Monochatium ensiferum*; 2, *M. sericeum*; 3, leaf of *Hamanthus coccineus*, probably; 4, *Diaplasma glutinosus*; 5, *Salvia* species: send again when in bloom.—*E. Rylands.* The name *Eurybia* is probably correct, but we cannot tell the species from such a small, unfowered piece.—*E. O. R.*: 1, *Abutilon* Boule de Nègre; 2, *A. striatum*; 3, *Abutilon*—a rose-coloured hybrid.

PATAGONIA: *J. C. G.* A good many numbers of the *Gardeners' Chronicle* would not suffice to tell you all you wish to know. Climate temperate to antarctic; good in Argentine Republic, villainous in Southern Patagonia. Spanish and Italian languages, besides the native tongues. No particularly "ferocious" animals. *Lapageria*, *Phileasia*, are two well known garden plants from this region. You should consult the books of travel of Darwin, Ball, Hooker, &c., besides botanical books descriptive of the flora.

PLANT CULTURE, &c.: *N. N. E.* 1, *Sobralias* may be repotted any time after flowering and before new growths commence. 2, It is natural for the leaves of deciduous Dendrobies to turn "yellow and fall off when drying them." It is an indication of the ripening of the pseudobulbs necessary before flowering. 3, *Phalaenopsis* should be kept moist all the year round, but have the least water between the months of October and March. Direct sunlight is injurious to them in hot weather. As near as possible to a temperature of 60° Fahr. by night, and 70° by day, all the year round, is the best for them, but of course in summer that will sometimes be exceeded. 4, We know of no work such as you describe, but we do all we can to meet the want in these columns.

RATING GREENHOUSES: *A Constant Subscriber.* If you turn to our issues, vol. xxiv., pp. 153, 183, 498, 720, 758, and 816, vol. i., 3rd series, pp. 422, 650, and 676, you will find very useful information for your guidance.

SKIMMIA: *M. D.* The germination of the embryo while still in the fruit is not uncommon in Oranges and Lemons, to which the *Skimmia* is nearly allied. A similar phenomenon often occurs in *Pernethya*.

STRAWBERRY PAULINE: *Thirty-five Years' Subscriber.* This variety is not grown largely for market purposes, so far as we know, but being large, early, and of good flavour, and a heavy bearer, it should give satisfaction to growers for market. If you have runners for sale, advertise them in our columns.

WASPS' NEST: *C. W. W.* A nest of 12 inches by 11 inches is of an unusual size. You do not say if it was a hanging nest or a nest built in the ground; the former seldom reach the dimensions given. There are persons who will buy anything, so there is hope for your cottager if it be advertised.

PROPAGATION OF FIGS: *H. P.* The best time to make cuttings of any species of *Ficus* is from the middle of February to the end of March; and the place—a moderate hotbed of 75° to 80° bottom warmth; and if many are to be struck, the bed may be prepared with light sandy loam, covered with a layer of sand, no pots or pans being employed. The best part of a shoot for a cutting is not the soft point, but a piece lower down, which has begun to get woody, and which may be cut with three or four leaves. After the cuttings are made by removing the bottom leaf, the wound at the top being closed with grafting wax, they should be lightly potted head downwards, covering all parts except the base, with some light earth, and left for twenty-four or thirty-six hours, so that the milky piece may exude, and the wound get dry. This proceeding holds good with all hardwood exotics with milky juice, some—*Euphorbias* for example, not being inserted in the soil for twenty-eight days after being made. The buds of *Ficus* if furnished with a leaf may be used to raise plants, but it is a slow job. We have no experience of seedling *Ficus*, but should suppose that, provided the seed be good, strong plants might be raised in three years from time of sowing the seed.

COMMUNICATIONS RECEIVED.—*M. B. M.* (many thanks: no room).—*T. S.*—*A. O. W.*—*H. J. R.*—*D. T. F.*—*J. B.* & *Sous.*—*D.* (sent to the authority concerned).—*G. H.*—*Gleishurst* Compound.—*J. H. ## No. 74.—THREE-QUARTER SPAN GARDEN FRAME.

The most useful of all frames that are made, owing to the extra height and convenience for attention. The sashes are 3 inches high at front, 24 inches high at back, and 32 inches at the ridge, bolted at the corners, easily taken to pieces if required. The Lights are 2 inches thick, fitted with set-opes, and arranged to turn over, back and front, for ventilating. Glazed with best 21-oz. English glass, and painted four coats.

## MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus.

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price 2s. post-free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country, an inspection of this Catalogue shows, therefore, the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made and gentlemen waited on in any part of the country. Plans and Estimates free on application.

## HOT-WATER BOILERS,

And others with SHELVES, and Hollow or Ordinary Cast-iron GRATE BARS.

### SADDLE BOILERS.

With WATERWAY BACKS and WELDED BOILERS, any of which are specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c. They are the neatest, cheapest, most effective, and durable of any extant.

The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.

These Patterns secured the FIRST and HIGHEST PRIZE—a SILVER MEDAL—at the Royal Horticultural Society's Exhibition, South Kensington, London, June 1, 1881.

### The Best Boiler Extant.

— FRONT ELEVATION —

— LONGITUDINAL SECTION —

SECTIONAL PLAN

The longitudinal section gives a view of the fire-box, water space, flues, &c. The cross section gives a view of the fire-box, water space and V-shaped back. The front elevation shows it set in brickwork, which is necessary for this class of boiler.

### TESTIMONIALS.

Messrs. THOS. GREEN AND SON, LTD., NORTH STREET, LEEDS.

GENTLEMEN,—I have great pleasure in bearing testimony to the efficiency and satisfactory working of the Hot-water Heating Apparatus you erected in these public buildings. The buildings are four stories high, and we have a total length of about 28,000 feet of piping in them, varying in size from 1½ in. to 8 in. diameter, with their connections, &c. The several offices and rooms can all be in operation at one time or separately, and the heat regulated by means of the valves to the temperature required, even in the coldest weather.

Two of your Patent Municipal Pattern Boilers, No. 4, work the whole of this piping easily, although we have three of them fixed. They are very powerful and economical in the consumption of fuel, and I am pleased to be able to report of them and the apparatus so favourably.

GENTLEMEN,—The large Municipal Boiler which you sent me last year is doing its work satisfactorily; it is heating 5,000 feet of 4-inch pipe in one of my vineries, and I am quite sure that it has power to work a much greater length, while in cost of fuel it compares favourably with my other Boilers.

I have now five of your Boilers in use, and I cannot speak too well of their heating powers, or their comparatively small consumption of fuel.

Messrs. THOS. GREEN AND SON, LTD., LEEDS.

AND HUNDREDS OF OTHER REFERENCES CAN BE GIVEN IF REQUIRED.

## NEW PEA, "SHARPE'S QUEEN."

Our New Pea—Queen—in habit, cropping qualities, colour and flavour is the perfection of a Pea for every purpose, and by successive sowings, so continuous a crop can be obtained, that it will be almost unnecessary to cultivate any other variety. The Queen is a blue wrinkled Marrow Pea, about 2 to 2½ feet in height, of a sturdy branching habit; it requires to be sown thinly, as the pods are produced from the very bottom of the plant to the top. The pods are

large, green, slightly curved, and so filled with Peas that when opened it would appear impossible they could be contained in the pod. The Peas are large, oval, deep green, and of a delicious flavour when cooked.

We feel we cannot say too much in its praise, and are confident our customers will agree with us that it is one of the very best Peas ever sent out.

Price 2s. 6d. per Pint Sealed Packet; 1s. 6d. per Half-Pint Sealed Packet.

For full description of the above, see *SHARPE'S SEED LIST* for 1889, Post-free on application. Trade Prices on demand.

**CHARLES SHARPE & CO., SEED GROWERS AND MERCHANTS, SLEAFORD.**

## WEEKS'S

### PATENT DUPLEX UPRIGHT TUBULAR IS THE PRINCE OF BOILERS.

*It has the longest record of any Hot-water Boiler extant.*

*It has Hollow Furnace Bars, which last 11 years longer than solid ones, and add 20 per cent. of power.*

*It has facilities for being easily repaired.*

*It has means of removing sediment.*

*It has proved a real boon to Gardeners.*

*It has been a source of profit to employers.*

## SCIENTIFIC PRUNING AND TRIMMING MADE SAFE, EASY, AND RAPID.

### THE GIANT PRUNER.

*The New and Latest Invention for Scientific Pruning and Training on a large scale.*

The great success of the "Standard" Tree Pruner and the "Myticuttah" has induced us to give our attention to the production of a somewhat similar implement, but of a much more powerful construction. In the Giant Pruner you have a tool capable of EASILY cutting a branch 7 inches in circumference, with an exerting pressure of 1½ tons.

Prices and Lengths in future Advertisements.

For Illustrated Price Lists of above and other Novelties in Pruning Tools, Fruit and Flower Gatherers, &c., apply to the Principal Ironmongers and Seedsmen at home and abroad; or of the

Small size, Length 18 in.  
Price in box 8/6.

Post-free 6d. extra.

### "MYTICUTTAH"

(Registered Trade Mark and Title).

Patented in Great Britain, France, and Germany.

Hitherto, strictly correct Pruning could only be done by holding the branch with one hand and using a Knife with the other, but then only for small branches, whereas the "Myticuttah" itself holds the branch, cutting over an inch in diameter, and in case of prickly bushes, &c., it saves the hands from injury. Garden and Lopping Shears, which hack and bruise the branch, are entirely superseded by this new Patent, and its many advantages will at once commend it to the practical Gardener or Forester.

Post-free 1/6d. extra.

Large Size, 21 inches long.  
Price in Box 9s. 6d.

Sole Proprietors and Makers: **THE STANDARD MANUFACTURING COMPANY, ST. ALKMUND'S CHURCHYARD, DERBY.**

**NEW PATENT (No. 9090, 1888) HORIZONTAL TUBULAR BOILER,**  
Which is, without doubt, the Best All-round Boiler in the Market.

*It combines all the ad-  
vantages of its class so well  
known, and by the improved  
method of forming the  
joints—viz., with India-  
rubber Washers, the old  
and too often ineffec-  
tual way of caulking  
the joints is entirely  
dispensed with.*

*It can be erected in a few  
hours, and may be relied  
upon as a thoroughly sound  
and good Hot-water Gen-  
erator. It has been care-  
fully tested in every possible  
way, more especially with  
regard to power and dura-  
bility, and the result has  
been highly satisfactory.*

CONSIDERATIONS.—Prices are quoted in English Sterling, and where not otherwise stated, relate to plants collected from their natural habitat, delivered free of all charges at the port of shipment. From there Buyers take all risk and expense. The price per 1000 plants is charged on orders of 500 and upwards; that per 100 plants on orders from 50 and upwards. On orders of 2000 plants of the same species a reduction of 15 per cent. is allowed; while on less than 50 plants of the same species a higher rate of 50 per cent. is charged. The packing is executed under F. C. Lehmann's personal care, and the methods employed are those which an experience of over twelve years has proved to give the best results; but under no condition will he hold himself responsible for the state or condition of the plants on their arrival; and Consignments once shipped at the port are entirely at the risk and expense of the persons who have ordered them. To secure the arrival of the Plants in good condition, Consignments—if not expressly otherwise ordered—will be dispatched only when the Plants are in fit condition to travel; the months being January to April, and July to October; and as the communication in this country is defective and wearisome, and the months being few during which shipments can be made, orders should be sent in as early as possible, so as to allow ample time for their execution. The amount of the Orders will be covered by Bills of Exchange drawn on the issue of the Bills of Lading; amounts under £25 payable three days after sight; above that amount 90 days after sight. Payments may also be effected through Messrs. ROSSING BROTHERS & CO., 10, Basinghall Street, London, E.C.

## NEW CUCUMBER.

DANIEL'S MASTERPIECE.

We have in former years introduced some remarkably fine Cucumbers, but never had more pleasure than in introducing this one, as it is without doubt the handsomest Cucumber ever raised. The fruit are slightly spined, and of a rich emerald-green, 20 to 30 inches long. For colour, quality of flesh, symmetry of form, constitution, and prolificness, they are models of perfection—a grand exhibition fruit, and far surpasses most other kinds for market purposes. For many years the fortunate raiser has enjoyed the monopoly of this variety, his fruit taking a leading place in Covent Garden Market, bringing a much larger return than other kinds, and it was not until this last season that he could be induced to part with the stock, of which we have secured but a limited quantity. Per pkt., 1/6 & 2/6.

DANIELS BROS., Seed Growers, NORWICH.

As a Supplement to the  
GARDENERS' CHRONICLE

FOR

Next Week, January 5,  
will be Published an Ink Photo of  
THE GRAND CASCADE,  
Wilhelmshöhe, near Cassell; also a  
SHEET ALMANAC.

As a large EXTRA circulation of this Number is guaranteed, it will be a very valuable medium for Advertisements.

Advertisers desirous of securing space in this Number are requested to communicate not later than DECEMBER 31, with the publisher, W. Richards, 41, Wellington Street, Strand.

## ART AT CHRISTMASTIDE.

THE President of the Royal Academy, Sir

Frederick Leighton, has lately been expounding his views on British art and Britain's want of art, to the National Art Congress, of which he is also the President. His address is at once eloquent and comprehensive. He earnestly appeals to his countrymen to assist him in placing beauty in its due place in the work and pleasure of the nation. While freely admitting that the National Gallery is rising steadily to a foremost place among the famous galleries of the world, he complains of our general incapacity to appreciate true excellence in art, or to take a vivid interest in beauty for its own sake. He alleges that we have no adequate sense of the value of art as an element of national greatness—little or no pride in the achievements of English artists. Even when we are not quite insensible to the charms of beauty, we do not detest sufficiently what is hideous and ignoble, nay, we have come to bear with much that is vulgar or commonplace with dull, indifferent acquiescence. The great want, in Sir Frederick's estimation, is the love of art as art, or of beauty for its own sake, and not the spasmodic or desultory pursuit of either which is our general characteristic. The standard of our art-education must be raised until all classes become endowed with the instinctive consciousness of what is beautiful and of what is ugly; and which will enable them to choose the former and reject the latter. Sir Frederick thinks that the perception of beauty and the appreciation of art are dormant rather than dead in our national character, and he would rouse them into action by the display of objects of beauty and by a thorough instruction in the principles of art.

Sir Frederick did not touch, as he might have done, on beauty in the garden, or he might perhaps

B.S.WILLIAMS

## SPECIALTIES

IN

## Flower Seeds

FOR

1889.

Sold Only in Sealed Packets Bearing my Trade Mark.

## AGERATUM "ADA BOWMAN" (New).

This new variety, which was raised at Hylands Park, is without doubt the finest Ageratum grown for bedding purposes. It blooms in masses from the time of planting out until it is cut down by the frost, and requires no pegging down, as it is only 9 inches high; the trusses measure from 6 to 7 inches across. It is of a very effective and telling delicate blue colour.

Most valuable when propagated in pots in the autumn for early winter flowering. Its freedom in blooming is so pronounced that each pot is quite a ball of flower, and continues so to the middle of January.

Per Packet, 1s. 6d.

CYCLAMEN PERSICUM GIGANTEUM  
"AURORA."

This magnificent variety is of very compact habit, with beautiful rosy-pink coloured flowers deepening to a fine carmine at the base. It is a tint of colour which is very marked and conspicuous, and will make addition to these popular plants.

Per Packet, 2s. 6d. and 5s.

## FRANCOA APPENDICULATA.

A splendid herbaceous perennial, which will be found exceedingly useful for conservatory decoration; it produces long branching spikes of pale rosy-purple flowers, which are larger and more compact than *F. ramosa*, and the flowers are closer set on the spike. Invaluable for cutting purposes.

Per Packet, 1s. 6d.

## GLOXINIA "GOUVILLE STRAIN."

I have much pleasure in being able to offer, through the kindness of the Comte de Gernminy, seeds of this splendid strain, which has the reputation of being the finest on the Continent. It invariably takes First Prizes whenever exhibited. The flowers are of immense size and substance, of very brilliant and varied colour, beautifully tigered and spotted, and contain a fair proportion of self colours.

Per Packet, 2s. 6d.

PRIMULA SINENSIS FIMRIATA  
"MAGENTA QUEEN" (New).

This new variety is of very compact habit of growth, very vigorous and robust; the leaves are of a dark green colour. The blooms are very large, measuring upwards of 2½ inches in diameter; they are of a very good substance and a bright magenta colour, with a small bright lemon eye. It is quite a new colour in Primulas, and its distinctness is very pronounced.

Per Packet, 2s. 6d. and 5s.

STOCK, INTERMEDIATE, WILLIAMS'  
"CRIMSON GEM" (New).

This variety, on account of its charming and decided colour, is an acquisition of considerable merit, as it is a great advance in richness and brilliancy of colour upon any known kind of Stock. It will be found very serviceable for spring bedding, window boxes or pots, where it will produce a wonderfully fine and pleasing effect. It is of a dwarf compact habit; the central spike and lateral branches produce a great profusion of very rich crimson blooms of very large size.

Per Packet, 1s. and 2s. 6d.

## Illustrated Seed Catalogue for 1889

Is now ready, and will be forwarded Gratis and Post-free to all applicants.

have drawn a more flattering picture. Our landscape gardening is, as a rule, better than our architecture, and our flower-beds are not so rankly abominable as once they were. A finer sense of gradation and admixture of colour, of light and shade, a keener appreciation of proportion, a fuller recognition of the beauty of appropriateness, are manifest within the last quarter of a century; while the productions of the florist, though often manifesting want of knowledge of what is fitting under some circumstances and inappropriate under others, may certainly be cited as proofs that the artistic faculty is not dead amongst gardeners.

But if we look to the "decorations" of our homes and churches at this season we have not much to boast of. Properly managed, the annual decoration of our churches and homes at Christmas and other festivals might form practical lessons in art and be made instrumental in quickening our perception of the beautiful. But if Sir Frederick Leighton is severe on our pictures, what would he not say were he to take a run through our churches at this season? And yet there is much in these that lends itself to treatment that might deserve the name of art. Statelyness and magnificence in the architecture, light, shade, and colour, frequently blended in the most artistic proportions; culture and taste in the decorators—all the social light and educational leading of the parish being, as a rule, engaged in the work—and yet the result is too often utter failure.

So complete is the failure that the majority of our readers will possibly think art degraded by having church or hall decorations named in connection with it. But why should not our church and home decorations be beautiful instead of ugly? Or if our efforts must end in ugliness, why not cease to attempt to decorate? By ceasing to do evil in this matter we should, at least, avoid the slaughter of tens of thousands of innocents in the shape of fine Hollies and other shrubs; but surely, with such rich stores of material as we have in these alone, it is possible to do better, and to add the charm of brilliancy and grace to the formal lines and cold hues of our stately architectural grandeur.

To this end a light touch and cultured taste are the chief desiderata. A mere frieze of natural forms, a sparse use of Holly berries or other colours, may result in artistic results of a high order—while the usual crush and mixture create a mere sense of bulk and effect the conversion of hundreds of churches at Christmastide into something akin to a woodman's shed, piled up with wagonloads of choice evergreens.

In the interest alike of Nature and of Art we protest against this wholesale vandalism and destruction. It leaves nothing better to show for it than hideous decorations, and cleared shrubberies and pleasure grounds. It has run into dimensions of waste and ugliness undreamed of by any but those who are expected to supply the decorative wants of towns or parishes in populous neighbourhoods in the provinces or near the metropolis. As reasonably purchase pictures by the yard or the mile—or assess their worth by the quantity of colour smeared on the canvas, as attempt to make decorations beautiful, or raise them to the dignity of art, by the mere quantity or magnitude of the materials employed.

**MESSRS. HOOPER & CO. (LIMITED).**—At a meeting of the Board of Directors of this company on the 10th inst., the usual interim dividend at the rate of 6 per cent. per annum was declared.

## NEW OR NOTEWORTHY PLANTS.

### CYPRIPEDIUM TAUZTZIANUM VAR. LEPIDUM ×, n. var. *hyb.*

Mr. W. BULL has been so fortunate as to raise this lovely hybrid. The type was said to be very scarce, if not unique. I have the impression that Mr. Tautz showed me his plant stating it to be unique, with an amateur's proudest smile. Mr. W. Bull availed himself of *Cypripedium niveum* and *C. barbatum* Warneri. It is a most interesting fact that there are discrepancies not altogether dependent on individual differences. The odd sepal is much shorter, and totally lacks the green median nerves of the typical plant. There is nothing but a white ground, with mauve-purple nerves, and some very small blackish-purple spots. Petals as in the type, but apparently broader. The connate sepals form a very narrow body, whitish inside, not striped at all. The fine lip is nearly unlobed around the sac. The staminoide is very dark, with two much darker black-purple eyes. Bract exceedingly short, scarcely surpassing the pedicel, just reaching the base of the long ferruginous ovary. Leaf pallid garlic-green, with numerous angulate dark green markings, as seen in the species of the affinity of *Cypripedium barbatum*.

The numerous riddles these hybrids propose may perhaps never be solved. The pollen parent has flowers of the chastest white with a little lemon-yellow. How can we now account for that elegant clean pure mauve-purple—the great charm of Mr. Tautz's *Cypripedium*? It is glorious even on the lip. And now compare the decidedly not very clear colours of *Cypripedium purpuratum*. Whence comes the lovely elegance of colour? *H. G. Rehb. f.*

### ALOE (EUALOE) LONGIFLORA, Baker, n. sp.\*

This is a new large Aloe from the Cape, nearly allied to *A. vera* (barbadosensis). It has been grown for some time by Mr. F. W. Moore at Glasnevin, under the name of *A. pluridens*, Haw, which it most resembles in leaf, but now that it has flowered it proves to be a new and distinct species, remarkable for its long corolla and much exserted stamens.

Stem simple,  $\frac{1}{2}$  foot long below the rosette of leaves; rosette of leaves spreading laxly over the uppermost root. Leaves spreading, ensiform, 15–18 inches long,  $1\frac{1}{2}$  inch broad, low down, tapering gradually to a long point, unspotted, glossy green, flat on the face in the lower half, armed with crowded spreading green deltoid marginal teeth,  $\frac{1}{2}$ – $\frac{3}{4}$  inch long. Inflorescence a dense simple raceme, 6–8 inches long, longer than its peduncle, which has many empty bracts; bracts ovate, scarious,  $\frac{1}{2}$  inch long; pedicels ascending, not longer than the bracts, articulated at the apex. Perianth cylindrical, primrose-yellow,  $1\frac{1}{2}$  inch long; tube oblong,  $\frac{3}{4}$  inch long; segments ligulate, connivent, tipped with green. Stamens finally  $\frac{1}{2}$  inch longer than the perianth; anthers small, oblong, red. Style reaching to the tip of the anthers. *J. G. Baker.*

### PLEUROTHALLIS PUNCTULATA, Rolfe, n. sp.

Very few species of *Pleurothallis* are considered of value from a cultivator's point of view, though there are some exceptions, and those who find room for a few of the more attractive species will probably consider the present one worthy of a place. Its flowers are an inch long, light yellow, copiously spotted with purple-brown, much in the way of a *Restrepia*, though they do not open so widely, and the pollen masses are two only, which unmistakably fixes its position. The plant was sent to me by Messrs. James Veitch & Son, of Chelsea, and was received by them from New Grenada three years ago. It is a dwarf

\* *Aloe (Eualoe) longiflora*, Baker, n. sp.—Caule simpliciter elongato; foliis ensiformibus viridibus laxo rosulatis dentibus marginalibus crebris patulis deltoidibus haud castaneis; pedunculo brevi, racemo denso simplici; bracteis ovatis scariosis; pediculis bracteis aequalibus; perianthio cylindrico luteo, asquipoilleari, segmentis ligulatis apice viridi tinctis, tubo oblongo triplo longioribus; genitalibus longe exsertis.

plant, the stems about 2 inches high, slightly two-angled. Leaves lanceolate-oblong, subacute, suddenly narrowed below into a short petiole, fleshy, glaucous, at least below,  $3\frac{1}{2}$  inches long by 1 inch broad. Peduncle solitary (always?) in axil of leaf,  $2\frac{1}{2}$  inches long, from a narrower tubular spathe 1 inch long. Upper sepal lanceolate, oblong acute; lateral pair connate into a concave, oblong body, the minute acute points only free; colour as given above. Petals broadly lanceolate, acute, suffused with light rose-purple, and spotted with purple-brown,  $4\frac{1}{2}$  lines long. Lip 7 lines long, somewhat three-lobed, oblong, obtuse concave, not fleshy, shortly fimbriolate, papillose inside, with darker papillae on a maroon ground, with three blackish lines inside, which are light green outside; side lobes rounded, and folded round the column. Column wings a little undulate. It apparently belongs to Lindley's group *Aggregata*, and although somewhat anomalous here, still I cannot find a better place for it. It is a very distinct species, and I cannot identify it with anything in this large genus. A curious feature in the piece sent is that the leaf has a sharp twist at the base, by which the flower hangs pendulous under the leaf. It may, however, be an accidental occurrence. *R. A. Rolfe.*

### ONCIDIUM CRISPUM (Lodd.) subleve, Rolfe, f. OCHRACEUM, n. var.

This is a very fine variety of the old *Oncidium crispum* subleve, which is deficient in the lateral calli on the sides of the mid-carina. The flowers are ochre-brown in colour, and show no vestiges of that copper colour so predominant in Messrs. Loddiges' plant. I never saw anything like it before. Two plants only were imported by Messrs. Stuntleworth, Carder & Co., 192, Park Road, Clapham, S.W. *H. G. Rolfe, f.*

### RODRIGUEZIA FRAGRANS.

This Brazilian Orchid (fig. 106) is an old inmate of our Orchid-houses, and best known under the name of *Burlingtonia fragrans*. Its delightfully fragrant white flowers with yellow centres are grateful everywhere, but from the neat habit of the plant it is especially acceptable in collections where the space is limited and the house small. Like the rest of the genus, it thrives best and is safest in baskets suspended near the glass of the roof, and after the pseudobulbs are fully matured it should be carefully but sparingly watered, sufficient only being given to keep it plump and healthy. During its inactive season a place near a ventilator in the Cattleya-house in which it is growing, or in some other part of the house, where a good air not heavily charged with moisture assists in ripening its growth.

## NEW DEVELOPMENTS IN HORTICULTURAL DECORATING.

GLASGOW may be truly designated the "happy hunting ground" of the horticultural decorator. Business men of all classes are calling in his aid to increase the attractions of their warehouses, shops, and offices. They are no longer content to rely on architectural art and decorations in paint and gildings, to embellish their splendid places of business and enhance the attractions of their wares, but are vying with each other in rendering them fragrant with flowers, and rich in the elegance of exotic foliage plants. From the fish and game dealer, and the butter and cheese factor to the draper and house-decorator, all are taking the matter up with enthusiasm. Even certain of the churches demand the services of the horticultural decorator weekly, and the Athenæum, clubs, and libraries, as may be expected, are not behind in a movement of this kind. Hotels, restaurants, and other places of entertainment have for some time back done a little in the way of table decoration; but now they are extending their efforts to meet the growing taste of the public in

this direction. The cabins of the Anchor line of steamers are regularly and sumptuously decorated with plants for each voyage, and the *Columbia*, so well known to tourists, has adopted the idea in her cabins.

Newspapers of the city have their offices decorated with plants, and are even contemplating introducing them into the compositors' rooms as a relief to the tedium of their occupation.

delightful movement that pleases every one, from the warehouseman to his customers, and even the listless loungeur, who casts a passing glance on his windows, is arrested and interested with the pleasing effect produced by the association of real flowers and foliage with every description of merchandise.

The movement has been initiated by Messrs. J. & R. Thyne, nurserymen, seedsmen, and florists, of St. Vincent Street, Glasgow, who have long been favourably known as specialists in horticultural decoration. They have long endeavoured to interest business men in the matter of decorating their business premises, and have succeeded at last in getting them to perceive its advantages. The system is carried out on the contract principle by the month or the year. The plants are at the risk of the contractors. They are placed, watered, cleaned, and otherwise attended to by their own staff; and so large an amount of stock is beyond their control in the premises of others, that they have recently taken the prudent measure of insuring against the contingency of fire.

Their nursery at Kelvin-side, near the Botanic Gardens, is wholly composed of glasshouses, adapted specially to plant growing. To a large extent the stock consists of Palms, Dracenas, Ferns, Orchids, Asparagus, Bouvardias—in short, every class of plants adapted to the decorative florist's art, which is their specialty. There is also a large and varied stock of plants grown to meet the general requirements of their customers and the public. Good cultivation is a feature of the place in every department, and taking into account the wear and tear inflicted on the established stock of the decorative sorts, the absence of cripples and maimed plants is remarkable.

## THE HERBACEOUS BORDER.

### CHOICE OF SUBJECTS.

In examining the original list supplied by Mr. Horsfield (p. 510), it will be observed that the front row of plants would be nearly bare of flowers for nearly nine months of the year, there being two July flowering plants in the Campanulas, and the *Dracocephalum* in the same month, or sometimes in August; the *Helebore*s flowering next in point of time—viz., in December.

Such gaps in the season of bloom as these are not likely to suit many persons, especially as they occur at a time when the garden should be the gayest. In my front row list, on the contrary, it will be found that a variety of showy plants will be in flower from the first week in December to the end of August without any break, the *Violas* continuing even longer than that, if not required for stock; and moreover, every plant named is as easily grown as the *Snowdrop*, which comes first on the list.

It is doubtful if such weedy subjects as *Tussilaginis* are fit companions for *Gentiana verna*, *Hepaticas*, or *Veronica repens* [reptans]. The height assigned to *Galegas* and *Iris sibirica* scarcely accords with their height as grown here, and which is much greater than that given. It is a common occurrence here to find *Iris sibirica* growing to a height of 4 feet when established and in flower.

In reference to *Onosma tauricum*, it is a Boragewort of great beauty, and very fragrant, but the plant is not "miffy" when it is not coddled in a frame, or subjected to damp in the winter-time, and few plants are more hardy. The plant, if grown in too rich a soil, will be apt to rot off at the same season of the year. I have some potsful of it that have stood out unprotected for three successive winters, and which have not even been plunged in any protecting material. These flower well annually. When planted out the *Onosma* requires a sandy loam and the drainage should be good; it may be propagated with perfect ease, and a few should be raised annually, so that any losses may at once be made good. The right place for *Gentiana verna* is not the herbaceous border, but the rock garden, where a cool, moist position ought to be

FIG. 106.—*RODRIGUEZIA FRAGRANS*: FLOWERS WHITE WITH YELLOW CENTRES. (SEE P. 756.)

Certain of the banks also have groups of foliage plants or specimens of Palms and *Dracenas* displayed in their handsome halls and vestibules, and last, but not least significant, two of the leading

Enough has been said, I think, to justify the opening assertion. I am not aware that in any other city in the kingdom so much interest is taken as in Glasgow in horticultural decoration. It is a healthy and

afforded it, employing a loamy soil to plant it in. The *Veratrum* mentioned in Mr. Horsfield's note are better suited for the botanical garden, because of the digyness of their flowers, and although their broadly ovate foliage is handsome, and for this reason some semi-wild place is the best one for them. The *Tritomas*, *Tekias*, *Bupthalmums*, *Bocconia cordata*, *Centaurea macrocephala*, possess ornamental foliage, and are much superior in flower to the *Veratrum*. *Aster grandiflorus*, as a rule, does not expand a flower-bud at all in one season in six, and therefore it is not a desirable plant for a flower border in any part of the country. The number of fine species and varieties of perennial plants suitable for a flower border is so great, that only those should be chosen, all inferior plants being discarded by the gardener. *E. Jenkins*.

## PLANT NOTES.

### GREENHOUSE RHODODENDRONS.

In the Rhododendron-house at the Royal Exotic Nursery an answer to the oft-repeated question, Where shall we go for flowers after the *Chrysanthemums* are over? is indicated by the great display of rich colour given by over 300 trusses on plants of Messrs. Veitch's R. javanico-jasminiflorum strain, which when grown in quantity is perpetual flowering. Especially beautiful are R. Ophelia, pink with yellow tinge; Lord Wolseley, Indian yellow with crimson anthers; Thetis, chrome-yellow with crimson anthers; Star of India, yellow; and Souvenir de J. H. Mangles, reddish-buff, a very large and finely formed flower.

### BEGONIA WINTER GEM (B. SOOTRANAX B. SCARLET TUBEROUS).

At Messrs. James Veitch & Sons' this vividly coloured new variety is in flower in many neat specimens covered with bright carmine-crimson flowers borne above their fresh-looking bright green leaves. It is the perfection of a winter flowering plant, and it will not be detracting from its merits to say that it is a worthy companion to the profuse flowering B. John Heal, a large batch of which brightens up the same house. Like B. John Heal, too, it bears all male flowers, which accounts for its lasting so long in bloom. Flowers of B. Winter Gem which opened on November 23 are still good. *J. O'B.*

### RHODOCHITON VOLUBILE.

This is a very graceful and free-flowering climber for the cool-house; it climbs by means of its petioles and peduncles, which twist around suitable foreign bodies that it may chance to come into contact with. When this plant is in full vigour it would be difficult to find anything on the roof of a cool house to surpass it in beauty. The flowers hang in profusion from the slender stems like so many rose-coloured bells; from these the corolla rises, protruding beyond the very dark red calyx. Cuttings strike slowly but surely if placed in a cool house beneath a bell-glass, but as seeds are produced freely these afford the best means of propagating it. They flower so freely at times as apparently to completely exhaust themselves. Several plants have come under my observation which kept up a grand display for a long period, but gradually declined when no other reason than that stated could be assigned for their so doing. When they are required to cover a good space, they should be planted out into a compost of loam, leaf-mould and sand, in a well-drained border. No doubt it would do well in the summer planted out in warm situations. It is a Mexican plant, and was figured in the *Botanical Magazine*, t. 3367.

### PENTAS CARNEA.

This, a charming low growing plant from South Africa, with flesh coloured flowers, and if these have been regularly picked off throughout the summer, and attention given to them as regards potting, &c., they will now be found very useful for cutting from.

They enjoy a light position in the cool part of the stove. Plants may be readily raised from seed, or from cuttings whenever obtainable. *F. Ross*.

## THE APIARY.

### WINTER TREATMENT OF BEES.

The doctors of bee-keeping do not agree on this subject any more than doctors of medicine do on the maladies which afflict man. One says, keep them thoroughly warm, while another says they would do much better if they were colder. Some say, let the hives be turned towards the north during the winter, so that the sun may not tempt them out-of-doors; while another would turn them to the south in order that they might get a flight. Still another sage says that good luck, like the wise men, comes from the east. Some bury their hives in holes underground, while others desire theirs to be put in a loft nearer the skies. Who shall settle it? There seems to be little doubt that bees have done well under all these conditions. We are not one of those who think all men are liars, like the ancient king, but consider there is some other solution. We have repeatedly said, and reiterate it again, that a strong stock of bees can take care of itself, even as the donkey that danced among the chickens; while a weak stock will succumb, no matter which way they are turned, or how much they are covered. Shall we, then, neglect them, that strength may show its superiority over weakness? This would be very foolish. By all means keep the bees warm. Make them as snug as possible, and see that no wet gets into their hives. Above all, take care if snow approaches. Mr. Pettigrew used to say that a bee falling on the snow seemed to succumb quicker than if thrown into the fire, and so it would if left alone. It would soon revive if picked up at once, and put in a warm place. A strong hive may soon be depopulated by the bees dropping into the snow. Bees cluster in winter for warmth, and the colder it is the closer they cluster together. A few of the outside ones may fall and die, but that will not much matter. We are very much afraid that bees will be scarce next year. Many cottagers have lost all their swarms through the unlucky season of 1888, and neglecting to feed them.

The present is the time to be preparing for the next campaign. If your hives are home-made, make them; and if not, get them now. Dealers would execute the orders better and cheaper now than further on. Reversing has been before mentioned as productive of large harvests if done intelligently, and we are glad to find Professor Cook, of America, a staunch advocate of it. It seems that skeps are the best hives to invert, as they are inverted both safely and quickly. Messrs. Edey & Son, of St. Neots, supply a skep fixed into a bar-framed hive. The swarm is put into the skep, and when inverted, the bees rush up into a bar-framed hive, and fill it. Try it. *Bees*.

## PLANTS AND THEIR CULTURE.

**STREPTOCARPUS.**—These are very pretty and interesting plants, allied to the *Gesneras*, of easy culture, and free flowering. The plants ought to be more commonly grown, and such species as *Rexii*, *biflorus*, *polyanthus*, and *parviflorus* would, I feel sure, make capital market plants. Their cultivation is within the reach of all those possessed of a heated house, and where only a greenhouse is at command the selection had better be confined to the sorts above mentioned. The huge one-leaved, red-flowered varieties, as *S. Dunnii* and others, similar, which have recently been introduced from Zululand and the Transvaal, like a somewhat higher and drier atmosphere than that of a greenhouse. But even the warmer sorts will succeed if in summer they are allowed the maximum of light, heat, and air obtainable in an ordinary greenhouse, and a temperature in winter not falling much below 50°, provided the plants are

not kept too wet, if so the leaves have a tendency to rot off, which, of course, spoils the plants. The best mode of propagation is by seed, which is usually produced plentifully. The seeds are small, and should be sown in small pans filled with a finely sifted compost of about equal parts of loam, leaf-mould, and sand. After filling the pans give a gentle watering, and sow the seeds thinly on the moist surface, cover with a bit of glass, and stand them in the propagating house, taking care to place them in such a position that no further watering may be required until the seeds have germinated. A good plan, if they show signs of getting dry, is to stand them in saucers into which a little water is put; but just now (and this is about the best time to sow) if they are stood on some moisture-holding-material, further watering is rarely required.

As soon as the seedlings are well up—usually about six weeks from the time of sowing—they should be pricked off somewhat thickly, in pans or small boxes, with a sharp-pointed bit of stick, in a similar manner to that practised with young Ferns. Light wooden boxes, about 20 inches by 12, made of three-sixteenths of an inch broad, and from 2 to 2½ inches deep, are very convenient for propagating-work. For the first few months much more progress will be made if they are kept in the propagating-house, or where a temperature of about 60° is maintained. Under this treatment the little clumps pricked off will grow rapidly, and before they get crowded in the boxes they should be potted up, using a compost similar to that recommended for the seed-pans, but without it being sifted, and a little well-decayed manure or other fertiliser, might be added with advantage.

The size of pots in the first year should not exceed small 32's, but 60's and 48's are usually quite large enough. By the time the plants have got to this stage, an ordinary greenhouse is the more suitable place for them, if it is in summer, as it will be, if the seeds are sown now, shading the plants from direct sunshine. Towards the end of the summer, if all has gone well, they should begin to flower; when if removed (that is, if in a frame) to a light position in the conservatory, they will keep throwing up their flower-scapes for a long period of time. A speedy way of producing an effect with these plants is to plant a number of them in pots or pans; these quickly form an effective mass, and they may be potted up after flowering for use the next season. It may be remarked that they look best when the depth of pot or pan does not exceed 6 inches. These make capital subjects for planting around the edges of beds in conservatories or underneath the plant stages, but in such places the flowers usually get spoiled, and are rendered useless as cut blooms. For cutting purposes the species first mentioned are well adapted, having stout stalked scapes of flowers of good substance, varying in colour from white to lilac, or blue, more or less striped with chocolate or purple-brown on the three lower lobes of the corolla. *S. polyanthus* and *caulescens* are two interesting species, with sky-blue flowers; the last-named is an erect branching species. Several interesting and beautiful hybrids, between *Rexii* and *Dunnii*, have been raised by Mr. Watson of Kew, two of which, *Watsoni* × *Kewensis* × received Floral Committee Certificates last year from the Floral Committee of the Royal Horticultural Society. *F. Ross, Pendell Court.*

## THE FLOWER GARDEN.

**OUTDOOR FERNERY.**—If not already done these should be fenned and put into as neat and trim order as circumstances will allow. It is not to be expected that at this season it will present an attractive appearance, and cleaning must not be taken too literally; for instance, all dead fronds of deciduous species should not be removed from the rootstock for the present, but allowed to remain till the time of renewed activity, as they are the best of protectors in severe weather. Hand weeding may be done when the weather is open, and fallen leaves and dead sticks from overhanging trees removed. Examine the labels, re-naming such as require it. Although we have not as yet experienced frost sharp enough to injure the more delicate North American and other exotic species, it will be advisable to have protecting material in readiness in the event of a change to cold weather. Amongst those requiring protection I may name *Polystichum proliferum*, *P. setosum*, *Lastrea atrata*, *L. a. decurrens*, *L. opaca*, *L. frondosa*, *Cytrotrium*, *Struthiopteris germanica*, *S. japonica*, *Woodwardia radicans*, *W. japonica*, and *W. Fortunei*. The

majority of the above being evergreen species the Ferns ought to be protected with pieces of matting or similar material, and, in addition to this, a good surface dressing of cocoa-fibre refuse or half-decayed leaves might be employed. New work and alterations should be pushed on during the mild weather. In the making of outdoor ferneries no pains should be spared at the outset to render the work of an enduring character; and I would mention two or three essential points: 1st, situation; this should be rather moist and shaded than the contrary, and if the ground is undulating with large trees close by, so much the better. The soil is another matter of importance, for if the staple is unsuitable for Ferns, some other must be substituted, and this may consist of sandy loam, leaf-mould and peat—the latter, in which the roots of wild Ferns abound, is the best. In the matter of planting, and in the choice of suitable species and varieties to plant I would say that in all cases where an intimate knowledge of Ferns is lacking, the matter should be left entirely in the hands of a nurseryman who makes a specialty of Ferns, as by so doing disappointment in results is likely to be averted. Suitable accommodation in the way of rockwork should also be provided for a few of the smaller growing species, such as *Ceterach officinarum*; many of the *Scolopendrium*s, and some of the *Asplenium*s will also delight in such surroundings, and it would greatly add to the attractiveness of the fernery, if a narrow stream of water could be introduced, near to which some of the hardy "filices," such as *Hymenophyllum tunbridgeense*, *H. ulniferum*, and *Trichomanes radicans* might be grown. All these, and many other points are matters of detail which ought to be taken into consideration and decided on their own merits in each individual case. *J. Horsfield, Heytesbury.*

## FRUITS UNDER GLASS.

**PINES.**—Plants, which are swelling their fruits, must be carefully supplied with weak guano, or Thomson's manure, every time they require water, and sufficient should be given to saturate the whole ball, no more being given till the plants are dry. Let each plant be examined once or twice a week as to its condition. Some plants may require water oftener than others according to their situation. Plants which are plunged in a bed of moist leaves or tan will not require so much water as plants wholly dependent on fire-heat for bottom temperature. Whenever the fruits show colour see that the soil is in a healthy condition as regards moisture, and if any be necessary give then, but no more till the fruit is cut. Regulate the atmospheric moisture by the state of the weather. If clear and bright, the paths should be damped the first thing in the morning, and again about 1 p.m., when the air has been shut off—the surface of the bed, and all wall surfaces, being sprinkled at this time, but avoid as much as possible damping the foliage; 85° to 90° for bottom-heat, 65° to 70° as a night temperature; but if the weather be of a character demanding the use of much fuel rather decrease the moisture, and allow the temperature to drop to 60°, as a cold frosty night is generally succeeded by a clear sunny day; 80° as a day temperature; 85° with sun and air, which must be admitted at the top of the house, and with care close the ventilator in time to run up a temperature of 95°, and have the fire stirred to prevent a too rapid decline of the temperature. The night temperatures are to rule from 10 p.m. to dawn.

**Early Starters.**—If not already done, no time should be lost in getting these prepared. Select only such plants for this purpose as are likely to start without making a growth, and subject them to a bottom-heat of 90°. See that they are in a proper state of moisture at the root when plunged, and be careful of watering much until they throw up their flower heads. If too much water be given they will in all likelihood start into growth instead of showing fruit; maintain 65° to 70° as a night temperature, 80° to 85° by day; and similar treatment as regards moisture in the atmosphere as that recommended for plants swelling their fruit. The plants intended for starting in February should be kept as quiet as possible, but the structure in which they are to be started should be got in readiness; and the plunging material should be renewed if necessary, so that the rank heat may subside prior to the plants being introduced. Keep these and all successional divisions at 55° to 60° at night, and 65° to 70° during the day with sunheat, airing on all favourable occasions.

**Vines.**—The early house will now be making rapid progress. Let the forcing be conducted as much as possible during the day. Where the leaves are developed cease the use of the syringe and damp the paths and ridge of fermenting leaves. Temperature 55° on cold nights and 60° on mild will be a sufficiently high until the Vines come into flower, when 65° to 70° should be maintained, with 10° higher by day—5° more being allowed with bright sun. Do not damp down the house in the morning when the Vines are in bloom, and towards midday distribute the pollen with a Pampas-grass plume. Damp the surface of the border at 2 p.m., when the house is to be shut up for the day. The tying down of the shoots must be very carefully undertaken else they will in all likelihood break off, but there is no need for hurry in this matter if the foliage be kept clear of the glass until such time as the Vines are coming into bloom, when the shoots will bend very freely. A watering of tepid water should be given to the border prior to the Vines blossoming, and the beds of fermenting leaves may receive a slight addition, if the heat has declined; and during the blossoming stage of the Vines the daily turning of a portion may be dispensed with.

**Pot Vines.**—Much of that which has been recommended in regard to permanent Vines applies to these, only that every attention to watering and the due administering of weak manure stimulant must be duly carried out as recommended in the Calendar for December 8, giving top-dressings as frequently as they appear needful. Keep a steady root temperature of 85° by slight additions to the fermenting leaves.

**The Second-house** will now be swelling fast, and due attention to disbudding must be paid. When the buds are fairly burst, 55° should be the minimum night temperature, and 60° that by day; cease syringing the canes, and supply the necessary moisture by damping down. Prune all late vineries as they are cleared of fruit, and get them cleaned and prepared for starting.

**The First Muscat-house** should now be shut up, and fire-heat applied by the middle of the month. Grapes still hanging on the Vines should be examined at short intervals, and decaying berries removed, but considering the bad influence light has on black Grapes in lightening their colour, it is by far the best method to cut them with a good length of wood, and to place them in bottles in a dark room. Where convenience for this does not exist, a shade of brown paper may be laid on the trellis over the bunches. When the weather will allow, admit all the air possible, and keep a slight warmth in the heating apparatus, to expel damp; and when the weather is foggy keep the ventilators closed and the temperature as near 45° as possible. When hard frost necessitates the warming of the house the warmth ought not to exceed 40°. *Wm. M. Baillie, Luton Hoe.*

## THE HARDY FRUIT GARDEN.

**APRICOTS.**—These trees being the first to bloom, the pruning and nailing of them should be finished early in the New Year, and this year more especially, the weather being at present so very mild; and the swelling of the bloom-buds will be hastened considerably. I always endeavour to have the trees here pruned and nailed as early as possible, so that on the approach of frosty weather some kind of protection may at once be placed over them, if the state of the bloom-buds should seem to require it. The summer pruning of fruit trees, often before alluded to in my notes, applies also to the Apricot, and when this has been performed the present pruning, will not be of a severe character. All dead snags must be cut away and the spurs shortened to three or four buds. Young trees that have made strong shoots from cutting these left entire, as no good can accrue from them, but in fact, it is very often the cause of a great deal of gumming taking place in the trees. These strong growths should have their tips pinched when they begin to grow, which will cause them to produce numerous laterals. The fore-right ones should be pinched in, and to form spurs, the others laid in, and the trees will thus be quickly furnished with bearing wood, as these laterals will generally become studded with bloom-buds in the following autumn. Where gaps have been caused by branches dying off during the last season, it will always be good practice to lay in enough young wood to fill them up, than to attempt to move one or more of the older branches out of their old position for

that purpose, the old wood of the Apricot being of a very brittle character which will not bear any force being employed in bending it one way or the other, and once the tissues are ruptured, gumming at once sets in, and the branch dies shortly after being moved. After the nailing is done, subject the trees and walls to a thorough washing with soap-suds with the garden engine, and if the trees are infested with brown scale, paint them with a home-made mixture, such as was recommended for Plums in my last calendar, p. 731.

**Currants.**—Those where grown on north walls should be spurred in to two buds, and with regard to old trees, lay in some young wood at the base for training up as branches, so that the old ones eventually may be cut away. Examine the shreds, and make good deficiencies, well washing the trees afterwards with a solution of soot and lime. Point the alleys over to the depth of 2 or 3 inches, and dust the surface well over with newly slaked lime.

**Orchards.**—Examine the young trees, and shorten or remove altogether any branches that are likely to grow in the wrong direction, and cut off the points of any others that stand in need of it. Old trees that have been neglected will require the removal of the cross and interlacing branches, and the crowns should be thinned out, so that as much sunlight and air as possible will reach the inner part of the trees. If infested with lichen, dust the trees on a damp day with soot and lime, or syringe them with those substances thoroughly mixed in water. I had a great many trees so treated last winter, and the bark on stem and branch is now bright and healthy.

**General Work.**—As soon as the nailing of trees is finished the alleys will require attention, as the soil will have been trodden very hard. They should be forked up to the depth of a few inches, afterwards applying a mulching of dung to any trees which seem to stand in need of it. Apple and Pear borders should also be lightly dug over, and the digging of bush fruit quarters proceeded with after pruning the bushes. *A. Ward, Stoke Edith Park.*

## THE KITCHEN GARDEN.

**FRENCH BEANS IN POTS.**—These require a nice light position at this part of the year, a temperature of 65°–70°, with plenty of moisture in the atmosphere, and they should be assisted when the roots fill the pots with weak manure-water at each alternate watering. Light turfy loam, pulled to pieces by hand, mixed with half decayed leaf-soil that has not been sifted, or old Mushroom dung, is the best kind of compost for Beans, and at this season it should be made warm before sowing the seed. Eight-inch pots are about the best size for most varieties, but 6-inch ones will be large enough for small growing varieties, or indeed for most others in the winter months. Some gardeners sow the seeds in 60's first and repot afterwards, but I have found the French Bean to do best if this disturbance is avoided by sowing the seeds in the larger pots. As they only remain in the pots a short time the drainage required may be of the slightest—one good sized crock over the hole and a handful of the rough part of the compost over this being sufficient for the purpose. The pot should only be made about half full at the time of sowing or transplanting, the soil being put in lightly, merely shaking the pot on the bench, and not pressing it with the hands, as the Beans prefer a loose soil through which the water will percolate freely. Enough seed should be put into each pot to allow for a few failures and to make sure of at least five good plants. The pots may be placed on the hot-water-pipes in a forcing-house to hasten germination, and when the plants show the third leaf they may be filled up with soil and a few twigs of Birch be stuck amongst the plants to support them. If any plants show a disposition to grow too tall the points should be pinched out when the stems have got three joints beyond the seed leaves; but if dwarf compact varieties like Sir J. Paxton and Osborn's Forcing are grown, this stopping of the points will be unnecessary. Canadian Wonder is a good variety but it is more useful at a later period. French Beans when grown in the temperature given above will be ready to gather in about six weeks after sowing, so that by sowing once a fortnight a fourth part of the quantity to be grown a continual supply can be maintained as each lot will last in bearing about that space of time. *W. H. Diers, Kelton Hall, Stamford.*

Advertisers are specially requested to note, that, under no circumstances whatever, can any particular position in the paper be guaranteed for advertisements occupying less space than an entire column.

#### SUBSCRIBERS TO

**THE GARDENERS' CHRONICLE** who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

#### APPOINTMENTS FOR THE ENSUING WEEK.

##### SALES.

TUESDAY,	JAN. 1	Roses, Fruit Trees, Shrubs, Border Plants, and Bulbs, at Stevens' Rooms.
WEDNESDAY,	JAN. 2	Nursery Stock and Greenhouse Plants, from sample, at Protheroe & Morris' Rooms.
THURSDAY,	JAN. 3	10,000 Liliun auratum, Azalea, Camellias, &c., at Protheroe & Morris' Rooms.
FRIDAY,	JAN. 4	10,000 Liliun auratum from Japan, and Other Roots, at Stevens' Rooms.
SATURDAY,	JAN. 5	Dutch Bulbs, at Protheroe & Morris' Rooms.
		Imported Orchids, at Protheroe & Morris' Rooms.
		Roses, Fruit Trees, Shrubs, Border Plants, and Bulbs, at Stevens' Rooms.

The Work of the Year.

IN the press of every day work, where one duty swiftly succeeds to another, and where the work in hand is necessarily mingled with the preparation for that which is to come, one is apt to forget how much has already been done. Reflections of this kind crowd upon us as we scan the proceedings of the year now at its end. No one who will take the trouble to turn over the pages of the horticultural journals for 1888 will deny that it has been for horticulturists a year of great activity and substantial progress. For our own parts (if we may venture for a moment to speak of ourselves), the reduction in price, which was accomplished two years ago, is seen to have been a substantial success, which bids fair to be accentuated as time goes on. As the reduction has been carried out without detracting from the quantity or quality of the material put before the reader, we may fairly congratulate ourselves on the result.

Turning to the Royal Horticultural Society, as the corporate representative of national horticulture, it is evident that the worst has been passed. The ill-starred connection with South Kensington has been abolished, and the Society, with its associated library, has been installed in new and commodious premises. Moreover, thanks to the energy and labour of its Council, it has been freed from debt, new bye-laws have been enacted, and very much done to put the Society in a more satisfactory state, while a very large number of new Fellows has joined the ranks.

That the Drill Hall as a place for the fortnightly meetings should not have met with universal approbation is not to be wondered at, but it was the best that could be done at the moment, and no locality more suitable on the whole has yet presented itself, while the shows themselves have been mostly excellent and varied, the contributions from Kew affording great variety and unwonted interest. The inconveniences of this place of exhibition will, in the coming year, be greatly abated by the holding of various meetings at Chiswick, and by the repetition of a great show in the Temple Gardens. That which was held in that locality this year was very successful in itself, and would have been more so but for the dreadful weather—weather, by the way, which by its continuance in evil doing, proved very prejudicial throughout almost all the year, not only to many of our exhibitions, but, what is of more consequence, to many of our crops, the season having been the worst since the disastrous one of 1879, though fortunately not quite so lamentable in its results.

The great Quinquennial Ghent Show in April was the event of the year as regards horticultural exhibitions. It was fully reported in our columns, and was in all respects an unequivocal success. The Rose shows suffered from the untoward season, and the same may be said of the Chrysanthemum shows, although the success and progress of the National Chrysanthemum Society must be noted as one of the features of the time.

Great attention has been devoted to the subject of the culture of hardy fruit as a partial remedy for agricultural depression. Conferences at St. Albans, the Crystal Palace, Dunkeld, and last, not least, at Chiswick, have undoubtedly given a great impulse to this important matter, and among the results already attained has been the establishment of a horticultural college at Swanley, and the formation of a company for the express purpose of developing this industry. Another company, under the title of the National Fruit Growers' Association, has likewise been formed, for the purpose of fruit farming and other cognate enterprises. Provided due caution be exercised, and exaggerated anticipations be not indulged in, there is no doubt that there is room, even under existing circumstances, for a considerable development of profitable enterprise in this direction, though a perusal of the fruit crop reports published yearly in our columns for the last quarter of a century should tend to modify exaggerated anticipations. Difficulties dependent on land tenure, rates, &c., can doubtless be met, but the conditions of climate are less amenable to human provision. Something may be done, however, even in this direction by the selection of suitable sorts, and by appropriate cultivation.

The promised establishment of a Board of Agriculture, to include horticulture and forestry, has for the present been postponed, though there is little doubt that it will ultimately be established when the thorny questions relating to the occupancy of the land, the questions of tithes, preferential railway charges and similar matters may stand a chance of much-required readjustment, though if they are made the war-cries of party politicians it may be feared progress will be slow.

The charitable societies connected with horticulture have prospered, the old established Gardeners' Benevolent Society is thriving, while the enthusiasm which surrounded the inception of the Gardeners' Orphan Fund—a memorial of the Queen's Jubilee—has by no means subsided, and the young institution is already in a prosperous condition and effecting much good.

Public recognition has been made of the importance of horticulture as contributing to the progress and welfare of humanity in the honours accorded to some of its representatives. A special medal was presented by the King of the Belgians, at the instigation of the Ghent Society of Botany and Agriculture, to Professor REICHENBACH for his life-long services to Orchidology; and other distinguished honours have been conferred upon English representative men.

Of new introductions in the way of plants and vegetables we shall make further note on another occasion; in the meantime, we may state that the vegetable first figured in this country in our number for January 7, 1888, p. 13, bids fair to achieve considerable popularity. Under these circumstances a popular name becomes a desideratum. The French term *Croenes* is hardly acceptable, the epithet "Chinese Artichoke" is doubly incorrect. To meet this difficulty Messrs. STUART & MEIN propose to call it Knot-root, to which no very grave objection can be raised, though if we were inclined to be hypercritical we should certainly not call it a root, while Mr. SHIRLEY HIBBERD's proposed term of Spirals is hardly more appropriate. In the meantime, Stachys is not a very objectionable word to employ.

Of books and memoirs relating to botany and gardening there has been a constant stream, as one may see by merely consulting our index. Advertising to forestry, we may permit ourselves to refer to the paper of Dr. SCHLICH in our columns on Abies Douglasii as a timber tree, not only for its direct value as a contribution to the history of the tree but as a model of the kind of investigation which it behoves foresters to undertake, if they would see their art progress and develop its potential importance. Mr. HARRY VEITCH's paper in the *Journal of the Linnean Society* on the fertilisation of Cattleya may be cited as another illustration of the kind of work needed to forward the progress of horticulture in that direction. The vast *Encyclopædia Britannica* has been completed within the year, and we allude to it here for the purpose of pointing out that not only pure Botany and Physiology, but Horticulture and Agriculture are treated in it in a manner commensurate with their importance, and in such a way as to be available, not only for experts, but for the general public.

The obituary record of the year shows that it was disastrous for botanists. The great and much beloved ASA GRAY was taken from us early in the year, the eminent anatomist and mycologist, DE BARY, succumbed to the general fate. Professor DICKSON and Dr. BOSWELL made great gaps in the ranks; while among horticulturists the brave veteran ex-Curator of Kew, JOHN SMITH, was very shortly followed to the grave by his successor of the same name. JOHN DAY will be long remembered among orchidists, while WOODBRIDGE and ROGER will remain in recollection as representative gardeners.

We must confine ourselves here to this general review of the year's proceedings. In successive issues we shall have occasion to enter into further details on particular departments than it is advisable to do now.

#### SYMPHYANDRA HOFFMANNI, SP. NOV. (fig. 107).

—A fine specimen of this remarkable hardy plant, probably the first flowered in this country, was exhibited from the Royal Gardens, Kew, at the Drill Hall last summer, and although somewhat resembling the better known *S. pendula*, it has a more robust habit, and produces flowers in much greater quantity. It is a native of Bosnia, where it was found in 1883 by the gentleman whose name it bears, and was figured and

described by PANTOZEK in the *Wiener Illustrirte Garten Zeitung*, 1884, p. 352, fig. 53. The plant is bushy, high branched, and compact, upright, and from 1-2 feet high. The flowers, on longish pedicels, are produced from the axils of all but the lowest leaves, continuing to give a succession from two to three months in duration. Flowers white, the inside covered with long whitish hairs, the lobes ovate acute, always drooping. Calyx of five long lanceolate divisions, exceeding the base of the corolla by the length of the capsule, style the same length as the corolla, the anthers in a column

**ROYAL HORTICULTURAL SOCIETY.**—The following list shows the dates and places of meetings and shows for 1889:—January 15, February 12, March 12\* and 26\*, April 9\* and 23\*, and May 14\*, at the Drill Hall, Westminster; May 30 and 31, Temple Gardens, London; June 11\* and 25\*, Drill Hall; July 2, 3, 9, Chiswick; July 23\*, August 13\* and 27, and September 17, Drill Hall; September 24, 25, 26, Chiswick; October 8\* and 22\*, Drill Hall; November 12 and 13, Chiswick; December 10, Drill Hall. On the days marked \* a short popular lecture will be delivered at 3 P.M. The Fruit and Floral

25, 26, Chiswick. Chrysanthemum Centenary Conference, November 12, 13, Chiswick.

**CHISWICK HORTICULTURAL SOCIETY.**—We learn that this Society has determined to hold its summer show on July 9 at the Royal Horticultural Society's Gardens, Turnham Green, in conjunction with the meeting of the Floral Committee of the Royal Horticultural Society. This is an excellent arrangement, and one that we hope may pave the way for that fuller federation and affiliation of the special and local societies which would replace so

FIG. 107.—*SYMPHYANDRA HOFFMANNI*: FLOWERS WHITE. (SEE P. 760.)

reaching half the length of the latter; leaves ovate, acuminate, sharply bi- or tri-serrate, the ribs white, prominent on both sides, and these as well as the whole plant covered with short hairs, and of a fresh spring green colour. Although the flowers are not of a brilliant colour, the neat habit of this plant, together with its profuseness of flowering, entitle it to a place in every good collection. It is extremely free even for a *Campanula*, and continues such a long time in bloom as to make it welcome. So far our impression that it is a biennial has not been confirmed. It commenced to flower in July, and is still alive, and flowering at the present moment—December, 1888.

Committees will meet on the above dates at 11 A.M., except May 31, July 3, September 25, 26, and November 13. The Scientific Committee will meet at 1 P.M. in the Library, 111, Victoria Street, S.W., on the above dates except on May 30, 31, July 2, 3, 9, August 13, 27, September 17, 24, 25, 26, November 12, 13. The Annual General Meeting will be held in the Library, on February 12, at 3 P.M. National Auricula Society's Show, April 23 Drill Hall. Great Summer Exhibition, May 30 and 31, Temple Gardens, E.C. Great National Rose Conference, July 2 and 3, Chiswick. Chiswick Flower Show, July 9, Chiswick. National Carnation Society's Show, July 23, Drill Hall. Great Vegetable Conference, September 24,

advantageously the destructive process of disintegration which has been going on in other quarters. The autumn show of the above Society will be held on November 14.

**"THE GARDEN ORACLE."**—Mr. SHIRLEY HIBBERD issues his customary annual, containing, in addition to the ordinary calendrical matter, lists of the new plants of the year, much useful Chrysanthemum lore, and a variety of matter which will make its purchase a matter of satisfaction. The publishing office is at 4, Ave Maria Lane.

**"THE GARDENER'S MAGAZINE."**—At this season our old friend blossoms out like the Glas-

tonbury Thorn, throws off the details of weekly routine, and diverges into numerous byepaths. The holiday-keeping reader will delight to have a "run round" Shakespeare's gardens. Some may find leisure to overhaul and re-arrange their bookshelves, and will find useful hints. In fact, the reader must be very teratological indeed if he cannot find something to amuse and interest him.

**ALMANACS FOR 1889.**—Foremost among these for general use stands Whitaker's (12, Warwick Lane, Paternoster Row, London), of which we have received a copy. The latest edition is larger than that of 1888 by about 60 pages and contains as usual a fund of statistical information on a variety of subjects, political and otherwise, making it a handy reference book for both office and home. There is a review of the science of the year, music, &c., and a table of marks on porcelain is introduced. The *Live Stock Journal Almanac* (Vinton & Co., 9, New Bridge Street, Ludgate Circus, London), contains numerous articles of use to the stock-farmer, contributed by some of the leading writers on the subjects, such as Sir J. B. Lawes, and Professor Wrightson. Horses, cattle, poultry, are all mentioned. *Calvert's Mechanic's Almanac*, a book of about sixty pages, contains articles which recommend themselves to builders and other artisans. There are short paragraphs on various topics of interest, a notice on the patent law amendment, and tables for purposes of various calculations. Messrs. Foster & Pearson (horticultural builders, &c., Beeston, Notts) issue an almanac with one month on a sheet; and a daily calendar, comes from Messrs. T. Fletcher & Co. (Gas Stoves, &c.), London and Warrington. Messrs. J. Weeks & Co. (Horticultural Builders), Chelsea, London, issue a handy pocket and note-book for the year. The Lion Fire Insurance Company has also forwarded a Card Calendar for 1889.

**"WALKS IN HOLLAND"**—Many of our readers, interested in Dutch bulbs, Crocuses, &c., will like to know that an illustrated Handbook to some of the less frequented parts of Holland, including Friesland, Groningen, and Guelderland, edited by Mr. PERCY LINDLEY, is in preparation.

**SCIADIUM ARBUSCULA.**—At a well attended meeting of the Natural History Society of Aberdeen on Tuesday, the 18th inst. Mr. JOHN ROY, President of the Society, communicated the occurrence of the *Sciadium arbuscula* (BRAUN), discovered for the first time in the British Isles, in the month of November last, by Mr. ROY. The finding of the plant is somewhat interesting. Mrs. FARQUHARSON, of Haughton, forwarded to Mr. ROY a specimen, with other plants she had found growing amongst leaves in a pool near Haughton, Aberdeenshire, and that gentleman was enabled, from descriptions given by Dr. BRAUN, to make the plant out to be the *Sciadium arbuscula*, which is found in Germany and other parts of the Continent. In his communication on the plant to the Society Mr. ROY described its growth in its various stages, and illustrated his remarks by drawings executed by Dr. BRAUN.

**CHINESE FLORA.**—The enumeration of the plants known to inhabit the Chinese Empire, and which is being prepared by Messrs. F. B. FORBES and W. B. HEMSLEY, has now reached the end of Composite. The enumeration forms a volume of the *Journal of the Linnean Society*, but may be had separately. Descriptions are given of new species, while, for those which have been previously described, bibliographical references are supplied. The work will form a necessary companion to the *Flora of British India*, and other Colonial Floras.

**COCOA-NUT REFUSE.**—An interesting possible utilization of Cocoa-nut refuse is referred to in a report of the Government Botanist of the Botanic Gardens in the Nilghiris for the year 1887-8. It has been found that if the refuse be subjected to pressure while yet moist, the natural viscosity causes it to cohere to form a mass resembling millboard.

This substance is so hygroscopic that if a puncture be made in it while in contact with water the adjacent parts immediately absorb so much water that the orifice is closed by the consequent expansion. It has been found that in this way the orifice caused by the firing of a bullet nearly an inch in diameter through a  $\frac{3}{4}$ -inch plate of the refuse, sustaining a head of 1 foot of water, was stopped so quickly, that although a large jet at first spirted through, this decreased in volume in a few seconds, and in less than a minute had ceased entirely. It is suggested that this property might render the material valuable as a backing to the armour of ships.

**STOCK-TAKING: NOVEMBER.**—The imports from British possessions and foreign countries at this season of the year are of somewhat greater interest to both vendor and purchaser than, perhaps, they are at any other time—medical gentlemen may also be expected to be taken into consultation in this connection. That will be seen later on. The summary for the month of November, now before us, records as follows:—

	1887.	1888.	Difference.
	£.	£.	£.
Total value of imports	32,850,321	35,223,935	+2,373,614
§ II.—(A.) Articles of food and drink—			
duty free ... ..	10,114,928	11,253,883	+1,138,955
(B.)—do., dutiable	2,639,453	2,537,472	—101,981
§ VI.—Raw materials for textile manufactures (including Flax, Hemp, and Jute), ... ..	8,630,406	8,468,482	—161,924
§ VII.—Raw materials for sundry industries and manufactures (including wood and timber, hewn, sawn, split, dressed; vegetable materials; for paper-making, &c.)	2,831,606	3,428,423	+596,817
§ IX.—Miscellaneous articles (including Clover, Grass, Flax, Rape, Linseed) ...	1,272,667	1,508,562	+235,895

From the expanded list of imports the few appended extracts are of interest—the "summary" is otherwise sufficiently explicit:—

	1887.	1888.	Difference
§ II. Fruit:—			
Apples, raw ... .. bush.	389,054	942,466	+553,412
Unenumerated, raw ... ..	206,513	182,410	—24,103
Onions ... ..	527,931	339,216	—188,715
Potatoes ... .. cwt.	178,143	63,800	—114,343
Vegetables, raw, unenumerated ... ..	£34,987	£12,365	—£22,622

The "difference" columns in both tables will be found of interest to a large section of our readers; for whom, however, the figures for the twelvemonths will naturally be more valuable; and this will be laid before them in good time.

**BIRMINGHAM AND MIDLAND COUNTIES CHRYSANTHEMUM AND HORTICULTURAL SOCIETY.**—The annual dinner of the above Society was held on Tuesday evening, December 18, at the Bell Hotel, upwards of fifty members, leading nurserymen and seedsmen and principal gardeners of the district, being present, besides several invited guests, and amongst the latter were Mr. OUTRAM, Mr. PETCH, and Mr. PARKER, Impney Hall, the successful Chrysanthemum grower. The chair was taken by Mr. LATHAM, Curator of the Botanical Garden, and after the usual local toasts had been given and duly responded to, Mr. OUTRAM proposed the toast, "The Society," and alluded to the good work the Society was doing, the excellent manner in which everything was arranged, and to the quality of the exhibits. Mr. HUGHES, the Secretary, announced that it was intended to offer a substantial prize for cut flowers of Chrysanthemums next season, it being the centenary of the introduction of the plant. A subscription list was at once opened and a good sum collected in the room. It is the wish of the Society to draw

together the leading growers of the North and the South to compete for this prize, and they intend to make it worthy of their object.

**PRIMULA VEITCH'S CHELSEA BLUE.**—A batch of this handsome blue *Primula* is just now in bloom in the fine gardens of H. H. GIBBS, Esq., Aldenham, Elstree, and is spoken very highly of by Mr. E. BECKETT as a variety whose colour is very useful and telling in floral arrangements. The *Chrysanthemums* have been very fine at Aldenham this year, and the successions of *Primulas*, *Bouvardias*, *Poinsettias*, &c., with good foliage plants, and a sprinkling of *Orchids* ensure no lack of bloom at this season.

**EUCHARIS AMAZONICA.**—Almost filling the space in the Banana-house not occupied by the *Musas* now fruiting at Aldenham in the gardens of H. H. GIBBS, Esq., is a grand lot of specimens of this fine white bulbous plant, many in flower and in great promise of bloom to succeed for a considerable time. These plants are noteworthy, especially as many of them were suffering from *Eucharis-mite* when they came into Mr. BECKETT's care. Mr. BECKETT's opinion is that had condition, either from bad culture or accident, favours the increase of the *Eucharis-mite*, and good culture soon stamps it out; once good root-action being secured, the mite soon departs to more congenial localities. This is the opinion of many good growers now.

**FRUIT FARMING.**—MR. P. CONWAY, late of the Gardens, Muntham Court, Worthing, is now engaged in planting a fruit farm on an extensive scale at Outwell, Wisbech, Cambs., for J. W. MARTIN, Esq. The farm will embrace both indoor and outdoor fruits.

## SOCIETIES.

### LINNEAN.

DECEMBER 20.—MR. W. CARRUTHERS, F.R.S., President, in the chair. The Rev. G. E. Post, M.A., M.D., was elected a Fellow of the Society. The following recently elected Fellows were formally admitted:—MR. R. W. HULLETT, M.A.; DR. D. T. PLAYFAIR, Mr. Clement Reid.

Professor R. J. Anderson exhibited a photograph of an apparatus for the microscope which he had designed, consisting of a revolving disc with clips, by means of which a number of slides may be successively brought opposite the microscope, which is fixed in a horizontal position in front of it. Mr. Clement Reid exhibited fruit of the *Hornbeam* from the preglacial forest bed at Pakefield, near Norwich, and not previously recorded as occurring in any British deposit.

Mr. T. Christy exhibited a collection received from Java of hairs from the base of various Ferns, notably *Cibotium Cummingii*, and a species, as supposed, of *Dicksonia*, used as a styptic, for staunching blood. Professor Stuart, in pointing out that the use of similar material for a like purpose in China was well known to surgeons, took occasion to explain the nature of the so-called "lamb of Tartary," on which an instructive little volume had been published by the late Mr. Henry Lee, F.R.S. Mr. D. Morris remarked that the use of Fern-hairs was also known as a styptic in South America, whence specimens had been forwarded to the museum at Kew.

A paper was then read by Mr. D. Morris on the characteristics of plants, included under *Erythroxylon coca*, Lamarck, with a description of a new variety, which he proposed to name, from its origin, *E. novogratense*. He pointed out that the well-known *coca* plant had been noticed by botanists and travellers for the last 300 years, and that although *Clusius* was generally regarded as the earliest writer on it, he had been anticipated by Nicholas Monardes in his *Historia Medicinal*, published at Seville in 1580, and translated by *Clusius*, who printed it in a condensed form in his *Exoticum libri decem*, in 1605. The plant was first described as a species by Lamarck, in the *Encyclopédie Méthodique*, in 1786, from specimens brought by De Jussieu from Peru. Until lately the leaves had been used merely as a nervous stimulant, like opium in China, and betel in the East Indies; but had latterly come into prominence as the source of cocaine, a valuable alkaloid possessing anæsthetic properties when brought in contact with the mucous membrane. There were several climatic forms more or less distinct, and after describing the typical plant, Mr.

Morris pointed out the characters by which *E. novagranatense* might be distinguished.

Mr. Spencer Moore contributed a paper on Apioscystis, which he regarded as a Volvocina. The ciliated form was described, and it was shown that its zoospores may sometimes escape as cœnobia, like a degenerate Volvocina, which has exchanged the motile for the fixed condition; the sexual cells being zoogametes, its affinity is rather with Pandorina than with oogamous Volvocæ. The paper was criticised by Mr. A. W. Bennett and Professor Marshall Ward, who, while testifying to the importance of the investigation, expressed the hope that no change would be made in classification until further examination had been made of some of the stages at a critical period of development. Mr. George Murray gave his warm support to the views expressed by Mr. Moore.

A paper was then read by Mr. G. B. Sowerby embodying descriptions of some new species of shells, of which coloured drawings were exhibited. Amongst these the most noticeable were an Ortholus from the Peruvian Andes, *Pleurotoma* (Hong Kong), *Amathina* (Mauritius), *Crassatella* (Japan), *Clavigella* (Mauritius), and *Pectunculus* (Australia). An interesting discussion followed, in which Professor Stewart and Professor Mivart took part, upon the colouration of mollusca being possibly dependent upon the colour of their natural surroundings, or upon that of the host to which in many instances they were found to be attached.

The meeting adjourned until January 17.

## ENTOMOLOGY.

### THE RED GRUB OF THE PLUM.

In our article on the Tortrix Wuberiana (*Gardeners' Chronicle*, September 6, 1884) we detailed the life-history of a small moth which lays its eggs on the trunks or branches of Pear trees, the caterpillars hatched from which burrow beneath the bark, forming passages, which, when numerous, injure the tree, especially killing the smaller branches, and by degrees destroying the trees. This insect does not, however, confine itself to the Pear, but may be found on some of our stone-fruit trees, such as the Peach, Apricot, and Plum. In England, however, and in various other parts of Europe, more serious injury is sustained by the crop of fruit of the last-named tree in the shape of a small dirty red-coloured caterpillar, which is often found in the interior of the full-grown Plum or Green Gage, towards the end of the month of August.

The eggs are laid by the parent moth in the early part of June upon the then formed young fruit, the grubs hatched from which, in the following month, at once burrow into the fruit, upon the flesh of which they subsist, feeding around the hard stone, and leaving their small particles of excrement within the wounds of the fruit, since, being protected from rain and wind, they thrive rapidly, the outer wound in the skin of the fruit through which they gained an entrance soon healing up, and preventing their presence within from being suspected; so that it often happens that the unwary fruit-eater has his mouth filled with the nauseous interior of the fruit. The state of the interior of a Green Gage is shown in the accompanying woodcut (fig. 108), made from a drawing on August 23 last, the stone of the fruit with the grub of the natural size, and the mass of the insects' excrement being represented of the natural size. The head of the grub is black, the following segment of the body is pale flesh-coloured, with two small black dots near the hind margin, with black markings at the sides, and the remainder of the body is red, the hind part darker coloured, and there are a few short fine hairs scattered over the body.

The fruit falls to the ground, and the grub immediately creeps out of it, and seeks for a quiet place in which it can pass its chrysalis state: generally, however, this is effected whilst the fruit still hangs on the bough, when it creeps out and enters any crevice formed by loose or splintered pieces of the bark and wood, penetrating as deeply

as possible into the chink of the former, where it spins a fine light silken cocoon, in which it assumes the chrysalis state, the moth appearing in the following spring.

The moth is the Tortrix (*Opadia*) *funebrana* of Treitschke, but it was subsequently described under the name of Tortrix (*Carpocapsa*) *nigricana* by Schmidtberger, being, however, quite distinct from the true Tortrix *nigricana* which infests the common Pea (see *Gardeners' Chronicle*, 1880, p. 360).

The moth (as shown by the cross lines in our figure) measures nearly two-thirds of an inch in the expansion of the forewings, which are of a dark colour varied with lighter scales, forming shades before and beyond the middle, and with several short oblique dark lines along the fore edge of the wing; the hind wings are paler, with a dark border. The insect is represented about twice the natural size in our engraving, which also represents the caterpillar of the natural size suspended by a thread from a twig, with the head and two following segments of the body.

It has been suggested that it is desirable to effect

FIG. 108.—PLUM GRUB AND MOTH (TORTRIX FUNEBRANA).

the destruction of this insect by shaking the trees, so as to cause the injured fruit, which has become prematurely ripe from the attacks of the insect, to fall to the ground, or which has already fallen, and which must be at once destroyed; all loose portions of the bark of the trees should also be scraped off and burnt, so as to destroy such of the insects as have already made their cocoons there.

We learn from our American correspondents that the Plum Crop in the United States is very precarious, but we find no notice in Mr. Sander's fine work on *Insects Injurious to Fruits* (Philadelphia, 1883), of any Tortrix injurious to the different kinds of Plums. There is, however, in that country another insect which is even more injurious than our English moth, namely the Plum Curculio (*Conotrachelus nenuphar* Herbst), "the greatest enemy the Plum has to contend with, for when allowed to pursue its course unchecked, it often destroys the entire crop." This is a small weevil, the tiny grub or larva of which feeds around the stone of the fruit in the same manner as the larva of our Tortrix, and measures when full grown about two-fifths of an inch long, and which undergoes its transformation much in the same way as our Tortrix. *I. O. W.*

## IRELAND.

### ROYAL BOTANIC GARDENS, GLASNEVIN.

The following extracts are taken from the annual report of the Director of the Science and Art Museum, Dublin:—

Year by year it has been my pleasing duty to draw attention to the progress and improvement in these gardens. In a better climate and with a more fertile soil mere conservation might do much to render a similar place attractive at all times, but, circumstanced as they are, it requires both energy and forethought to provide for all the contingencies arising in consequence of uncertain and variable seasons and a poor soil. While the public enjoy and appreciate the results, it seems only just that particular mention should be made here of the means by which these results are obtained. It is too often the case that with a limited staff an excuse is made for leaving something undone because something else has to be done; such excuses are not and need not be made by Mr. Moore, for the simple reason that everything is provided for and done in advance of the pressure, which it is not unanticipated before it has actually come to pass.

It is most satisfactory to note the testimony given by Mr. Moore as to the success of the new Palm-house, and indeed the health and vigour of the plants since its completion cannot fail to impress every visitor. So far as any opinion can at present be formed, the new Fern-house promises to be equally successful, and the arrangement by which different temperatures are maintained in its two divisions to suit the necessities of the two classes of Ferns which they contain respectively, appears to work well.

The new ground known as the Arboretum is rapidly emerging from the raw appearance which it at first presented, and there is every prospect of its being fully stocked within a reasonable period.

The gardens have been largely used by students and their teachers, and the supply of plants to various educational institutions has not only been continued, but Mr. Moore has found it practicable to distribute hardy plants to the Queen's College, Cork, and to the garden attached to the Royal University, while a collection of Cape bulbs has been sent to the Sydney Botanic Gardens.

Upwards of 1000 plants were received either in exchange or through the munificence of donors, among whom Mr. Moore especially mentions the Director of the Royal Gardens, Kew, and Messrs. J. Veitch & Sons, of Chelsea, to whom, as well as to about eighty other donors from all quarters of the globe, the thanks of the Department have been duly communicated.

The purchase of plants and seeds during the past year to a small extent exceeded, both in number and cost, the amounts returned for last year. In round numbers, the cost has been £272 for 945 plants, as against £265 for 834 plants purchased in 1886. When the results are taken into consideration, this expenditure cannot but be regarded as moderate.

The erection of a new house for succulent plants and the increased accommodation in connection with the office and library remain as the two principal requirements for which it is hoped provision will be made in the coming year.

Although there is a falling off in the attendance of the public compared with last year, the total number of persons who entered the gardens is scarcely short of what may be almost regarded as the present normal average of 1000 for every day in the year.

Mr. Moore in an appendix, reports as follows:—*Conservatories*.—No. 1. In my reports for 1885 and 1886 I drew attention to the dilapidated condition of No. 1 conservatory, and in my report for the latter year I further mentioned that designs for a house to replace it had been prepared. It is now my pleasing duty to report that these designs were adopted, and the erection of a new house sanctioned, which is now completed and fully occupied. The new conservatory is an

elegant and commodious building, the main portion being square (32 feet 6 inches), with straight sides 23 feet high, and a curved roof, the upright portion being constructed of wood and the roof of iron; leading to the main portion is a spacious porch, 19 feet long, 21 feet 6 inches wide, and 17 feet high, and a passage connects the new house with the Victoria-house No. 2. The entire house is furnished with slate and iron shelving, concrete floors, and provided with ample heating appliances. Arrangements were made by which the porch can be heated separately from the main building; it is therefore used for the cultivation of tropical Ferns, whilst in the other portion the cool and temperate temperature-loving Ferns are collected together. It would be injudicious so soon to pronounce an opinion as to whether or not the new conservatory suits the cultural requirements of plants.

No. 6. The Orchid-house is now in every respect a greatly improved house in comparison with what it was at the date of my last report, in which I described the very decayed condition of the roof. Messrs. Boyd were directed to put a new roof to the Orchid-house, and arrangements were made to allow them to commence work in September. As was the case with the Ferns in No. 1 conservatory, all the Orchids had to be removed and accommodation found for them elsewhere. The new roof is an excellent one in every respect, being light and strong, and containing all modern improvements, such as grooved sash-bars to carry away condensed moisture, the benefit of which is already apparent. The arrangements for ventilation are also good. Clear glass has been substituted for rough grooved glass with which the roof was formerly glazed, so that much more light is admitted to the plants—an important factor in the successful cultivation of Orchids. Advantage was taken of the opportunity afforded by the constructing of the new roof, to extend each side 7 inches outwards, so that a substantial addition of 14 inches has been gained in the breadth of the Orchid-house. When closely examined the side staging was found to be too old for repairs, and it has, therefore, been replaced by a neat and substantial slate and iron staging.

The Orchid-house is now thoroughly sound, and may be regarded as one of the best and most suitable conservatories in the garden. I feel bound to testify to the excellent and expeditious manner in which all the work undertaken by Messrs. Boyd in this garden has been performed.

No. 7. The more experience I have of the large Palm-house, the more I can praise it as an excellent house for the cultivation of plants. The rapid growth and excellent health of the plants in it bear ample testimony to its suitability to their requirements. They are growing so rapidly that they will soon be overcrowded, and some of the duplicates must be eliminated.

*Library and Herbarium.*—I can only repeat with emphasis the appeal made in former reports for increased accommodation in this department. A large number of valuable books was lately purchased for the library. The collection is a very valuable one, and well merits a more suitable location.

*Outdoor Department.*—Several causes combined to render it impossible to do much new work in the outdoor department during the past year, the chief cause being the extreme dryness of the season. Such a long continued drought has rarely been experienced at Glasnevin as that which prevailed during the spring and summer months of 1887. The result was disastrous to newly moved plants and to herbaceous plants in general. On the shallow gravelly soil of Glasnevin, moisture quickly disappeared, and although several men were constantly employed watering them, herbaceous plants only attained to about one-half their normal development, and many of them did not flower. Several large trees throughout the garden died, and it was only by constant watering that newly planted trees were kept alive. The usual indoor staff were unable to perform their ordinary daily work, owing to the numerous movements of plants from house to house, rendered

necessary by rebuilding and repairs, so men had to be transferred from the outdoor department.

Considerable changes were made in the walks and grounds adjacent to the new Fern House. The main walk leading from the entrance gate, was altered, widened, and re-made. The shrubberies at the gate, which had become poor and overgrown were reformed, and the herbaceous border in front of the new house was re-made; all the plants in it being lifted, the ground well trenched and manured, the former occupants being then re-planted, and many additions made to them.

The Rose garden also received attention. Many kinds of Rose had died out, and the soil in the beds was exhausted. All the plants were regrouped and classified, the old plants replaced by a fresh stock, and the beds renewed.

The process of removing ivy from some of the large specimen trees throughout the garden was continued, but much more remains to be done, as owing to the matted growth of the ivy stems, this work occupies much time. Those trees from which the ivy was removed last year are already much improved in vigour and appearance.

## SPECIMEN TREES IN KEW GARDENS.

*PINUS COULTERI.*—Some time since we published a description, accompanied with figures, of the magnificent cones of *Pinus Coulteri* (see p. 413, March 28, 1885), as produced in Mr. Baker's pinetum at Bayfordbury. In that article we had occasion to advert to the fine specimen of this tree at Kew, and which from its regularly pyramidal habit and imposing proportions never fails to attract the attention of tree lovers. We have now an opportunity of giving an illustration (fig. 109), and we are indebted to Mr. Geo. Nicholson for the following measurements of the tree in question:—Height, 56 feet; spread of branches, 45 feet; girth of stem at 4 feet, 6 feet 2 inches. The growth of the tree is relatively rapid, so that its value to the landscape gardener may readily be estimated. Mr. George Paul tells us the tree does well on London clay. We can answer for it on a chalky loam, for some of the finest cones we have seen were grown on a tree in the pinetum of Mr. Thomson, of Petham, near Canterbury.

## THE BULB GARDEN.

### TIGRIDIA PAVONIA.

CONSIDERING the great beauty of this highly coloured Iridaceous plant, the wonder is that it is not more grown in gardens, as it is so gorgeous and large in flower as to attract notice and command admiration from even the most casual observer, and those not acquainted with it are sure to ask what it is. Unfortunately the gay blossoms last only a day, but as they are produced so freely and in such rapid succession plants are seldom without one or more open for several weeks. The past season, however, was against them, the wet and cold having been too much for such heat-loving subjects, and in consequence many failed, and in some cases the bulbs died outright. The finest form of this *Tigridia* is the variety named *grandiflora*, and besides the type there are several that have originated from seed, the best among them being *T. splendens*, *T. Wheeleri*, and *T. speciosa*; but any and all of them are well worth growing. They take up but little room, as they may be planted among Tulips or Roses or other tall things, and the slight shade they get in such positions just suits their requirements. In some places where the soil is very light and naturally well drained, *Tigridia pavonia* will live out during the winter, but unless the situation is specially favoured in the way referred to, the bulbs should be taken up when the tops die away, and be stored in some dry shed till the spring. The right time to plant is early in April, when, if placed in

borders, they look best in clumps or patches of three or so, and should be dibbled in about 3 inches deep, and have a little silver-sand dropped into the holes to cover them up. *Tigridias* admit of ready propagation by offsets and seed, which they produce freely, and the latter should be sown in pans of fine soil in March, and if then placed in gentle heat the seedlings will soon be up, when, large enough, may be pricked out in a bed and left to grow for the summer, but it will take about three years' growth before the bulbs will be large enough to produce any flowers. *J. S.*

### LILIUM CANDIDUM FOR FORCING.

Although replete with all that is lovely, the genus *Lilium* cannot boast of containing many species which can endure even a moderate amount of artificial heat with impunity, and fewer still are those kinds to which the term forcing as usually understood may be applied; indeed, none of the species are benefited by anything beyond a greenhouse temperature at any time, that is, if you place value on the future bulb; if not—and the only thing needed is to have their flowers at all hazards—then it matters little how much or little heat be given them so long as the flowers are forthcoming when required; but it is not many who would care to risk their stock in this way, or who could even afford to be so extravagant. Taking all things into consideration, the old white garden Lily, *L. candidum*, is, without doubt, the most valuable for the above purpose, not merely because of the glistening purity of its flowers, or its fragrance, but because these two primary qualities are combined with unparalleled cheapness; and, seeing that it does not object to gentle heat; it may with fair treatment be made a profitable investment where flowers are grown in quantity either for market or home use.

Many growers of this Lily during the early part of the present year suffered considerably from the disease, and the crop was destroyed wholesale,—in one particular instance which came under my notice the average of good flowers hardly equalled the number of spikes pro-duced, and to record this fact of some hundreds of plants means a serious loss in many ways besides their flowers, such as time, fring, house-room, and the like; nor did these bulbs look any too promising when I saw them, a few days ago, though they may pull through in many instances if allowed to start their flowering stems naturally. It may be, however, that no new flowering bulb was built up, after so severe an attack of disease; and, therefore, it will be looked for in vain. One of the best and surest signs of good health in this species is the production of radical leaves early in autumn; if these appear, and provided the bulbs are of sufficient size, you may rely upon flowers in due course, and even in small bulbs it is an excellent sign of good health to see these push forth at the right time. Those bulbs which were forced early last spring, and escaped the disease are now pushing up good flowering stems again, fully 8 or 10 inches high; all these, however, produced their radical leaves in the usual course. Those who would grow this Lily for forcing may regard this as the best possible proof of healthy root-action below, and this species with its varieties are wholly dependent on basal roots for support; for I have never seen stem roots upon this species at all. But radical leaves have been somewhat sparsely produced this autumn, at least from plants in the open ground, and particularly is this true of those attacked by the disease in early summer. These remarks, I may observe, have special reference to such as have been grown for forcing previously, for there is a distinction—a wide one, too—between established pots of this Lily and newly imported ones. It is a great rarity for the latter to produce radical leaves at all the first year but, if the bulbs are strong, they will push forth their flower-stems direct from the bulb. These remarks may or may not be of much importance to those who desire to force this Lily in the future, but they are at any rate the result of observation, and may

perhaps suggest something of greater importance than what is here conveyed.

In the cultivation of this Lily I am convinced that it should be thoroughly established in pots before being forced at all. To be successful with it you cannot pot it too early in the season, and no better time exists in the year than the very week it completes its flowering. Then, and only then, can you catch it with the least possible loss; then it is that the new main roots begin

my advice is to be satisfied with one crop; it is much more natural, and your stock will increase in value thereby. Attempting two crops will soon cause ruin. Those forced early during 1888, say prior and up to Easter, will flower much earlier in 1889, hence the value of successional batches. Our earliest forced of 1888 are quite two months in advance in pushing up their flower-stems, which is another point of advantage in having them established. They were housed a short time since, and are now in a temperature of

## NOTES FROM DEVONSHIRE GARDENS.

COLHAYES.—This, the seat of R. Levett, Esq., is situate about a mile and a half from Bovey Tracey station, South Devon, and a short walk brings the visitor to the entrance gates. In close proximity to Colhayes stands the Haytor Rock, whence the granite used in the construction of London Bridge was brought. A tramway of cut granite blocks was laid for a distance of 6 miles, and which was in use before locomotive power came into general use. The causeway stones are now being taken up, to be employed in buildings.

The mansion is situated at about a mile from the entrance, an avenue, consisting of fine specimen trees of *Ulmus campestris*, *Æsculus hippocastanum*, and *Fagus sylvatica*, leading up to it. The outlook into the park and pleasure-grounds from the avenue is delightful, for rare skill is exhibited in the planting, and the beautifully undulated surface is rendered still more charming by the rippling stream, which skirts the avenue for its entire length, here roaring over artistically arranged rocks, and again running on peacefully for a short distance. The garden, for flowers of a style now not so much in favour, covers a large area.

On the north side of the mansion is a fine rockery of considerable extent, whose occupants, at the time of my visit, were growing in great luxuriance, a great number being of very large dimensions. I remarked the following species and varieties:—*Lastrea dilatata*, *L. Filix-mas*, *Polystichum aculeatum*, *Polypodium doryopteris*, and *Osmunda regalis*. In the kitchen garden a large range of fruit and plant houses, pits, &c., are erected, the former being three-quarter spans, and the latter span-roofed. The vineries contain Black Hamburg, Muscat of Alexandria, and Muscat Hamburgs are the only varieties grown, and the reputation gained by the Vines whilst under the superintendence of Mr. J. Moore is still maintained by Mr. Underdown, the present gardener. The immense foliage of these Vines had a firm leathery texture, and the fine large bunches spoke well for his skill in viticulture.

A good number of well trained Peach trees are grown, but only three trees were in bearing at the time of my visit (September 20). The past season was very unfavourable for this fruit out-of-doors in Devon, but a fine Barrington trained against a south-west wall was bearing a large crop of fruit of beautiful colour.

Many beautiful plants are grown in the stove, and in first-class condition, their arrangements being of a very pleasing sort. Planted in tubs and trained along the roof were *Allamanda Hendersoni*, *Stephanotis floribunda*, and *Dipladenia amabilis*; it is seldom that the last-named is found so well done as it is here, the plant being covered with bloom in every part, although Mr. Underdown remarked that it was going off.

The cultivation of the tuberous *Begonia* is well carried out, a large house being devoted to them, besides low pits, for the young seedlings, of which a large number is raised every year. Great pains are taken in the crossing of these plants, the best of the plants raised by Laing, Cannell, and J. Veitch & Sons being employed, so that the collection is now by far the best I have seen in any private garden. Every possible shade of colour is found, and the flowers are of large size and much substance. The double flowers predominate, but the single varieties are not neglected, although less numerous than the former.

Of hardy fruit there was a fair crop, and of vegetables great abundance.

PITR HOUSE is in the immediate neighbourhood of Colhayes, and was recently purchased by Mr. Seale Hayne, M.P. for Mid-Devon, from the executors of the late W. R. Pulsford, Esq. Mr. Dawe, the gardener, has been in office for twenty-five years with the previous proprietor, and his services are now retained by the present one. Mr. Dawe, it may be stated, superintended the making of the gardens.

FIG. 100.—PINES COULTERI IN THE ROYAL GARDENS, KEW. (SEE P. 761.)

to emerge from the base of the bulb, and to secure these intact is of the greatest moment. But it is useless talking thus in mid-winter, some may say, with apparent justification, yet there is still a chance left even now; by procuring imported bulbs and potting at once. Do not attempt to force these, just let them flower at will the first season; meanwhile they will be getting well established, and will prove much better for actual forcing another year than freshly potted ones, especially if the latter are home-grown, and not potted at the time I have indicated. It has been suggested that two crops of flowers may be had in one season, but

from 50°–55°. In our case boxes are used instead of pots, these being 14 inches by 18, and about 9 inches deep, capable of taking a dozen good-sized bulbs; in this way a good many may be put into a small space—an item of importance with market growers. Much has yet to be learnt about forcing this Lily for profit; hitherto considerable discouragement has resulted from impatience on the part of the grower, who has hardly realised yet that better results follow when the bulbs have remained undisturbed for a year or two, in the pots or boxes, than is the case when they are forced. It may be too hard, the first season after potting. E. Jenkins.

which are very extensive, his knowledge of landscape gardening standing him in good stead.

INDIO, the seat of Charles Aldenbury Bentinck, Esq., also worthy of mention, has extensive pleasure grounds, ranges of fruit and plant-houses. It is under the charge of Mr. J. H. Hambly, a competent gardener. *W. H. A.*

## FIGS IN THE OPEN AIR.

A PARAGRAPH in your issue for September 22, p. 331, referring to the climate of Rothsay, and to some excellent Figs grown in the open air at that place, was interesting for the reason that many persons are under the impression that to attempt to grow Figs in the open air north of London is almost futile; such, however, is not the case, for although I am aware that many fail in the undertaking, and that a good number of places are unsuitable for the growth of the Fig, I could point out places a good distance north of London where, in an average season, Figs thrive admirably, and good crops are ripened in the open air. Some of the finest Figs I ever saw were grown on a south wall at Howick Hall, in Northumberland, where, possibly, one of the finest and most historical Fig trees in the country may be seen. It is, I believe, mentioned in *Thompson's Gardeners' Assistant*. When last I saw it, about a twelvemonth ago, it was a model of health, and bearing an excellent crop of fine fruit, just on the point of ripening. No protection during the winter is now, I believe, given—in fact, I know that during the severe winters of 1885-6 and 1886-7 no protection whatever was given; although I think I am right in saying that slight protection in the shape of Fir and Yew branches was given in former years, but it was found of no great advantage; in fact, practically speaking, it was labour in vain, for equally good crops could be grown when the tree was allowed to take its chance during winter as when smothered up with branches. No special attention was paid to it beyond the usual training and tying in of the branches, although it is only fair to admit that the wall on which the tree is growing was flued, which undoubtedly would have a tendency to assist the ripening of the fruit. No fire-heat, however, was given, unless in very dull and wet seasons, and then only from the end of August until the fruit was ripened. The variety is the Brown Turkey, which is one of the best for open-air culture, and in this case the fruit was of excellent flavour and of a large size, many being upwards of 4 inches in length. Usually Mr. Inglis, the gardener, gathers the fruit and places them on the shelf of a vinery for a day or so, which helps to bring up their flavour greatly. Although liberally treated the tree referred to does not by any means make gross succulent growth, but short sturdy wood so essential in open-air Fig culture. This, undoubtedly, is the secret of success, and to attain that end no pains should be spared. Too frequently Figs are planted in rich soil, which induces them to make gross growths of a succulent nature; consequently when the winter comes, even if protected, the fruit for the coming year's crop is injured, and oftentimes the wood itself killed.

Again, trees growing in the open are sometimes neglected as regards pinching the points of the shoots and thinning the branches, and when such is the case success cannot be expected. No fruiting shoots should have their points pinched nor should they be fastened closely to the walls, but allowed to spring away slightly. Many growers make a great mistake here in tying in the points closely, by which a vast quantity of fruit is injured. In southern counties, of course, bushes and standards may, and frequently are grown, though those contemplating outdoor Fig culture cannot do better than to direct their attention to wall trees only. C. C. [The Fig tree spoken of here owes its fruitfulness, doubtless, to age, as we know that the weaker growth due to age favours a constant fruiting habit. This tree measured 45 feet in breadth, and 12 feet in height, = 540 square feet, forty years ago, and was then an excellent grower, but it was occasionally found necessary to partially ring the main branches to check grossness in the shoots. It has been known

to bring to maturity 600 fruits in one year, which, had they been all sold, would have fetched in Newcastle-on-Tyne, at the then price of 6s. per dozen—£15. Ed.]

## HOME CORRESPONDENCE.

RHODODENDRON BALSAMINÆFLORUM ALBUM.—This beautiful garden hybrid is now beautifully in flower in Messrs. Veitch's nursery. It seems to be quite a winter-flowering species, as I have seen it for the last two or three years in flower in the month of December. The flowers, produced in large trusses, remind one of those of the Tuberose. The flowers last much longer in good condition than those of the single-flowered varieties. There is also a variety with bright yellow flowers, and the flesh-coloured variety is named *carneum*. The flowers must be exceedingly valuable for cutting to make up into all sorts of bouquets, large or small. They are certainly very valuable for decorative purposes when grown on the plants. A few of the best never single-flowered varieties at present in flower are—*Ophelia*, rosy-salmon; Lord Wolsley, rich orange; Princess Christian, yellow; *Thetis*, yellow, reddish centre—very fine variety; *Empress*, salmon-red and rose-colour. *J. D.*

STACHYS TUBIFERA OR CHINESE ARTICHOKE.—We have been amused at the suggestions from various sources of a popular name for this plant, and with due deference to all that have appeared, we think it will still be found that the "Chinese," or perhaps more correctly speaking, the "Japanese Artichoke" is the most appropriate title. It is fully certain, both in the general appearance of the tuber and the habit of reproduction—in fact, in all essential particulars in its growth—the plant has a great deal of the character of the tuberous-rooted Artichoke, and we therefore are of opinion that the name either Chinese or Japanese Artichoke meets every requirement. *James Carter & Co.*

ARDSIA MAMILLATA.—This distinct species, figured in the *Gardeners' Chronicle* December 31, 1887, p. 809, is now to be seen in berry in Messrs. Veitch's nursery at Chelsea. The foliage is exceeding pretty, of a beautiful grass-green, the upper surface thickly studded with small teat-like elevations or mamillæ. Both in foliage and in its dwarf habit it is superior to the old well known *A. crenulata*, and, like it, it is well furnished with its glossy coral-red berries. It is said to be furnished with berries all through the winter. It is certainly the most seasonable plant recently introduced. It has been introduced by Messrs. Veitch from the Botanic Gardens, Hong Kong, and requires close culture. *J. D.*

ANTHRACITE COAL.—I have now for some seven years made a study of the use of this kind of fuel, and I have also compared its price with that of coke, and the result of my experience has been such as to lead large consumers, like Mr. C. Dorman and Mr. Cobb, of Sydenham, to make use of the coal, and many others have adopted it. Those of the consumers who have large collections of Orchids, which need considerable amount of heat, could tell exactly what a saving it has been to them. I have tried many different sorts of anthracite coal, but have decided in favour of that of Mr. Essery, of Swansea, which is supplied in large blocks. The first cost of the coal is not high, but the heavy fare the railway companies charge for carriage brings it to about 17s. 9d. to 18s. per ton, delivered at Penge Station; Then we have to put on 1s. to 1s. 9d., according to the distance to which it has to be carted. At Sydenham coke rules at from 8d. to 1s. 1d. per cwt., which is equal to 13s. 4d. and £1 1s. 8d. per ton, which, with 2s. per ton for delivery, makes it as dear as anthracite, and, moreover, the coke has lost three-fifths of its heat-giving properties. In using the anthracite coal, I have found it very necessary to have a furnace with a good draught, and to see that the coal is fully consumed. The way to do this is to examine the ash-heap after removal from the furnace, and exposed to a shower of rain, when, if the heap looks black and glistens, then you know that a better draught is wanted, or that your men have been raking the fire, as is customary with coke fires. A fire made up in the morning with this coal does not want touching till night, and if the fuel is not piled on in large quantities it will give a bright flame. It is a mistake to

block up the furnace, as is done, with coke. *Thos. Christy, F.L.S.*

INSECTS ON FRUIT TREES.—In some parts of Gloucester, Hereford, and Worcester, the Apple crop of the past season was much injured, and in some places utterly destroyed by the caterpillars of various moths, the ermine moth and the winter moth being especially destructive. With the view to protect my fruit trees from the egg-laying, wingless, female moths, I put cat-grease and tar round the stems of the trees, thus trapping thousands of moths; but in their efforts to get free some have evacuated their eggs on the tar. Will you or some of the numerous readers of your valuable paper, be good enough to inform me how I can destroy the eggs? I can scrape many off, but many will be left. A solution of corrosive sublimate, or sulphate of copper, would destroy their fertility, but I hesitate to use so drastic a remedy, lest I should injure the bark of the trees. *A. B., Dymock, Gloucester.* [Put more tar or grease on the strip of paper fixed on the trees. Ed.]

CHRYSANTHEMUM MRS. COBAY.—I have no doubt but that the explanation of the above obvious error suggested itself to the mind of one so well informed on Chrysanthemums as "E. M." I was naming the varieties of incurved Chrysanthemums that came under the Prince of Wales type, and what I wrote was as follows: "They are the new varieties described above, viz, Miss M. A. Haggas and Miss Violet Tomlin; Mr. Cobay and Mrs. Heale." A semicolon should appear before Tomlin, and Mrs. is a misprint for Mr. Cobay. *R. D.*

PLANTING HERBACEOUS PLANTS.—I have read with interest the remarks of your correspondents, Messrs. Horsfield and Jenkins, on herbaceous plants and borders. The method of planting in lines of this or that plant I can hardly approve of. To my notion it is better to plant patches—that is to say, a good quantity of one variety in a certain place in the border, with an equal quantity of another suitable plant in fairly close proximity to it. The autumn-flowering *Anemone* may be taken as an instance; of these we grow three distinct colours, the white variety, that called *elegans*, and *A. japonica*. Now to put out these plants in straight lines would not only annoy any person of good taste, but it would, in my opinion, spoil the whole arrangement. I rather incline to having good breadths of one thing with suitable colours to harmonize; and to disregard the height provided the smaller things are not crowded by them. It is now ten years since I formed a border some 100 yards long and 10 feet wide, and planted it with about 200 species and varieties; and since that time the soil has never been dug, but the weeds have been removed by hand, and an annual top-dressing afforded of good loam and burnt earth mixed with a quantity of spent Mushroom dung. That this kind of treatment suits the plants is proved by the abundance of flowers that are cut annually. In the space of this note the names of the plants cannot be given; suffice it to say that we despise nothing, but if a plant is considered weedy, or too rampant, it is consigned, not to the rubbish heap, but to a spot in a wood which is set apart for the purpose. Then we are constantly widening the border, selecting new sites for certain subjects, giving those that are doing well more space to grow, and affording suitable soil, &c., for any that may not be giving satisfaction. One of the best of recently introduced border plants is *Heuchera sanguinea*, figured at p. . . The plant is easily raised from seed, and will flower the first year. I think there is more pleasure in getting together a collection of these hardy plants and watching them thrive than there is in the ordinary short lived summer bedding plants; nevertheless, I am not an advocate for neglecting this or any other department of the garden. *C. Morritt, Hoo Gardens, Kimpton, Welwyn.*

## PLANT PORTRAITS.

## FLORISTS' FLOWERS.

## THE RANUNCULUS.

I CAN look back with pleasure upon a very large border containing several thousands of Ranunculus plants in full bloom last year in June. As an example of a florists' flower the double Ranunculus is a model of form, and it certainly surpasses all others in the variety and brilliancy of its colours. Unfortunately much of the good work done some fifty years or more ago by the Rev. Joseph Tyson, of Wallingford, Berks, has been lost, and is now almost forgotten. I can remember some of his richly coloured and beautiful flowers. Many persons grew a bed or more of them, but many of the colours are not to be seen in a modern collection. There were black and white varieties; purple and violet; orange, yellow, and straw-colours; crimson, red, and rose; others were spotted, striped, or edged like Picotees; the colours scarlet and gold, mixed, being very pretty. We have many raisers of Auriculas, Carnations, Dahlias, Tulips, &c., but though the Ranunculus can be raised as easily as any of them from seeds, no amateur that I know of has of late taken it under his protecting care.

In former days florists would give a guinea for a single tuber of a scarce variety of Ranunculus; now a good-sized bed can be obtained for that sum. Most of the Continental varieties, sent in mixture, and sold at a cheap rate, are of good form, but they lack brightness and variety of colour. The bed to be planted with the roots should be prepared at once, if it is not already done. They like a rich, deep, clayey loam, which ought to be kept in a moderate state of moisture. Ordinary kitchen garden soil suits them admirably. I plant any time when the weather is favourable, either in February or March. The bed, or border, is made quite level, and the rows are marked out by pressing an inch board into the soil about an inch and a half; this makes the bottom of the drill quite level. Place the tubers in it with the claws downward, and cover over with fine soil; the tubers may be planted about 3 inches apart, and 4 inches between the rows. Put a pinch of sand over each tuber, and cover with fine soil.

Seedling raising may be practised in any garden, however limited. It is most interesting amusement to raise seedlings of any florists' flowers, the Ranunculus particularly so. It requires two types of Ranunculus to raise seedlings from. Pollen may be obtained from double flowers, the more double the better. Seeds must be saved from semi-double varieties, or from semi-double approaching to doubleness. Commence to cross the flowers as soon as they are fully open. Ten o'clock in the morning is a good time to perform the operation of hybridising; I generally go over them twice daily—in the morning at ten, and in the afternoon from one to three. When the impregnated seed-vessels begin to swell, the stems should be tied to a neat stick, to prevent their being broken; and when the seeds are about ripe, which can be observed by the seed-vessels turning brown, they ought to be gathered, and laid out on paper in a dry airy place. The seeds may be sown early in January in shallow boxes or seed-pans. The compost should be three or four parts loam to one of leaf-mould, and a little fine sand to keep the whole porous. Make the surface quite level, and sow thinly, using just enough fine mould to cover the seeds. The pans or boxes should be placed in a frame; but this is not absolutely necessary, as Mr. Tyson recommended placing them under a north wall, merely protecting from heavy rains. Frost, however, is injurious, so that it is much better to have them under glass. The young plants will appear in a month, and as they advance in growth give plenty of air. The lights may be removed altogether in May, or the boxes containing the plants should be turned out-of-doors, not exposed too freely to the sun, as this might be injurious by causing the leaves to wither prematurely. They ought not to decay until July, and as soon as they do decay take the small tubers out of the ground,

and store them in a dry cool place in dry sand. Plant them out in February with the old roots, at the same depth, and the same distance apart. They will flower as well, or perhaps more strongly, than the old tubers. Peaty soil of some kinds is excellent for growing the Ranunculus in. Mr. Simonite, of Sheffield, told me that the best bed he ever saw was in a small garden in the corner of a peat moor, where the soil was nothing but sandy peat. I tried the experiment of planting the tubers in beds of the usual Heath and Azalea peat, and it answered admirably; but one season something was wrong with the peat, and half the plants died, while the other half made but poor growth, and flowered badly. In dry seasons water should be applied freely, as their growth is stopped directly if they become very dry at the roots; but they do best in a wet season, as we never had a better bloom than last year; natural showers suit them much better than artificial ones. An important point in their culture is to take up the tubers as soon as the leaves become yellow; if they are allowed to remain in the ground they will start into growth almost immediately. *J. Douglas.*

## TUNISIAN DATES AND THE PRODUCE OF THE CORK FORESTS.

THE British Consul at Tunis describes the Dates of that country as much superior to those produced in any other part; "and yet," he says, "they are little known in England. Their great abundance and their cheapness make it difficult to understand why a large commerce is not carried on in this fruit. They are the produce of the extensive oases in the south of Tunis, those of Jerid and Tazeur being the most extensive. The Date Palm grows all over the Regency, but the few trees met with in the north do not ripen their fruit from want of the requisite heat. Even the Palm Trees of the oasis of Gabes, situated in lat. 34°, produce an indifferent fruit, owing to its proximity to the sea, which reduces the temperature of the air. The Arab saying is that the Date Palm loves to have its feet in the water and its head in the fire, which graphically expresses the craving of this tree for moisture and heat. The best quality of Date is that known by the name of Degla, which is large, tender, very sweet, with skin unwrinkled, and of a golden brown. These are exported chiefly to France. In the market at Tunis this quality sells retail at 3d. a pound.

As steamers coming direct for Liverpool call at Gabes for Alfa, it is surprising that a more extensive trade is not carried on in this fruit. It constitutes the principal food of the Arabs, the Oasis of Tazeur alone producing annually about 16,000,000 lb. The average annual exportation does not exceed a value of £12,000."

Referring to the Cork forests of Tunis, it is stated that these forests, situated in the north, near the Algerian frontier, have only recently been taken in hand by the government. The surface covered by the forests amounts to 300,000 acres, and forms part of the State domain. The sale of trees last year, it is said, realised as much as £15,000. The duty formerly imposed on this product has just been removed. In the course of a few years a considerable revenue will be derived from the cork, which, as the trees have only recently been begun to be stripped of the virgin bark is not yet of mercantile value.

## MARKETS.

COVENT GARDEN, December 27.

Nothing doing, owing to the holidays. *James Webber, Wholesale Apple Market.*

## CORN.

Averages.—Official statement showing the average price of British corn, imperial measure, in the week ended December 22:—Wheat, 30s. 8d.; Barley, 26s. 11d.; Oats, 16s. 3d. For the corresponding week in 1887:—Wheat, 30s. 10d.; Barley, 28s. 11d.; Oats, 16s. 7d.

## NOTICES TO CORRESPONDENTS.

INTELLIGENT READERS, DO PLEASE NOTE that letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the PUBLISHER, and that all communications intended for publication, as well as specimens and plants for naming, should be addressed to the EDITOR. Such communications should be written on one side only of the paper, and sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

BOOKS: *Lady Storey. The Orchid Grower's Manual*, by B. S. Williams, Victoria Nurseries, Upper Holloway, London, N.—*P. Plant Life* (Bradbury & Co.), or the articles in Cassell's *Popular Gardening*.

BOUVARDIAS STRIKING IN MOSS: *Psychotria*. We have no experience of this method of raising the plants. It answers with such widely different plants as double-flowered Primulas and Indian Azaleas, and may be equally successfully applied to the Bouvardia.

CAMELLIAS: *E. W.* As the hot-water pipes have been "varnished," it is very probable that the fumes of the coal-tar and naphtha, used in the preparation of this coating, are the cause of the leaves falling. No. 1. The flower-buds may fall off from the same cause, or from bad potting, as you say the soil is not made firm. When the potting soil is not made firm, the water scarcely wets the old ball, but passes away through the new soil. The growth is

stunted and thin, indicating a starved state of the plant. No. 2 shows worse conditions than No. 1. The temperature of your house is right. Burn off the varnish at once—but first taking all plants out of the house, and repot the *Camellia* plants now; there would be no harm done under the circumstances, and should the old balls of soil be found to be dry, soak them for some hours in water before repotting. Use sandy loam, burnt earth, with a little leaf-mould

**DUCHY OF LUXEMBOURG:** *T. J.* There is no book that we know of treating of the climate, soil, &c., of the Duchy. The high land, consisting of a part of the Ardennes, is composed of calcareous soil, and grows nothing but timber, Rye, Oats, and Potatoes; the lower lands are very fertile. A poor wine is made on the banks of the Moselle and Sûre. Great numbers of horned cattle and sheep are found in the lowlands. We should think it well adapted for commercial fruit growing.

**NAMES OF PLANTS:** *G. Mantin.* 1, *Catasetum longifolium*; 2, probably a *Lockhartia*, but the lip (the important feature) is withered; 3, specimen insufficient; 4, *Epidendrum inversum*; this is more like what a specimen should be, if it were only fresh; 5, not recognisable; 6, *Masdevallia*, probably *nidifica*; but why send such a dried-up specimen? 7, *Oncidium* sp.; 8, was hardly large enough for us to see whether it was a flower or not. You must really send better material in all cases.—*W. W.* 1, *Pinus Laricio*; 2, *Pinus Laricio* var.; 3, *Pinus Pallasiana*; 4, *Picea Morinda*.

**ROMNEYA COULTERI:** *T. G. C.* See "Answers to Correspondents," p. 680 of our issue for December 8 last.

**TURNIPS:** *W. and J. Brown.* The roots sent show clear signs of hybridisation having taken place between the Swedes and Turnips. The flesh of the hybrids, which is firm and sweet, partakes in colour of the Turnip, but the foliage is more like that of the Swede, whilst the flavour is about intermediate between the two. If the Turnip has not imparted tenderness to the bulbs no great harm would seem to be done.

# STANDEN'S

Established  
Over 20 Years.

## MANURE

Exceeds all others in general fertilising properties and staying powers.

It promotes a rapid, healthy, and robust growth to plants generally.

It is a clean and dry powder, with very little smell. It is consequently particularly adaptable for ladies interested in plant culture.

The highly fertilising properties of this Manure render its money value, in comparison with other manures, at least double; and users will find that very small quantities will produce favourable and lasting results.

Sold in Tins, 1/-, 2/6d, 5/6, and 10/6 each; and in Kegs (free) at Reduced Prices, 28 lbs., 12/6; 56 lbs., 23/-; 112 lbs., 42/- each.

SOLE MANUFACTURERS:

**CORRY, SOPER, FOWLER & CO.**  
(LIMITED),  
16, Finsbury Street, London, E.C.

SOLD BY ALL SEEDSMEN AND NURSEYMEN.

# HILL & SMITH'S BLACK VARNISH

for Preserving Ironwork, Wood, or Stone.

(Registered Trade Mark.)

An excellent substitute for oil paint, at one-third the cost.  
Used in all London Parks, at Windsor, and Kew Gardens,  
and on every important estate in the Kingdom. Has stood  
the test of forty years' trial, and requires no mixing; can  
be applied cod by any ordinary labourer.

Price 1s. 6d. per gallon at the manufactory, or carriage-paid  
to any railway station, 1s. 8d. per gallon in casks of 36, 20, or  
10 gallons.

**CAUTION.**—Every Cask bears the above  
Registered Trade Mark. Beware  
of cheap imitations.

# HILL & SMITH,

Brierley Ironworks, Dudley;  
118, Queen Victoria Street, London, E.C.;  
47, Dawson Street, Dublin.

Made in superior earthenware, 14 in. long, 6½ in. deep, and 5 in.  
wide. Inside, 2½ inches from the top, is a perforated movable  
false bottom, upon which the soil for cuttings or seeds is placed,  
the lower half being filled with water, which is replenished  
when required through the funnel. It fits evenly on 4-inch  
hot-water pipes, and will be found a simple and effectual means  
of utilising them for propagating purposes. With the false-  
bottom removed it forms an effective rapeseed. Price 3s. each;  
six carriage and package free to any station in Great Britain  
for £1 1s.; or two for 8s. 6d. Sole makers and patentees,

## Estate Sales.

The best County method of Advertising Sales of Estates is

**THE WORCESTER HERALD,** the largest and leading County paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to insert for reference and distribution, plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other property advertised in the columns of the *Worcester Herald*. Specimen copies sent free. Published Friday for Saturday, price 2d.

Offices, 72, High Street, Worcester.

## Sales of Stock and Agricultural Effects.

**THE WORCESTER HERALD** is the most effective organ for giving publicity to announcements of this class. It is the largest and leading Agricultural paper in the county, and circulates most extensively among Agriculturists in and around Worcestershire. Specimen copies free. Published Friday for Saturday, price 2d.

Offices, 72, High Street, Worcester.

## Farms to be Let.

LAND AGENTS, ESTATE MANAGERS, and all having Farms

to Let, would do well to advertise in

**THE WORCESTER HERALD,** the Largest and Leading County Paper. Specially adapted for bringing such notices before tenant Farmers. Large Circulation, moderate charges. Specimen free. Price 2d. Published Friday for Saturday.

Offices, 72, High Street, Worcester.

## GARDENING APPOINTMENT.

Mr. J. FOLKARD, for the past seven and a half years Gardener to W. B. RICHARDSON, Esq., Elm Bank, York, has been appointed Head Gardener to Sir JAMES R. WALKER, Bart., Sand Hutton, York.

**WANTED, a GARDENER and WIFE,** without children. Man must be a thoroughly good all-round Gardener, and will have to overlook Cowman with ten or twelve cows, and several acres of land, pay all wages, and generally Superintend the Estate. Wife to undertake Management of the Dairy and Poultry. Must both be especially well recommended for trustworthiness, sobriety, and ability. Wages for the man, 24s. per week, house, firing, and vegetables; and for the wife, 20s. per month. Apply stating wages and all particulars, to EWING and CO., Sea View Nurseries, Havant, Hants.

**WANTED, a NURSERY FOREMAN and PROPAGATOR,** from 30 to 35 years of age, experienced in Growing Pot Plants and Cut Bloom for Covent Garden. Only those need apply who can give exceptional references.—Address by post, to Mr. C. H., Messrs. Chas. Barker & Sons, 8, Birch Lane, E.C.

**H. CANNEL and SONS** are in WANT of a thorough professional ROSE GROWER. Must know them well, and be able to propagate them in large quantities. It is a permanent place, therefore must have the highest character.—Swanley, Kent.

**WANTED, a single MAN,** not above 35; must thoroughly understand Growing under Glass Strawberries, Cucumbers, Tomatoes, &c., for Market.—Apply by letter, with particulars of experience and reference, and wages required, to W. T. CLINCH, Rowe's Farm, Hayes, Kent.

**WANTED, a young MAN,** not under 22 years of age, used to Growing Grapes, Tomatoes, &c., for Market. Only those need apply who have good character and abilities. Wages, 18s. per week, overtime paid. State where to apply for character.—Apply E. RIDER, Orpington, Kent.

## WANT PLACES.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

**To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BAILIFFS, or GARDENERS.**

**JAMES CARTER and CO.** have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter. Enquiries should be made to 237 and 238, High Holborn, W.C.

## Gardeners, Foresters, Land Stewards.

**R. B. LAIRD and SONS** can recommend with every confidence Scotchmen thoroughly qualified as GARDENERS, FORESTERS, or LAND STEWARDS, either for large or small establishments, and will be pleased to furnish full particulars on application.—17, Frederick Street, Edinburgh.

## RICHARD SMITH and CO.

beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

## GARDENER (HEAD).—Age 31, no incum-

brance; Scotchman. Seventeen years' practical experience in all-round gardening. Abstainers. References, &c.—ROSS, 11, Beaconsfield Terrace, Perry Hill, Catford, S.E.

## GARDENER (HEAD).—Energetic; tho-

roughly trustworthy. Very highly recommended. High-class cultivator of Fruit, Oranges, Store and Greenhouse Plants, Flowers, and Vegetables.—M., 81, Balham Grove, Balham, S.W.

## GARDENER (HEAD); age 40, married;

26 years' experience in Vines, Pines, Peaches, Melons, Cucumbers, and all kinds of Store and Greenhouse Plants, Orchids, and the Management of a Garden. First-class references. Wages, &c. LUCAS, Roach Pond Field, Manor Road, Braintree, Essex.

## GARDENER (HEAD), age 32.—R. WESTCOTT,

Head Gardener to his Grace the Duke of Cleveland, Raby Castle, Darlington, Durham, will be glad to recommend his Foreman, J. Tullett, to any Lady or Gentleman requiring a thoroughly practical, good gardener. First-class man in every department. Sixteen years' experience. Seven years General Foreman at Raby.

## GARDENER, where one or more are kept.

"Thoroughly experienced in Fruit, Flowers, and Vegetables. Good character. Good references.—J. L., 3, Mr. REYNOLDS, West End, Metheringham, Lincoln.

## GARDENER (good SINGLE-HANDED), or

years' help is given.—Age 23, married, no family; six years' good references from previous employers.—J. WILD, Clifton Road, Netheresale, Ashby-de-la-Zouch.

## GARDENER (SECOND).—Age 22; eight

years' good character.—WALTER HILL, The Lawn Gardens, Swindon, Wilts.

## FOREMAN and PROPAGATOR in a

London and Provincial Nursery.—Thoroughly experienced in the Trade. Efficient in Cut Flowers, and general Gardening. *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

## PROPAGATOR and GROWER for Market or

Cut Flower and Plant Trade.—K. A. E., 4, Victoria Street, Lincoln.

## JOURNEYMAN, Inside and Out, if required.

Age 19; good experience among Plants and Outside Gardening.—W. J. B., Goldings Hill, Loughton, Essex.

## JOURNEYMAN, in the Houses; age 24.—

A. BYRER, Clerk-of-Works to Sir Wm. Ogge, Oakfield, South Dulwich, desires to recommend an energetic, painstaking young man as above.

## JOURNEYMAN, in the Houses; age 25.—

W. H. LESLE, The Gardens, Healesley, Bellingham, Northumberland, will be glad to recommend Edward Slate (who has been with him three years), to any Head Gardener in want of a trustworthy young man.

## SHOPMAN (JUNIOR), with good knowledge of

all Seeds, Bulbs, &c., desires engagement. Active and willing.—A. T. HAMILTON, 11, Cannon Street, Edinburgh.

## TO FLORISTS and NURSERYMEN.—A

Lady, age 26, requires a situation in a Florist's and Nursery Business. Understands Book-keeping, and has a good knowledge of Plants. Good references. Apply to Mr. W. H. LESLE, Maker. Please address, M. S., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

## HOLLOWAY'S PILLS.—IMPURITIES OF

THE BLOOD.—To insure health it is absolutely necessary that the fluids and solids of the human body should be kept free from those impurities which are continually getting into the system, through erroneous living, unwholesome atmospheres, or disordered stomach. The only safe and certain way to expel all impurities is to take Holloway's Pills, which have the power of cleansing the blood from all noxious matters, and at the same time removing any regularities which their presence may have already produced in any organ. Holloway's Pills expel all humours which taint or imperish the blood, which they purify and invigorate, and give general tone. They are applicable to all ailing, young and old, robust or delicate.

# FOSTER AND PEARSON, BEESTON, NOTTS.

### TESTIMONIALS.

From Right Hon. LORD BURTON, Rangmore, near  
Burton-on-Trent.

"Messrs Foster & Pearson, of Beeston, near Nottingham, have put up a number of houses for us, both in Staffordshire and Scotland. We have every reason to be highly satisfied with the style and quality of their work, especially as compared with that of others whom we have previously employed. Their charges appear to be reasonable—BURTON."

From J. W. BURGESS, Esq., Architect, Chislehurst, Kent.

"Gentlemen,—I am exceedingly pleased with the Conservatory you have erected here."

## NEW PEA, "SHARPE'S QUEEN."

Our New Pea—Queen—in habit, cropping qualities, colour and flavour is the perfection of a Pea for every purpose, and by successive sowings, so continuous a crop can be obtained, that it will be almost unnecessary to cultivate any other variety. The Queen is a blue wrinkled Marrow Pea, about 2 to 2½ feet in height, of a sturdy branching habit; it requires to be sown thinly, as the pods are produced from the very bottom of the plant to the top. The pods are

large, green, slightly curved, and so filled with Peas that when opened it would appear impossible they could be contained in the pod. The Peas are large, oval, deep green, and of a delicious flavour when cooked.

We feel we cannot say too much in its praise, and are confident our customers will agree with us that it is one of the very best Peas ever sent out.

Price 2s. 6d. per Pint Sealed Packet; 1s. 6d. per Half-Pint Sealed Packet.

For full description of the above, see *SHARPE'S SEED LIST* for 1889, Post-free on application. Trade Prices on demand.

**CHARLES SHARPE & CO., SEED GROWERS AND MERCHANTS, SLEAFORD.**
